
INSPECTS PLANT — Maj. Gen. Emmons visits San Diego aircraft plant to view new Army bomber.

Emmons Sees Great Bomber

Air Corps Commander Watches Third Test Flight at San Diego

SAN DIEGO, Jan. 16.—French and Brazilian military officers today stood on the side lines only a few paces away from Maj. Gen. Delos C. Emmons, commander of the Army Air Corps G.H.Q., as the Army's most powerful completed bomber, the four-motored Consolidated XB-24, was given its third test flight on Lindbergh Field.

The foreign observers were here to confer with Consolidated officials in connection with possible acquisition of flying equipment available for export. The local concern manufactures long-range navy patrol boats, as well as giant army planes.

Maj. Gen. Emmons spent several hours inspecting the Consolidated plant and left late today for March Field to observe the G.H.Q. first wing's participation in this week's joint Army-Navy maneuvers which will test California's vulnerability to invasion.

He arrived this afternoon in a Douglas Army transport from his Langley Field (Va.) headquarters. Accompanying him are Capt. W. Goss, pilot and aide; Maj. H. A. McGinnis of the Inspector General's Department and Lieut. Col. Cedric Lewis, signal officer of the G.H.Q.

Air Force Commander Arrives at March Field

MARCH FIELD, Jan. 16.—Maj. Gen. Delos T. Emmons, commanding general, G.H.Q. Air Force, arrived at March Field at 4:25 p.m. today accompanied by Col. A. S. Pederneiras of the Brazilian Air Force. He was accorded a 13-gun salute. Gen. Emmons tomorrow will visit airplane factories in Los Angeles.

HITLER'S AIR PLANS

Building up his Bomber Forces

From Our Air Correspondent

LONDON, Tuesday Night

TO expect the worst and to prepare to meet it is the only sound defensive maxim and it should be rigorously applied at the present time Things have been going well in the Middle East and in Greece, but that does not mean that we should expect them automatically to begin to go well here.

Rather the expectation should be that there will be further and heavier attacks. For although there have been lulls, there has been nothing to suggest that they are of other than tactical origin. On the contrary, the easiest way to interpret them is as periods of recuperation for the *Luftwaffe* to be followed by more intensive action

It is true that, since Friday last, the Royal Air Force has been making raids on German-occupied aerodromes in France and Holland, but I doubt if such raids could do more than diminish very slightly the scale of the attack. The reason is that the Germans enjoy the use of a huge number of aerodromes, both in Germany and in occupied territory.

MANY AERODROMES

In France alone the number must be about 500, and of these a fairly high proportion would be well suited as bases for the night raiders. In Holland and Belgium there are more aerodromes, and behind them, more difficult to reach for our bombers, there are the German aerodromes, of which there must be more than 600.

It is obvious that the task of attacking so large a number of aerodromes that the enemy would be unable to launch his night raids is so immense that no air force could undertake it. The most that can be hoped for is that some of the aerodromes which are most useful to the enemy shall be knocked about, and this, it seems, was successfully done.

The lulls in night raiding may have been partly caused by these attacks, but that is all. For the rest, they may be due to the desire on the part of the enemy to conserve his bomber forces and to build them up to greater strength for some coming offensive of great ferocity.

The *Luftwaffe* has had heavy losses during the summer and autumn. It has, moreover, measured itself against the R.A.F. and found itself relatively less strong than it had thought. Field-Marshal Goering keeps a wary eye on our production and knows that it is swinging up and being augmented still further by United States production.

Yet the attempt to defeat Great Britain in these islands cannot have been abandoned as a primary German objective. It would be the key to saving Italy, it would fulfil Herr Hitler's dearest ambition, it would sort out all the Axis troubles. But to defeat Britain in these islands the Germans now know that a bigger effort than anything they have so far been able to put out is needed.

So they use this period for weakening us so far as they can by submarine warfare and by intermittent night raids, while not risking great numbers of their aircraft in day raids or in night raids when the weather is such that the number of accidents seems likely to be high.

Night flying under war conditions always entails many accidents, and it is surprising what heavy losses a night bomber force can suffer from this cause alone. The *Luftwaffe* bombers may have been depleted by accidents on a big scale during their attempts to sustain the bombardment of these islands during spells of bad weather.

At any rate, the present method does enable aircraft to be conserved and gives Field-Marshal Goering a chance to build up his forces. And that, I think, is the interpretation of it. There may be moves of some machines to another theatre, but if the aim is to strike in the Balkans or the Middle East the conservation and hoarding tactics are still needed. They would not be forced upon the Germans by a move because the aircraft do not take long to shift; it is the ground equipment that takes the time.

Our object then must be to prepare energetically to meet a new German air offensive. To that end we must increase the strength of the Royal Air Force and push forward with technical improvements. Higher speeds and better climb are the needs, for if we beat them once by technical merit we can beat them again by the same means.

It is clear that we have been able to reinforce our Air Force in the Middle East and also to lend fairly substantial air aid to the Greeks. We have been using not only the Gloster Gladiator fighters in those theatres but also the later Hurricanes. In addition, we have used Blenheims in fairly large numbers and some of the Wellington heavy bombers.

STILL MORE 'PLANES

But what we have done in the past in the way of increasing our air strength must be overtopped in the future if we are to meet with full confidence the coming attack wherever it may be launched. Moreover, there is always our own offensive to be considered, for it comes nearer and nearer to the range of practical possibility. So that not only must our fighter forces be enormously increased but so must our bomber forces.

Especially important will be the coastal reconnaissance types of aircraft and the torpedo-carriers. If, as has been suggested, we are to get some of the Consolidated 31 flying boats from America they should be of the greatest help to the Coastal Command in dealing with the submarine menace and also with the menace of the surface raiders.

Civil Aeronautics Authori

BIRTHDA

Robert N. Hinckley, Chairman. Term of office expires 1943.

By Robert H. Hinckley

Chairman

WHEN the members of the Civil Aeronautics Authority, the Administrator and the Air Safety Board took the oath of office slightly more than a year ago, we found ourselves confronted by a threefold task which in all conscience seemed large to us. We were charged by Congress and the President with the new duty of economic regulation as applied to civil aeronautics; we inherited the duty of providing, maintaining, extending and improving the aids to navigation of the common air; we were charged, and in a very particular way this bore upon our conscience, with the duty of increasing the safety, and therefore the utility, of all flying.

Statistics on Growth

Just to indicate what this growth has been, the scheduled air lines in the month of June carried 164,578 passengers, 64¼ percent more than June a year ago. During the first six months of this year, 1627 airplanes were produced for domestic civil use in the United States, only about 40 of them going to the airlines, the rest being purchased and used by private and non-scheduled flyers. Compared to the first six months of 1938, when 850 civil airplanes were made and sold for domestic use, this is an increase of over 90 percent in production and sales.

Today 26,144 pilots hold certificates, 6,000 more than a year ago, an increase of about 30 percent. There are 11,160 certificated airplanes today, 1,400 more than a year ago or an increase of almost 15 percent, an increase that will be moved startlingly upward by the production figures of the first six months if they are maintained on an annual basis.

The increase in pilots according to every indication of our charts will be even more startling. Even without the Authority's own pilot training program, the curves show that there would be 36,000 certificated pilots by the end of 1940, and 43,000 by the end of 1941. Taking into account the student pilot training program, however, the number of pilot certificates in force by the end of 1941 ought to approximate 70,000 of all classes.

Airways Extended

The federal airways within the United States have been increased by about 10 percent in length to a total now over 25,000 miles. The aids to navigation along these airways have been increased by about the same amount. But that is not as good a measure of their increased usefulness as is the almost complete modernization of existing radio and other aids and the plans now under development for their possible conversion into the new ultra-high frequency category, where they will become even more useful and reliable.

Perhaps no occurrence within this year is of more importance to the United States than the extension of our foreign lines across the North Atlantic, where for the first time, under the American flag, airplanes are flying regularly twice a week between here and Europe. Plans have been proposed for the further extension of our lines in the east to New Zealand. Our flag now flies in the air from Nome, Alaska, to Buenos Aires in the Argentine, and from Hong Kong, China, to Marseilles in France.

Backing up all of these extensions and additions to our civil aviation plant, the Authority is at this moment, thanks to the $4,000,000 appropriation in the Third Deficiency Bill, actually making the arrangements for the training of 10,000 student pilots next year by methods we know through test to be methods that produce safe pilots.

Air Traffic Regulation

Congress, in the Civil Aeronautics Act of 1938, recognized for the first time that air transportation had become a utility whose economic soundness was of sufficient importance to the people as a whole to warrant its regulation in a fashion long familiar with public utilities.

The existing system of scheduled air mail carriers is now legally a public utility. All of the certificates under the so-called "grandfather clause" of the Act have been issued to the air mail carriers after the fullest investigation of the adequacy and efficiency of the services they have rendered. This has not been a merely routine procedure. Under the new decisions affecting the validity of administrative law, it was necessary to make court-proof records in all of these determinations. A good result of that necessary step has been the development of a mass of information on air line operation which will be invaluable in the determination of cognate actions.

of the time element. Yet the almost traditional tooling was in for a change.

With the problem of tooling demanding solution, another cropped up. Airplane construction, to save weight in the finished structure, naturally brings about the accumulation of considerable scrap from the trimming and lightening operations. With the increased orders, and these are all-metal craft, what to do with the quantities of scrap became a problem, along with the tooling.

The two problems were solved at once, for Consolidated now melts its scrap dural, casts it into suitable slabs and special shapes, and employs it for tools, fixtures, etc. The dural has several advantages in its favor as compared with wood and steel. It is almost as easily worked as wood, and does not warp or swell. It is far less costly than steel, is lighter to handle in the form of fixtures and jigs, and, best of all, its coefficient of expansion is that of the work itself. It cannot produce inaccuracies due to changes in temperature. Bolts may be tapped into it for assembly purposes, and hardened bushings pressed in for drill jigs and the like. By machining the slabs and shapes to close sizes, assembly work on jigs and fixtures is quite simple. Machine tools, of course, handle it with ease, and it may be hand-worked almost as readily as wood. Thus a phase of the tooling and production work, which a short time ago relied upon wood mill equipment, has swung to machine tools, which illustrates the flexibility necessary for adapting facilities to meet changing conditions.

The large aircraft of today, such as those built by Consolidated,, are intricate planes involving a considerable time to design, engineer and construct. And the material developments and aerodynamic and mechanical advances come so rapidly that the elapsed time from the conception of a new design to its first flying is of vital importance. The prototype, or first plane of a design in one of these large craft, with its complex structure and problems of fabrication and testing, can reasonably be expected to consume from a year and a half to two years or more between the tim

CONSOLIDATED SET FOR FOREIGN PLANE JOBS

SECRET ORDERS FOR 250 WAR CRAFT DENIED

Firm Only One Whose Machines Could Fly Atlantic Safely

By HAROLD KEEN
Aviation Editor.

While scoffing at reports that the company had secret orders from both England and France, Consolidated Aircraft Corp. officials today emphasized that their concern is probably the only manufacturer in the United States all of whose products could be delivered over any ocean in the world.

The Consair executives categorically denied that foreign orders were already on the books and had only awaited the arms embargo repeal to signal full speed ahead on actual production.

Announcement in a recent aviation trade journal that the San Diego company had a contract for 250 planes for Great Britain was described as inaccurate.

DELIVERY RECALLED

Significant in connection with any reports of aircraft work for England is the delivery, several months ago, of a PBY-type patrol bomber to the Royal Air Force on a flight across the United States to Botwood, Newfoundland, and across the Atlantic to Britain.

In this manner was dramatically illustrated the possibility of ferrying whole fleets of bombers to distant shores—a valuable feature to be considered by foreign governments buying in the United States. Submarines cannot sink airplanes delivered by air.

CITE GUBA FLIGHT

Flight of the Guba, Richard Archbold's Consolidated seaplane, over every major water body in the world on his globe-girdling jaunt which ended last July, is also used by Consolidated officials as a selling point.

It was learned that inquiries which may lead to orders from foreign governments have been made at the Consolidated plant.

With the European field now left open, the San Diego concern is expected to compete with all other manufacturers in attempting to meet the demand for new planes.

SPUR TO BUSINESS

Just how the regulation requiring cargoes to belligerent nations to be shipped in foreign bottoms would affect the method of trans-oceanic delivery by air is a matter for attorneys to study, Consolidated officials said.

That lifting of the embargo will inevitably spur local airplane business was foreseen here. Solar and Ryan plants supply parts for factories in the Los Angeles area which have millions of dollars worth of contracts to fulfill with England and France.

Fleet Air Arm News : Military Aviation Abroad

Higher Appointment

THE Air Ministry announces the appointment of Group Capt. John Walter Cordingley, C.B.E., to assume the duties of Director of Manning, Air Ministry, with effect from July 17.

Group Captain Cordingley, who was born in 1890, joined the Royal Naval Volunteer Reserve in 1905 and in 1918 was appointed to the rank of Major in the Royal Air Force, assuming the duties of Staff Officer, Class 2, in the Directorate of Manning at the Air Ministry.

He was awarded the O.B.E. in 1919, and in the same year was granted a permanent commission in the Royal Air Force with the rank of Squadron Leader. Since 1922 he has been in command of the Record Office, Ruislip, and in the Birthday Honours List of 1937 was promoted to C.B.E.

He was promoted to the rank of Wing Commander in 1924, and to his present rank in 1931.

As Director of Manning he will be responsible to the Air Member for Personnel for planning the man-power requirements of the R.A.F. and for the executive control of recruitment for the R.A.F. and for the Volunteer and Regular Reserves.

R.A.F. Flight Over France

FOLLOWING on the display by Wellingtons and a Hurricane at Evere, on Tuesday, July 11, twelve squadrons of Wellingtons, Hampdens, Blenheims and Battles, numbering in all over 100 aircraft, started off at 08.00 hours from their home stations in the Midlands for a flight over France, which had been arranged by agreement with the French Government.

The long-range craft followed the route Havre, Le Mans, Samur, Bordeaux, Angers, Caen, and so back to England, a non-stop flight of about 1,200 miles. The others followed the route Le Treport, Orleans, Le Mans, and crossed the coast near Cherbourg on their way home, a total of nearly 900 miles. All flew at a height of 2,000 metres (6,500ft.), except when over the larger towns, when they came down to 1,000 metres (3,250ft.) in order to show themselves off to the inhabitants. All the machines returned safely to their home stations. Similar flights are to be made this week.

The arrangement is that French squadrons shall pay a return visit by making a flight over Great Britain—probably it will take place this week.

The Paris Demonstration

ONE squadron each of Spitfires, Hurricanes, Blenheims, Hampdens and Wellingtons joined with Morane 406s, Curtiss P.35s, Potez 63s, Breguet 691s, Bloch 131s and Liore 45s of the French Air Force in a fly-past over Paris preceding the parade in the Champs Elysées last Friday. The fly-past was led by a single-Morane 406, piloted by General d'Harcourt, Inspector-General of the French fighter force. In the first place it was intended that the British fighters should lead, but it was thought that they might experience some difficulty in keeping formation at 175 m.p.h., which was the agreed speed. Instead, the British bombers were in the vanguard, the Spitfires and Hurricanes bringing up the rear and demonstrating their speed by passing the main body as it flew along the Champs Elysées. The squadrons flew at different heights, the lowest being the graceful Potez 63 twin-engined fighter-bombers. In all, 315 aircraft took part, 45 being British. Air Chief Marshal Sir Cyril Newall, Chief of the Air Staff, left for Hendon later in the day in a Percival Q.6.

Distinguished Flying Medal

HIS MAJESTY THE KING has been graciously pleased to approve the undermentioned reward for gallant and distinguished service in Palestine:—

Distinguished Flying Medal.—Sgt. Harry John Goodchild.

On May 23, 1939, Sgt Goodchild located armed rebels near Kh. Wazil and took vigorous air action against them in extremely difficult flying country. The fighter machine which he was flying was subjected to heavy fire from dense coverage, and, after several hits, the air-pressure system was put out of action. Sgt. Goodchild, after flying back to Ramleh, returned to the area in another machine and continued his previous tactics of holding the rebels until the arrival of the British ground forces. He displayed great gallantry, daring and flying skill.

Sgt. Goodchild has taken a conspicuous part in a number of major engagements and his name has twice been brought to the notice of the General Officer Commanding, British Forces in Palestine and Trans-Jordan for distinguished conduct.

The Consolidated Arrives

WHAT is undoubtedly a very fine flying boat arrived at the Marine Aircraft Experimental Establishment, Felixstowe, last Friday. Just how fine a craft it is will be ascertained during the next few weeks.

The machine was a Consolidated 28-5 long-range military boat which had flown non-stop from Botwood, Newfoundland, to Felixstowe.

She left the manufacturers' plant at San Diego, California, at 4.23 p.m. G.M.T. last Monday week to fly non-stop the 3,000 miles to Botwood, Newfoundland, but made an intermediate landing at Buffalo as, having had a 30 m.p.h. wind all the way, fuel was

OVER

Consolidated Air

country. It shows, too, that some of the consequences can be just as serious. Take one remarkable statement of Mr. B. W. Sheahan, one of the chief engineers of the Consolidated Corporation. "We have never," he writes, "had an aeroplane advance from the experimental to the production stage without having out-of-date armament installations."

He goes farther and declares that development has sometimes been so retarded that an aeroplane was often obsolescent by the time it reached production. His company has lately shown what can be done by constructing the prototype Model 31 and getting it flown within ten months. Something of the sort was achieved last year by the de Havilland Co. in building the Flamingo within a year. The latest case is the more striking because the new boat is nearly twice the loaded weight of the Flamingo. How it was done, Mr. Sheahan tells. His description of the time-saving methods will be of interest to everybody concerned with development.

HIGH BIDDING.—Sir Kingsley Wood's incursion into a billet card party during his visit to the R.A.F. in France. Evidently the hosts dealt him a good hand.

But he has perceptive things to say also about those aspects in the control of development by a Government Department which lead to the greatest delay. One of his points is that non-flying features are responsible for most of the conferences, modifications and obstruction. He holds that the armament and interior features might be represented by dummies or ballast, while conferences about them proceed, and that the building of the main structure might go forward without waiting for decisions on those points.

Many an aircraft engineer's heart will warm to Mr. Sheahan. He has done what so few have done—tabulated the causes of delay and proposed methods by which they could be removed. The British Aircraft Industry and the Air Ministry might consider together the advantages to be gained from a system which would allow the development of aircraft and equipment to proceed side by side, without causing either to wait on the other. This is precisely the sort of efficiency which the urgent needs of war should encourage.

The Latest From The N.A.C.A.

THE NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS claims that it has produced a new wing-section which give laminar flow over practically the whole surface.

Dr. G. W. Lewis, Director of the N.A.C.A., who is to deliver the Wilbur Wright Lecture on May 25 (Thursday of this week), spoke of this new section at a recent N.A.C.A. Reception at Langley Field, and claimed a reduction of drag of about 67% by this discovery, but he did not say at what speed.

The announcement of the new N.A.C.A. wing-section may be connected with the release of information about the new two-motor Consolidated Model-31 flying-boat, which had an extremely thin wing for which extraordinary qualities are claimed,—including an increase in maximum speed of about 20% over aeroplanes of the same size with conventional wing-sections.

Although the rumours are probably, as always, exaggerated there is undoubtedly some real point in Dr. Lewis's remarks. Whether the N.A.C.A. is dabbling with some method of boundary layer suction or whether it has made some fundamental discovery to reduce drag is still unknown.

A new low-drag motor-cowling for high-speed aeroplanes, a retractable hydrofoil to help flying-boats to take off, a high-lift low-drag Venetian-blind flap, and petrol injection devices to replace carburetters, were shown at the Reception. The new wing was not.

Two new compressed-air wind-tunnels were opened by Dr. Edward P. Warner, one in which models with spans up to 19 ft. can be tested at wind-speeds of 250 m.p.h., the other a tunnel in which models can be flown freely, operated by remote controls. In both tunnels the engineers actually work in the compressed air and have to be gradually de-compressed, like divers, before they can leave.

A High-Power Allison

A 2,400 H.P. 24-cylinder four-bank liquid-cooled aero-motor has been developed by the Allison Engineering Co., a Division of the General Motors Corp. It is on view in the General Motors Building at the New York's World's Fair.

The new motor is really a combination of two of the earlier Allison 1,200 h.p. 12-cylinder Vee motors on a common crank-case. The centre-lines of the individual Vees are arranged at about 120 degrees to one another but the cylinders are in the upper half of the sector instead of inverted. The dry weight is said to be less than 1 lb. per h.p.

To Wright a Wrong

WITH COMMENDABLE frankness, all to rare in commerce, the Pratt and Whitney people inform us that the 200 North American BT-9 trainers bought for France will not have Pratt and Whitney motors as we said on March 1.

Mr. Norman V. Clements, Advertising and Publicity Manager, says, " We are naturally pleased to see the mention of our equipment in this item but we believe that you will be interested in knowing that the North American airplanes purchased by the French Government are not to be powered by Pratt and Whitney engines.''

What could be fairer? He is a wise father who knows his own child and obviously our French informant on this point was misinformed. We apologise to all concerned.

Rolls-Royce on Clydeside

SIR KINGSLEY WOOD announced in the House of Commons on May 15 that a vast factory for the building of Rolls-Royce aero-motors is to be put up on the Hillingdon Industrial Estate just South-West of Glasgow in Scotland. It will be managed by Rolls-Royce Ltd. on behalf of the Air Ministry. The factory will cost about £4,000,000 and will give employment to about 10,000 men. Scottish firms will be invited to tender.

Rolls-Royce Ltd. have taken over a site of 106 acres. The actual Works will cover about 50 or 60 acres. The rest will be used for recreation grounds or houses. Production should begin in about 12 months and reach a maximum by the beginning of 1941.

This is the biggest engineering development on Clydeside for the past 30 years, and it will be the largest aero-motor factory in the World.

Lord Provost P. J. Dollan, of Glasgow, has for the past six months tried to get work for Clydeside from the Air Ministry. He argues that the West of Scotland is a reservoir of skilled engineers available for aircraft work, and says that the Rolls-Royce factory will be the industrial chance of a lifetime for the people of Clydeside.

A training centre for workmen is to be set up in Glasgow immediately. Boys in the Secondary Schools at Govan, whence much of the labour will be drawn, are to be taught aircraft engineering so that they can be useful in the Rolls-Royce factory and the Maintenance Depot at Abbotsinch. The Air Ministry has supplied aero-motors for instruction in two of the schools. Instruction will be given also to 1,500 of those who are attending junior schools in the South of Glasgow.

Skilled workers must be brought from the Rolls-Royce Works at Derby for a start. Later on Glasgow hopes to supply the whole demand.

More Complications

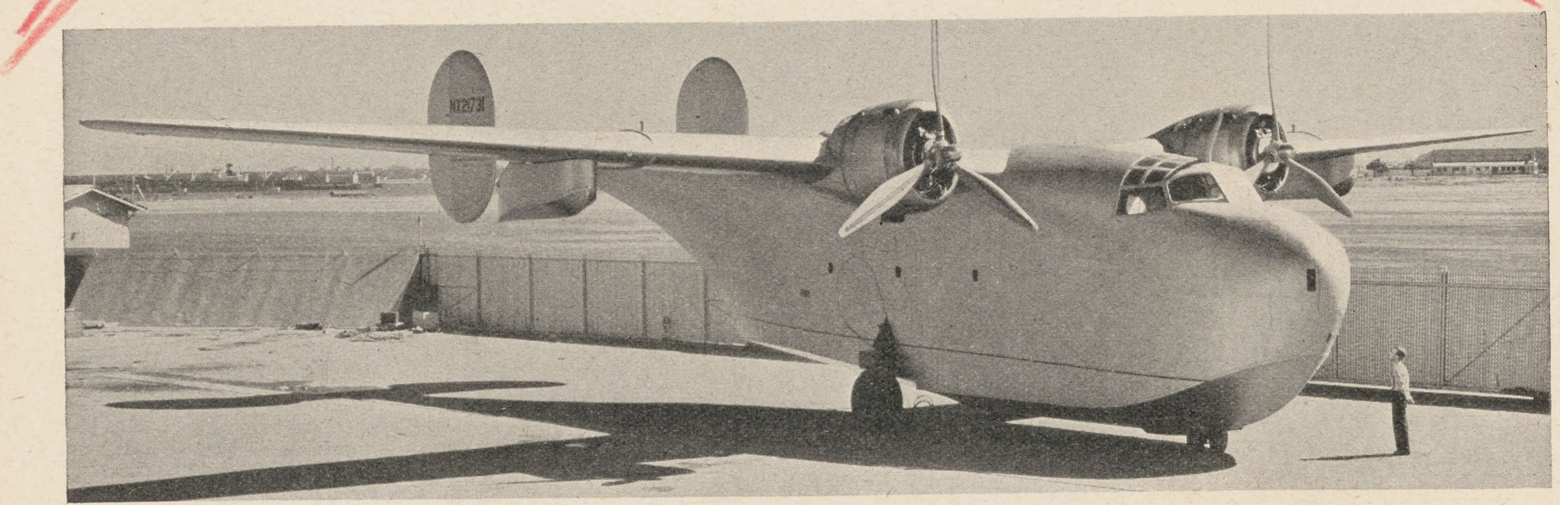
ACCORDING TO A DISPATCH from New York, President Roosevelt before leaving Washington on May 2, told his assembled phalanx of news-hawks that he " Considered a possible air attack in the Caribbean area necessitated an improvement of American defences there.''

As a digger-up of trouble President Roosevelt beats even his predecessor President Wilson. The difference between the two is that whereas President Wilson and his good intentions paved the way for the present Hell in Europe, President Roosevelt seems to be busy digging up the pavement and letting Hell loose.

Just who could attack whom and with what in the Caribbean area will take a bit of working out. Possibly President Roosevelt is thinking of the Mexican Air Force armed with American Grumman airplanes built in Canada bombing the Caribbean end of the Panama Canal. Or perhaps he is afraid that German aeroplanes, operating by collusion with the Netherlands West Indies Colonies from Curaçao may bomb Palm Beach or Miami.

Perhaps President Roosevelt's best and cheapest plan would be to import a section of the Russian Air Force as a Caribbean Air Defence Force.

But seriously, we would really like to know precisely what form of offence President Roosevelt fears in the Caribbean.



AMERICA'S LATEST:—The new Consolidated Flying-Boat Model 31, which has retractable beaching gear, but is not an amphibian. It has two 2,000 h.p. 18 cylinder two-row Wright motors. It weighs 50,000 lb. all up,—which is less than the Short Cabot class. Its alleged speed is more than 300 m.p.h. Rumour says that the wing is the new N.A.C.A. mentioned above.

NOV 6 1939

THE SAN DIEGO SUN

San Diego Sun 11-14-39

One Minute You're Bouncing Along Water, Next You're High Up In Air—That's Taking Off In Archbold's Guba

Sun Aviation Editor Takes Guest Hop

Guest of Russ Rogers, chief pilot of the Consolidated airboat Guba, on one of its first test hops since completion of four months' overhaul in the local plant, was Harold Keen, The Sun's aviation editor, who recounts his experiences below.—The Editor.

By HAROLD KEEN

The most sweeping, completely unhampered view of San Diego is from the snug compartment where the bombing observer sits at the very tip of a Consolidated patrol plane's nose.

Thoughts like that will run through your mind if you ever get a chance to squeeze into the revolving turret-like glass-enclosed cubicle in the snout of a PBY.

Just aft of you, and on a higher level, are the two poker-faced pilots, above them are twin whirling power plants that hurl waves of thunderous sound against your tender ear drums, and still farther back is the majestic, broad expanse of wing, 104 feet from tip to tip.

VIEW UNIMPEDED

But nothing in front or directly below that tiny perch blocks the vision of the occupant whose job it is to sight his target, then touch the levers from which flash electrical impulses release death loads of bombs carried on the under side of the wing.

All 12 tons of the Consolidated PBY is built for the effective use of this space, which occupies perhaps one-twentieth of the entire airboat's area.

The ordinary civilian can barely get within binocular range of a Navy bomber turret, but, once invited, you can come and go as you please in the world's most famous privately owned seaplane, the Guba.

And we did plenty of squirming into and out of the various compartments that make up this useful ship.

PILOT HELD IN ESTEEM

We learned why Russ Rogers, Mr. Archbold's chief pilot, is recognized, even by the Navy, as one of the most skillful airboat operators in the country.

He doesn't tarry on the takeoff. One instant you're bouncing along, like the world's fastest motorboat, with frothy cascades of water splashing against the turret, and the next you're hundreds of feet in the air. That cruiser that looked so formidable a moment ago now is a model floating in a huge bathtub.

A hatch on the floor of the bomber's-observer compartment is pointed out as the location, in a Navy plane, of the bomb-sight set in glass.

With its aid and that of instruments calculating the speed, drift and altitude of the airboat, the flying mathematician determines the exact moment when to drop any or all of the four 1000-pound bombs—or the two torpedoes—a PBY can carry.

MECHANIC GUIDES

Steve Barrinka, the pleasant young mechanic who kept the Guba's engines in good shape on its Netherlands New Guinea expedition, and on its later trip around the world back to San Diego, acts as guide to the "tourists" who fly the craft.

Far back in the ship, near the tail, he shows you a triangular hatch that opens up to the earth below.

"We dropped hundreds of pounds of supplies through this opening to the inland New Guinea camps of the scientists," he explained, sitting precariously at its edge. He answered the unspoken question. "I couldn't fall out of here if I tried. The air pressure would act like a safety net."

Amidships, in the cargo compartment, sitting on a highchair suspended from the ceiling and intently watching a bewildering array of instruments, is a Consolidated employe. "He's the flight engineer on these test hops," Steve commented. "Those instruments tell him whether the cylinder head temperature is safe, whether the carburetor is being supplied with the correct amount of heat, whether the engines are functioning smoothly."

RADIOMAN AT WORK

In another compartment, just behind the pilots, is a broad table covered with charts for the navigator, and on the opposite side of the narrow aisle, Harold Ramm, the radio operator, is dot-dashing Boston.

"Once, when we were in New Guinea, we contacted that Boston station, 10,000 miles away, and a few minutes later, I had a message through to my wife in Maine," Mr. Barrinka recalls. He claims that as the most distant communication ever effected from an airplane.

The Guba crew is quite proud of their ship, an exact replica of the Navy's early PBY's. They can point out the fact it is the only plane ever to operate from water at an 11,000 foot elevation, when the motor has little more than half its power available, due to the thin air. That was on Lake Habbema, in New Guinea. It's also the only ship to have flown around the world the longest way—25,000 miles, which included the first flight across the Indian Ocean, on a survey trip for the Australian government.

FOG HORN REQUIRED

Because the Guba is considered no less a vessel than any other surface craft, it must carry a fog horn, bell, and life preservers. There's a collapsible boat for use in emergencies. And a complete galley, with stove and running water. There are four comfortably upholstered leather chairs and bunk space where you can sleep like a log. After you get used to it, the rasping sound from the 1000-hp engines actually lulls you to sleep, says Mr. Barrinka.

Aside from the landings and takeoffs, the Guba in flight is so smooth that your sensations are similar to those of a bus-rider.

Except when, without warning, from a cloud layer on an overcast day such as this particular one, a Navy PBY suddenly dashes out just off your port side, causing even such a veteran aviator as "Red" Harrigan, Lindbergh Field custodian who also went up for the free ride, to whistle.

CONSOLIDATED SET FOR FOREIGN PLANE JOBS

SECRET ORDERS FOR 250 WAR CRAFT DENIED

Firm Only One Whose Machines Could Fly Atlantic Safely

By HAROLD KEEN
Aviation Editor.

While scoffing at reports that the company had secret orders from both England and France, Consolidated Aircraft Corp. officials today emphasized that their concern is probably the only manufacturer in the United States all of whose products could be delivered over any ocean in the world.

The Consair executives categorically denied that foreign orders were already on the books and had only awaited the arms embargo repeal to signal full speed ahead on actual production.

Announcement in a recent aviation trade journal that the San Diego company had a contract for 250 planes for Great Britain was described as inaccurate.

DELIVERY RECALLED

Significant in connection with any reports of aircraft work for England is the delivery, several months ago, of a PBY-type patrol bomber to the Royal Air Force on a flight across the United States to Botwood, Newfoundland, and across the Atlantic to Britain.

In this manner was dramatically illustrated the possibility of ferrying whole fleets of bombers to distant shores—a valuable feature to be considered by foreign governments buying in the United States. Submarines cannot sink airplanes delivered by air.

CITE GUBA FLIGHT

Flight of the Guba, Richard Archbold's Consolidated seaplane, over every major water body in the world on his globe-girdling jaunt which ended last July, is also used by Consolidated officials as a selling point.

It was learned that inquiries which may lead to orders from foreign governments have been made at the Consolidated plant.

With the European field now left open, the San Diego concern is expected to compete with all other manufacturers in attempting to meet the demand for new planes.

SPUR TO BUSINESS

Just how the regulation requiring cargoes to belligerent nations to be shipped in foreign bottoms would affect the method of trans-oceanic delivery by air is a matter for attorneys to study, Consolidated officials said.

That lifting of the embargo will inevitably spur local airplane business was foreseen here. Solar and Ryan plants supply parts for factories in the Los Angeles area which have millions of dollars worth of contracts to fulfill with England and France.

SERVICE AVIATION

"MONOPLACES DE CHASSE CRACHE FEU" : Spitfire eight-gun fighters of the squadron which in company with formations of Hurricanes, Blenheims, Hampdens and Wellingtons represented Great Britain in the great parade of aerial and terrestrial might staged in Paris last week.

Royal Air Force and Official Announcements :

Higher Appointment

THE Air Ministry announces the appointment of Group Capt. John Walter Cordingley, C.B.E., to assume the duties of Director of Manning, Air Ministry, with effect from July 17.

Group Captain Cordingley, who was born in 1890, joined the Royal Naval Volunteer Reserve in 1905 and in 1918 was appointed to the rank of Major in the Royal Air Force, assuming the duties of Staff Officer, Class 2, in the Directorate of Manning at the Air Ministry.

He was awarded the O.B.E. in 1919, and in the same year was granted a permanent commission in the Royal Air Force with the rank of Squadron Leader. Since 1922 he has been in command of the Record Office, Ruislip, and in the Birthday Honours List of 1937 was promoted to C.B.E.

He was promoted to the rank of Wing Commander in 1924, and to his present rank in 1931.

As Director of Manning he will be responsible to the Air Member for Personnel for planning the man-power requirements of the R.A.F. and for the executive control of recruitment for the R.A.F. and for the Volunteer and Regular Reserves.

R.A.F. Flight Over France

FOLLOWING on the display by Wellingtons and a Hurricane at Evere, on Tuesday, July 11, twelve squadrons of Wellingtons, Hampdens, Blenheims and Battles, numbering in all over 100 aircraft, started off at 08.00 hours from their home stations in the Midlands for a flight over France, which had been arranged by agreement with the French Government.

The long-range craft followed the route Havre, Le Mans, Samur, Bordeaux, Angers, Caen, and so back to England, a non-stop flight of about 1,200 miles. The others followed the route Le Treport, Orleans, Le Mans, and crossed the coast near Cherbourg on their way home, a total of nearly 900 miles. All flew at a height of 2,000 metres (6,500ft.), except when over the larger towns, when they came down to 1,000 metres (3,250ft.) in order to show themselves off to the inhabitants. All the machines returned safely to their home stations. Similar flights are to be made this week.

The arrangement is that French squadrons shall pay a return visit by making a flight over Great Britain—probably it will take place this week.

The Paris Demonstration

ONE squadron each of Spitfires, Hurricanes, Blenheims, Hampdens and Wellingtons joined with Morane 406s, Curtiss P.35s, Potez 63s, Breguet 691s, Bloch 131s and Liore 45s of the French Air Force in a fly-past over Paris preceding the parade in the Champs Elysées last Friday. The fly-past was led by a single-Morane 406, piloted by General d'Harcourt, Inspector-General of the French fighter force. In the first place it was intended that the British fighters should lead, but it was thought that they might experience some difficulty in keeping formation at 175 m.p.h., which was the agreed speed. Instead, the British bombers were in the vanguard, the Spitfires and Hurricanes bringing up the rear and demonstrating their speed by passing the main body as it flew along the Champs Elysées. The squadrons flew at different heights, the lowest being the graceful Potez 63 twin-engined fighter-bombers. In all, 315 aircraft took part, 45 being British. Air Chief Marshal Sir Cyril Newall, Chief of the Air Staff, left for Hendon later in the day in a Percival Q.6.

Fleet Air Arm News : Military Aviation Abroad

Distinguished Flying Medal

HIS MAJESTY THE KING has been graciously pleased to approve the undermentioned reward for gallant and distinguished service in Palestine:—

Distinguished Flying Medal.—Sgt. Harry John Goodchild.

On May 23, 1939, Sgt Goodchild located armed rebels near Kh. Wazil and took vigorous air action against them in extremely difficult flying country. The fighter machine which he was flying was subjected to heavy fire from dense coverage, and, after several hits, the air-pressure system was put out of action. Sgt. Goodchild, after flying back to Ramleh, returned to the area in another machine and continued his previous tactics of holding the rebels until the arrival of the British ground forces. He displayed great gallantry, daring and flying skill.

Sgt. Goodchild has taken a conspicuous part in a number of major engagements and his name has twice been brought to the notice of the General Officer Commanding, British Forces in Palestine and Trans-Jordan for distinguished conduct.

The Consolidated Arrives

WHAT is undoubtedly a very fine flying boat arrived at the Marine Aircraft Experimental Establishment, Felixstowe, last Friday. Just how fine a craft it is will be ascertained during the next few weeks.

The machine was a Consolidated 28-5 long-range military boat which had flown non-stop from Botwood, Newfoundland, to Felixstowe.

She left the manufacturers' plant at San Diego, California, at 4.23 p.m. G.M.T. last Monday week to fly non-stop the 3,000 miles to Botwood, Newfoundland, but made an intermediate landing at Buffalo as, having had a 30 m.p.h. wind all the way, fuel was

Aeroplane

Common Sense in Development

THE belief in this War appears to be that air supremacy will belong to the side which has the greatest number of aeroplanes. In the last war, the emphasis was laid rather on performance and armament than on numbers, though numbers obviously had an important influence. In the present War it would be suicidal to ignore development work, however much the nation may concentrate on raising the output of aeroplanes. Great Britain, on recent showing, can claim to be a little ahead of the enemy with its fighter aeroplanes. Our bombers, likewise, have some advantage in the matter of self-defence, and the best of them are probably equal in performance to the best the enemy can put into the air.

Both nations will be engaged forthwith in seeking to do better. Design and production must march in step if there is not to be a lag in performance. The production of thousands of aeroplanes will be partly wasted if they cannot expect to meet the enemy at least on equal terms in the matters of speed, armament, load and range. Rapid development may mean shortening the War. It might certainly mean avoiding heavy losses of men and materials. The contention of the British Aircraft Industry that much time might be saved in the development of new types if the Air Ministry could give it greater freedom and embarrass it with fewer modifications thus acquires a special significance.

That contention receives support from an unexpected quarter. An article we reproduce this week in the Aeronautical Engineering Section on the construction of the new Consolidated flying-boat prototype, shows that Government Departments in the United States can be responsible for just as much delay on such a job as similar Departments in this country. It shows, too, that some of the consequences can be just as serious. Take one remarkable statement of Mr. B. W. Sheahan, one of the chief engineers of the Consolidated Corporation. "We have never," he writes, "had an aeroplane advance from the experimental to the production stage without having out-of-date armament installations."

He goes farther and declares that development has sometimes been so retarded that an aeroplane was often obsolescent by the time it reached production. His company has lately shown what can be done by constructing the prototype Model 31 and getting it flown within ten months. Something of the sort was achieved last year by the de Havilland Co. in building the Flamingo within a year. The latest case is the more striking because the new boat is nearly twice the loaded weight of the Flamingo. How it was done, Mr. Sheahan tells. His description of the time-saving methods will be of interest to everybody concerned with development.

HIGH BIDDING.—Sir Kingsley Wood's incursion into a billet card party during his visit to the R.A.F. in France. Evidently the hosts dealt him a good hand.

But he has perceptive things to say also about those aspects in the control of development by a Government Department which lead to the greatest delay. One of his points is that non-flying features are responsible for most of the conferences, modifications and obstruction. He holds that the armament and interior features might be represented by dummies or ballast, while conferences about them proceed, and that the building of the main structure might go forward without waiting for decisions on those points.

Many an aircraft engineer's heart will warm to Mr. Sheahan. He has done what so few have done—tabulated the causes of delay and proposed methods by which they could be removed. The British Aircraft Industry and the Air Ministry might consider together the advantages to be gained from a system which would allow the development of aircraft and equipment to proceed side by side, without causing either to wait on the other. This is precisely the sort of efficiency which the urgent needs of war should encourage.

The Latest From The N.A.C.A.

THE NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS claims that it has produced a new wing-section which give laminar flow over practically the whole surface.

Dr. G. W. Lewis, Director of the N.A.C.A., who is to deliver the Wilbur Wright Lecture on May 25 (Thursday of this week), spoke of this new section at a recent N.A.C.A. Reception at Langley Field, and claimed a reduction of drag of about 67% by this discovery, but he did not say at what speed.

The announcement of the new N.A.C.A. wing-section may be connected with the release of information about the new two-motor Consolidated Model-31 flying-boat, which had an extremely thin wing for which extraordinary qualities are claimed,—including an increase in maximum speed of about 20% over aeroplanes of the same size with conventional wing-sections.

Although the rumours are probably, as always, exaggerated there is undoubtedly some real point in Dr. Lewis's remarks. Whether the N.A.C.A. is dabbling with some method of boundary layer suction or whether it has made some fundamental discovery to reduce drag is still unknown.

A new low-drag motor-cowling for high-speed aeroplanes, a retractable hydrofoil to help flying-boats to take off, a high-lift low-drag Venetian-blind flap, and petrol injection devices to replace carburetters, were shown at the Reception. The new wing was not.

Two new compressed-air wind-tunnels were opened by Dr. Edward P. Warner, one in which models with spans up to 19 ft. can be tested at wind-speeds of 250 m.p.h., the other a tunnel in which models can be flown freely, operated by remote controls. In both tunnels the engineers actually work in the compressed air and have to be gradually de-compressed, like divers, before they can leave.

A High-Power Allison

A 2,400 H.P. 24-cylinder four-bank liquid-cooled aero-motor has been developed by the Allison Engineering Co., a Division of the General Motors Corp. It is on view in the General Motors Building at the New York's World's Fair.

The new motor is really a combination of two of the earlier Allison 1,200 h.p. 12-cylinder Vee motors on a common crank-case. The centre-lines of the individual Vees are arranged at about 120 degrees to one another but the cylinders are in the upper half of the sector instead of inverted. The dry weight is said to be less than 1 lb. per h.p.

To Wright a Wrong

WITH COMMENDABLE frankness, all to rare in commerce, the Pratt and Whitney people inform us that the 200 North American BT-9 trainers bought for France will not have Pratt and Whitney motors as we said on March 1.

Mr. Norman V. Clements, Advertising and Publicity Manager, says, " We are naturally pleased to see the mention of our equipment in this item but we believe that you will be interested in knowing that the North American airplanes purchased by the French Government are not to be powered by Pratt and Whitney engines.''

What could be fairer? He is a wise father who knows his own child and obviously our French informant on this point was misinformed. We apologise to all concerned.

Rolls-Royce on Clydeside

SIR KINGSLEY WOOD announced in the House of Commons on May 15 that a vast factory for the building of Rolls-Royce aero-motors is to be put up on the Hillingdon Industrial Estate just South-West of Glasgow in Scotland. It will be managed by Rolls-Royce Ltd. on behalf of the Air Ministry. The factory will cost about £4,000,000 and will give employment to about 10,000 men. Scottish firms will be invited to tender.

Rolls-Royce Ltd. have taken over a site of 106 acres. The actual Works will cover about 50 or 60 acres. The rest will be used for recreation grounds or houses. Production should begin in about 12 months and reach a maximum by the beginning of 1941.

This is the biggest engineering development on Clydeside for the past 30 years, and it will be the largest aero-motor factory in the World.

Lord Provost P. J. Dollan, of Glasgow, has for the past six months tried to get work for Clydeside from the Air Ministry. He argues that the West of Scotland is a reservoir of skilled engineers available for aircraft work, and says that the Rolls-Royce factory will be the industrial chance of a lifetime for the people of Clydeside.

A training centre for workmen is to be set up in Glasgow immediately. Boys in the Secondary Schools at Govan, whence much of the labour will be drawn, are to be taught aircraft engineering so that they can be useful in the Rolls-Royce factory and the Maintenance Depot at Abbotsinch. The Air Ministry has supplied aero-motors for instruction in two of the schools. Instruction will be given also to 1,500 of those who are attending junior schools in the South of Glasgow.

Skilled workers must be brought from the Rolls-Royce Works at Derby for a start. Later on Glasgow hopes to supply the whole demand.

More Complications

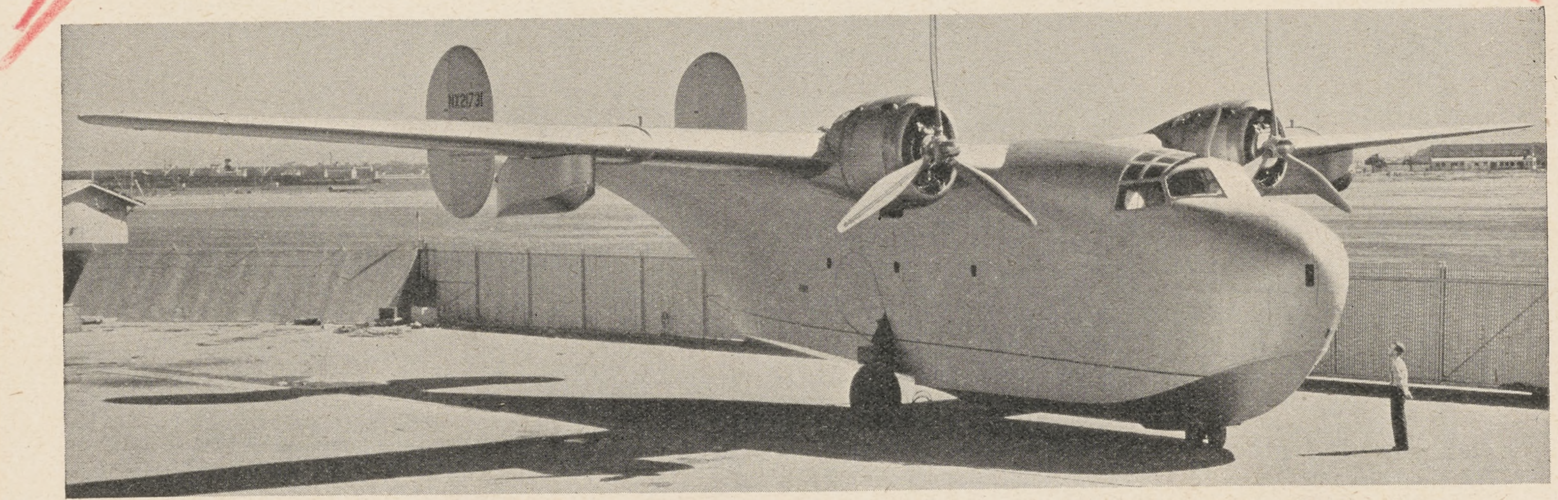
ACCORDING TO A DISPATCH from New York, President Roosevelt before leaving Washington on May 2, told his assembled phalanx of news-hawks that he " Considered a possible air attack in the Caribbean area necessitated an improvement of American defences there.''

As a digger-up of trouble President Roosevelt beats even his predecessor President Wilson. The difference between the two is that whereas President Wilson and his good intentions paved the way for the present Hell in Europe, President Roosevelt seems to be busy digging up the pavement and letting Hell loose.

Just who could attack whom and with what in the Caribbean area will take a bit of working out. Possibly President Roosevelt is thinking of the Mexican Air Force armed with American Grumman airplanes built in Canada bombing the Caribbean end of the Panama Canal. Or perhaps he is afraid that German aeroplanes, operating by collusion with the Netherlands West Indies Colonies from Curaçao may bomb Palm Beach or Miami.

Perhaps President Roosevelt's best and cheapest plan would be to import a section of the Russian Air Force as a Caribbean Air Defence Force.

But seriously, we would really like to know precisely what form of offence President Roosevelt fears in the Caribbean.



AMERICA'S LATEST:—The new Consolidated Flying-Boat Model 31, which has retractable beaching gear, but is not an amphibian. It has two 2,000 h.p. 18 cylinder two-row Wright motors. It weighs 50,000 lb. all up,—which is less than the Short Cabot class. Its alleged speed is more than 300 m.p.h. Rumour says that the wing is the new N.A.C.A. mentioned above.

NOV 6 1939

San Diego Sun 11-14-39

One Minute You're Bouncing Along Water, Next You're High Up In Air—That's Taking Off In Archbold's Guba

Sun Aviation Editor Takes Guest Hop

Guest of Russ Rogers, chief pilot of the Consolidated airboat Guba, on one of its first test hops since completion of four months' overhaul in the local plant, was Harold Keen, The Sun's aviation editor, who recounts his experiences below.—The Editor.

By HAROLD KEEN

The most sweeping, completely unhampered view of San Diego is from the snug compartment where the bombing observer sits at the very tip of a Consolidated patrol plane's nose.

Thoughts like that will run through your mind if you ever get a chance to squeeze into the revolving turret-like glass-enclosed cubicle in the snout of a PBY.

Just aft of you, and on a higher level, are the two poker-faced pilots, above them are twin whirling power plants that hurl waves of thunderous sound against your tender ear drums, and still farther back is the majestic, broad expanse of wing, 104 feet from tip to tip.

VIEW UNIMPEDED

But nothing in front or directly below that tiny perch blocks the vision of the occupant whose job it is to sight his target, then touch the levers from which flash electrical impulses release death loads of bombs carried on the under side of the wing.

All 12 tons of the Consolidated PBY is built for the effective use of this space, which occupies perhaps one-twentieth of the entire airboat's area.

The ordinary civilian can barely get within binocular range of a Navy bomber turret, but, once invited, you can come and go as you please in the world's most famous privately owned seaplane, the Guba.

And we did plenty of squirming into and out of the various compartments that make up this useful ship.

PILOT HELD IN ESTEEM

We learned why Russ Rogers, Mr. Archbold's chief pilot, is recognized, even by the Navy, as one of the most skillful airboat operators in the country.

He doesn't tarry on the takeoff. One instant you're bouncing along, like the world's fastest motorboat, with frothy cascades of water splashing against the turret, and the next you're hundreds of feet in the air. That cruiser that looked so formidable a moment ago now is a model floating in a huge bathtub.

A hatch on the floor of the bomber's-observer compartment is pointed out as the location, in a Navy plane, of the bomb-sight set in glass.

With its aid and that of instruments calculating the speed, drift and altitude of the airboat, the flying mathematician determines the exact moment when to drop any or all of the four 1000-pound bombs—or the two torpedoes—a PBY can carry.

MECHANIC GUIDES

Steve Barrinka, the pleasant young mechanic who kept the Guba's engines in good shape on its Netherlands New Guinea expedition, and on its later trip around the world back to San Diego, acts as guide to the "tourists" who fly the craft.

Far back in the ship, near the tail, he shows you a triangular hatch that opens up to the earth below.

"We dropped hundreds of pounds of supplies through this opening to the inland New Guinea camps of the scientists," he explained, sitting precariously at its edge. He answered the unspoken question. "I couldn't fall out of here if I tried. The air pressure would act like a safety net."

Amidships, in the cargo compartment, sitting on a highchair suspended from the ceiling and intently watching a bewildering array of instruments, is a Consolidated employe. "He's the flight engineer on these test hops," Steve commented. "Those instruments tell him whether the cylinder head temperature is safe, whether the carburetor is being supplied with the correct amount of heat, whether the engines are functioning smoothly."

RADIOMAN AT WORK

In another compartment, just behind the pilots, is a broad table covered with charts for the navigator, and on the opposite side of the narrow aisle, Harold Ramm, the radio operator, is dot-dashing Boston.

"Once, when we were in New Guinea, we contacted that Boston station, 10,000 miles away, and a few minutes later, I had a message through to my wife in Maine," Mr. Barrinka recalls. He claims that as the most distant communication ever effected from an airplane.

The Guba crew is quite proud of their ship, an exact replica of the Navy's early PBY's. They can point out the fact it is the only plane ever to operate from water at an 11,000 foot elevation, when the motor has little more than half its power available, due to the thin air. That was on Lake Habbema, in New Guinea. It's also the only ship to have flown around the world the longest way—25,000 miles, which included the first flight across the Indian Ocean, on a survey trip for the Australian government.

FOG HORN REQUIRED

Because the Guba is considered no less a vessel than any other surface craft, it must carry a fog horn, bell, and life preservers. There's a collapsible boat for use in emergencies. And a complete galley, with stove and running water. There are four comfortably upholstered leather chairs and bunk space where you can sleep like a log. After you get used to it, the rasping sound from the 1000-hp engines actually lulls you to sleep, says Mr. Barrinka.

Aside from the landings and takeoffs, the Guba in flight is so smooth that your sensations are similar to those of a bus-rider.

Except when, without warning, from a cloud layer on an overcast day such as this particular one, a Navy PBY suddenly dashes out just off your port side, causing even such a veteran aviator as "Red" Harrigan, Lindbergh Field custodian who also went up for the free ride, to whistle.

CONSOLIDATED SET FOR FOREIGN PLANE JOBS

OVER

SERVICE AVIATION (CONTINUED)

beginning to run rather low, but Capt. Rogers says that he could have got to Botwood, though without any reserve petrol. Buffalo is the site of the old Consolidated works.

The boat left Botwood at 2.29 B.S.T. last Thursday afternoon and reached Felixstowe, 2,450 miles away, at 6 a.m. on Friday. Capt. Rogers, in command, did not make straight for Felixstowe, as he understood that machines were flying in the vicinity without lights. The average speed across the Atlantic was about 180 m.p.h. as there was a strong following wind.

The crew was the same as that for the sister machine *Guba*, which recently completed a survey flight of the Indian Ocean: Mr. Russell Rogers, pilot; Capt. Lewis A. Yancey, co-pilot and navigator; Mr. Raymond Boothe, radio operator; and Mr. Gerald Brown, engineer.

A photograph of the machine appears on this page.

Sir Kingsley Wood for Belfast

ACCOMPANIED by senior officers of the Royal Air Force, the Secretary of State for Air will visit the Reserve Units of the R.A.F. in Northern Ireland on Friday and Saturday, July 28 and 29. Sir Kingsley will be the guest of the Prime Minister of Northern Ireland and Viscountess Craigavon, and will discuss with Lord Craigavon the question of recruiting for the Reserve and Auxiliary Units of the R.A.F. in Northern Ireland. On arrival at Belfast Harbour Airport on Friday evening, July 28, Sir Kingsley will drive to the Town Centre of the R.A.F. Volunteer Reserve in Donegall Place. The following morning he will make a tour of the Short and Harland works, where Herefords and Bombays are in production. In the afternoon, with Lord Craigavon, he will attend an air display at the airport in which the local Air Force units and the latest types of Service aircraft will take part. A number of flying boats will fly past, and No. 502 (Ulster) Squadron of the Auxiliary Air Force, returning from its annual camp, will make its ceremonial visit to the City of Belfast to which it is affiliated.

Balloon Squadrons : Minimum Age Limit Raised

WITH a view to assisting the recruitment of young men for the field force units of the Territorial Army and the flying units of the Auxiliary Air Force and Royal Air Force Volunteer Reserve, it has been decided that the lower age limit for entry into the balloon squadrons of the Auxiliary Air Force should, with certain exceptions, be raised from 25 years to 30.

Men under the age of 30 years, however, for whom no vacancies exist in the local flying units of the Auxiliary Air Force or the Royal Air Force Volunteer Reserve or the field units of the Territorial Army, or who are not medically fit for service with field force units, will continue to be eligible for appointment to balloon squadrons.

The New Staff College

"IN this setting will be created a seat of learning, the main objects of which are the preservation of peace and, in case of necessity, as I hope all will realise, the defence of our homes and the principles and ideals which have made England what she is, and the fulfilment of our international obligations," said Air Chief Marshal Sir Cyril Newall when he cut the first turf on the site of the new Royal Air Force Staff College at Ramridge House, Weyhill, on July 15.

Sir Cyril emphasised the value to the youngest of the fighting services of the traditions and ancient historic background of Ramridge House, which dated back to Edward the Confessor. A short appreciation of the Manor of Ramridge, he remarked, appeared in the Domesday Book, and it also had associations with Chaucer. He had no doubt that these connections with ancient traditions, history and art, would be of great value to the Air Force, which was still engaged in building its own traditions and making its own history.

"We may mechanise 100 per cent., but the human element will always remain the predominant factor," he added.

He said that many modifications and additions to the old house would be necessary to make it suitable as a Staff College, but every endeavour would be made to avoid impairing its architectural features. Sir James West, designer of the R.A.F. Cadet College, Cranwell, would be responsible for the various modifications and extensions.

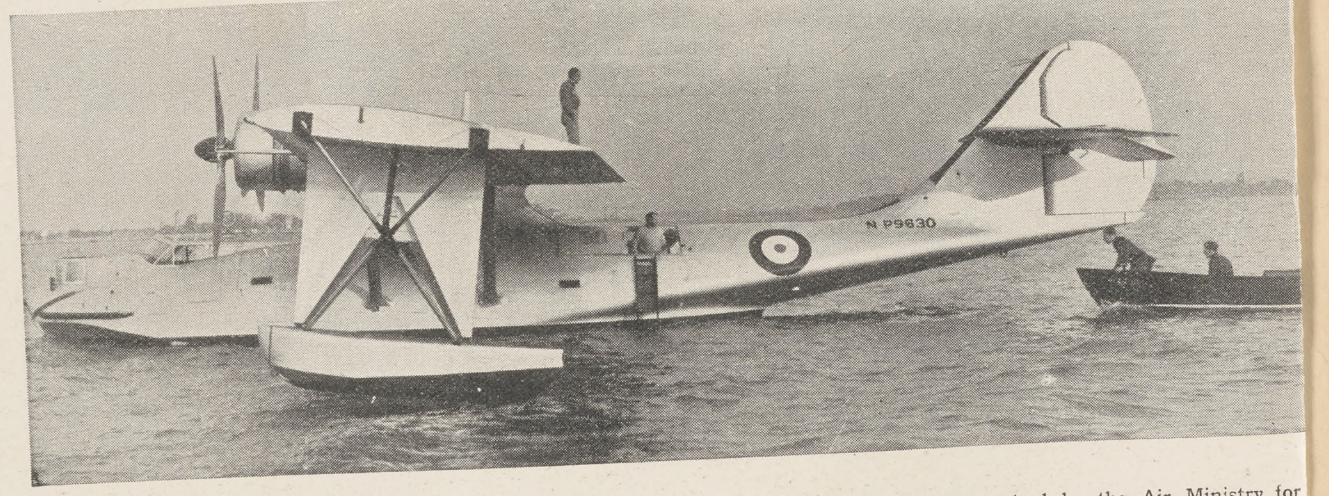
The place where he cut the first turf would be the site of the foundation stone of the new building, to be laid next year.

It was hoped that the new Staff College would be completed by the end of 1941, when it would bear worthy comparison with other public and Service buildings.

Reviewing the history of the present Staff College, Sir Cyril Newall said: "It is over 17 years since the Royal Air Force Staff College was opened in a few war-time huts on Andover aerodrome. I think it is remarkable that throughout that long period it has been possible for instruction to be conducted with such efficiency, bearing in mind the unfavourable conditions under which the college has been working.

"I have heard on numerous occasions from officers of the other Services who have had the privilege of attending our courses at Andover of the great value which they have derived, and that the courses are always regarded as the most instructive and progressive of any of the similar institutions in the country.

"It is not easy to teach or to learn unless conditions and surroundings are favourable to concentration and research, but in this future home at Ramridge Manor both instructors and pupils will be able to work in an atmosphere of quiet and dignified beauty conditions far more appropriate to a seat of learning than hutments with aeroplanes taking off and landing nearby at frequent intervals."



WELCOME STRANGER : The American Consolidated 28-5 flying boat which has been acquired by the Air Ministry for experimental work and which was delivered by air last week. It is said to have a range, with a small military load, of over 4,000 miles. The stabilising floats retract outward and upward to form wing-tips.

Consolidated Air

country. It shows, too, that some of the consequences can be just as serious. Take one remarkable statement of Mr. B. W. Sheahan, one of the chief engineers of the Consolidated Corporation. "We have never," he writes, "had an aeroplane advance from the experimental to the production stage without having out-of-date armament installations."

He goes farther and declares that development has sometimes been so retarded that an aeroplane was often obsolescent by the time it reached production. His company has lately shown what can be done by constructing the prototype Model 31 and getting it flown within ten months. Something of the sort was achieved last year by the de Havilland Co. in building the Flamingo within a year. The latest case is the more striking because the new boat is nearly twice the loaded weight of the Flamingo. How it was done, Mr. Sheahan tells. His description of the time-saving methods will be of interest to everybody concerned with development.

HIGH BIDDING.—Sir Kingsley Wood's incursion into a billet card party during his visit to the R.A.F. in France. Evidently the hosts dealt him a good hand.

But he has perceptive things to say also about those aspects in the control of development by a Government Department which lead to the greatest delay. One of his points is that non-flying features are responsible for most of the conferences, modifications and obstruction. He holds that the armament and interior features might be represented by dummies or ballast, while conferences about them proceed, and that the building of the main structure might go forward without waiting for decisions on those points.

Many an aircraft engineer's heart will warm to Mr. Sheahan. He has done what so few have done—tabulated the causes of delay and proposed methods by which they could be removed. The British Aircraft Industry and the Air Ministry might consider together the advantages to be gained from a system which would allow the development of aircraft and equipment to proceed side by side, without causing either to wait on the other. This is precisely the sort of efficiency which the urgent needs of war should encourage.

The Latest From The N.A.C.A.

THE NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS claims that it has produced a new wing-section which give laminar flow over practically the whole surface.

Dr. G. W. Lewis, Director of the N.A.C.A., who is to deliver the Wilbur Wright Lecture on May 25 (Thursday of this week), spoke of this new section at a recent N.A.C.A. Reception at Langley Field, and claimed a reduction of drag of about 67% by this discovery, but he did not say at what speed.

The announcement of the new N.A.C.A. wing-section may be connected with the release of information about the new two-motor Consolidated Model-31 flying-boat, which had an extremely thin wing for which extraordinary qualities are claimed,—including an increase in maximum speed of about 20% over aeroplanes of the same size with conventional wing-sections.

Although the rumours are probably, as always, exaggerated there is undoubtedly some real point in Dr. Lewis's remarks. Whether the N.A.C.A. is dabbling with some method of boundary layer suction or whether it has made some fundamental discovery to reduce drag is still unknown.

A new low-drag motor-cowling for high-speed aeroplanes, a retractable hydrofoil to help flying-boats to take off, a high-lift low-drag Venetian-blind flap, and petrol injection devices to replace carburetters, were shown at the Reception. The new wing was not.

Two new compressed-air wind-tunnels were opened by Dr. Edward P. Warner, one in which models with spans up to 19 ft. can be tested at wind-speeds of 250 m.p.h., the other a tunnel in which models can be flown freely, operated by remote controls. In both tunnels the engineers actually work in the compressed air and have to be gradually de-compressed, like divers, before they can leave.

A High-Power Allison

A 2,400 H.P. 24-cylinder four-bank liquid-cooled aero-motor has been developed by the Allison Engineering Co., a Division of the General Motors Corp. It is on view in the General Motors Building at the New York's World's Fair.

The new motor is really a combination of two of the earlier Allison 1,200 h.p. 12-cylinder Vee motors on a common crank-case. The centre-lines of the individual Vees are arranged at about 120 degrees to one another but the cylinders are in the upper half of the sector instead of inverted. The dry weight is said to be less than 1 lb. per h.p.

To Wright a Wrong

WITH COMMENDABLE frankness, all to rare in commerce, the Pratt and Whitney people inform us that the 200 North American BT-9 trainers bought for France will not have Pratt and Whitney motors as we said on March 1.

Mr. Norman V. Clements, Advertising and Publicity Manager, says, " We are naturally pleased to see the mention of our equipment in this item but we believe that you will be interested in knowing that the North American airplanes purchased by the French Government are not to be powered by Pratt and Whitney engines."

What could be fairer? He is a wise father who knows his own child and obviously our French informant on this point was misinformed. We apologise to all concerned.

Rolls-Royce on Clydeside

SIR KINGSLEY WOOD announced in the House of Commons on May 15 that a vast factory for the building of Rolls-Royce aero-motors is to be put up on the Hillingdon Industrial Estate just South-West of Glasgow in Scotland. It will be managed by Rolls-Royce Ltd. on behalf of the Air Ministry. The factory will cost about £4,000,000 and will give employment to about 10,000 men. Scottish firms will be invited to tender.

Rolls-Royce Ltd. have taken over a site of 106 acres. The actual Works will cover about 50 or 60 acres. The rest will be used for recreation grounds or houses. Production should begin in about 12 months and reach a maximum by the beginning of 1941.

This is the biggest engineering development on Clydeside for the past 30 years, and it will be the largest aero-motor factory in the World.

Lord Provost P. J. Dollan, of Glasgow, has for the past six months tried to get work for Clydeside from the Air Ministry. He argues that the West of Scotland is a reservoir of skilled engineers available for aircraft work, and says that the Rolls-Royce factory will be the industrial chance of a lifetime for the people of Clydeside.

A training centre for workmen is to be set up in Glasgow immediately. Boys in the Secondary Schools at Govan, whence much of the labour will be drawn, are to be taught aircraft engineering so that they can be useful in the Rolls-Royce factory and the Maintenance Depot at Abbotsinch. The Air Ministry has supplied aero-motors for instruction in two of the schools. Instruction will be given also to 1,500 of those who are attending junior schools in the South of Glasgow.

Skilled workers must be brought from the Rolls-Royce Works at Derby for a start. Later on Glasgow hopes to supply the whole demand.

More Complications

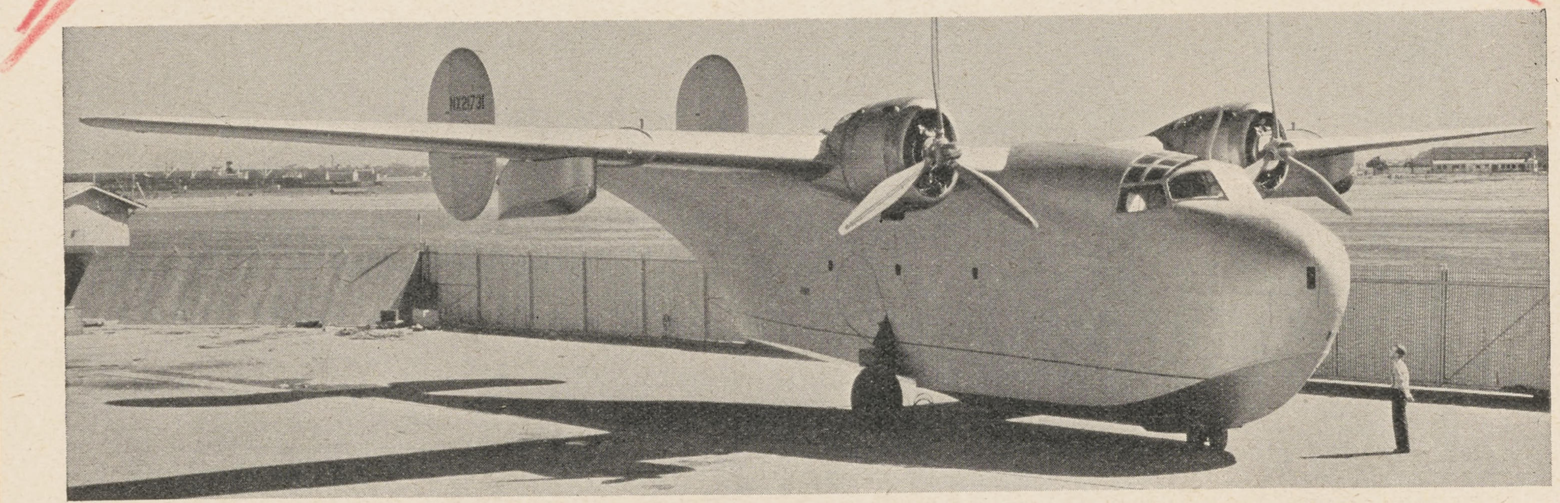
ACCORDING TO A DISPATCH from New York, President Roosevelt before leaving Washington on May 2, told his assembled phalanx of news-hawks that he " Considered a possible air attack in the Caribbean area necessitated an improvement of American defences there."

As a digger-up of trouble President Roosevelt beats even his predecessor President Wilson. The difference between the two is that whereas President Wilson and his good intentions paved the way for the present Hell in Europe, President Roosevelt seems to be busy digging up the pavement and letting Hell loose.

Just who could attack whom and with what in the Caribbean area will take a bit of working out. Possibly President Roosevelt is thinking of the Mexican Air Force armed with American Grumman airplanes built in Canada bombing the Caribbean end of the Panama Canal. Or perhaps he is afraid that German aeroplanes, operating by collusion with the Netherlands West Indies Colonies from Curaçao may bomb Palm Beach or Miami.

Perhaps President Roosevelt's best and cheapest plan would be to import a section of the Russian Air Force as a Caribbean Air Defence Force.

But seriously, we would really like to know precisely what form of offence President Roosevelt fears in the Caribbean.



AMERICA'S LATEST:—The new Consolidated Flying-Boat Model 31, which has retractable beaching gear, but is not an amphibian. It has two 2,000 h.p. 18 cylinder two-row Wright motors. It weighs 50,000 lb. all up,—which is less than the Short Cabot class. Its alleged speed is more than 300 m.p.h. Rumour says that the wing is the new N.A.C.A. mentioned above.

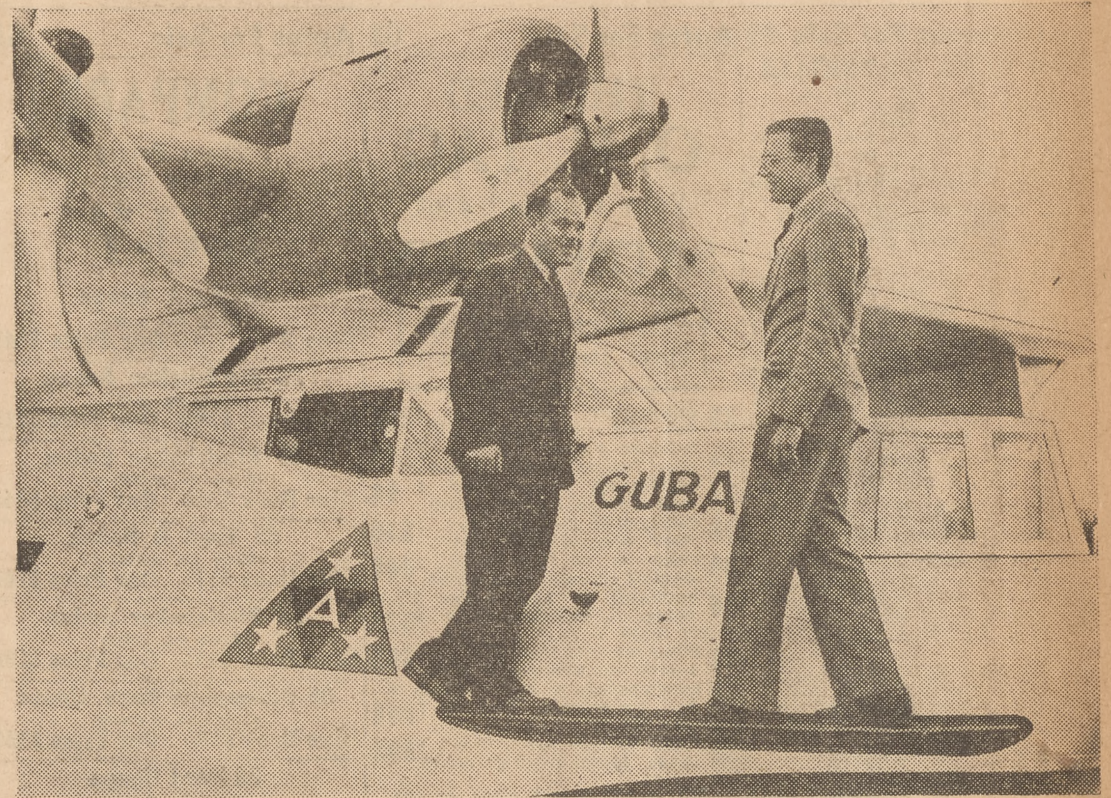
One Minute You're Bouncing Along Water, Next You're High Up In Air—That's Taking Off In Archbold's Guba

Sun Aviation Editor Takes Guest Hop

Guest of Russ Rogers, chief pilot of the Consolidated airboat Guba, on one of its first test hops since completion of four months' overhaul in the local plant, was Harold Keen, The Sun's aviation editor, who recounts his experiences below.—The Editor.

By HAROLD KEEN



REPORTER GETS TAKEN FOR A RIDE . . . HAROLD KEEN, The Sun's aviation editor (right), who flew with CHIEF PILOT RUSS ROGERS in the Guba.

The most sweeping, completely unhampered view of San Diego is from the snug compartment where the bombing observer sits at the very tip of a Consolidated patrol plane's nose.

Thoughts like that will run through your mind if you ever get a chance to squeeze into the revolving turret-like glass-enclosed cubicle in the snout of a PBY.

Just aft of you, and on a higher level, are the two poker-faced pilots, above them are twin whirling power plants that hurl waves of thunderous sound against your tender ear drums, and still farther back is the majestic, broad expanse of wing, 104 feet from tip to tip.

VIEW UNIMPEDED

But nothing in front or directly below that tiny perch blocks the vision of the occupant whose job it is to sight his target, then touch the levers from which flash electrical impulses release death loads of bombs carried on the under side of the wing.

All 12 tons of the Consolidated PBY is built for the effective use of this space, which occupies perhaps one-twentieth of the entire airboat's area.

The ordinary civilian can barely get within binocular range of a Navy bomber turret, but, once invited, you can come and go as you please in the world's most famous privately owned seaplane, the Guba.

And we did plenty of squirming into and out of the various compartments that make up this useful ship.

PILOT HELD IN ESTEEM

We learned why Russ Rogers, Mr. Archbold's chief pilot, is recognized, even by the Navy, as one of the most skillful airboat operators in the country.

He doesn't tarry on the takeoff. One instant you're bouncing along, like the world's fastest motorboat, with frothy cascades of water splashing against the turret, and the next you're hundreds of feet in the air. That cruiser that looked so formidable a moment ago now is a model floating in a huge bathtub.

A hatch on the floor of the bomber's-observer compartment is pointed out as the location, in a Navy plane, of the bomb-sight set in glass.

With its aid and that of instruments calculating the speed, drift and altitude of the airboat, the flying mathematician determines the exact moment when to drop any or all of the four 1000-pound bombs—or the two torpedoes—a PBY can carry.

MECHANIC GUIDES

Steve Barrinka, the pleasant young mechanic who kept the Guba's engines in good shape on its Netherlands New Guinea expedition, and on its later trip around the world back to San Diego, acts as guide to the "tourists" who fly the craft.

Far back in the ship, near the tail, he shows you a triangular hatch that opens up to the earth below.

"We dropped hundreds of pounds of supplies through this opening to the inland New Guinea camps of the scientists," he explained, sitting precariously at its edge. He answered the unspoken question. "I couldn't fall out of here if I tried. The air pressure would act like a safety net."

Amidships, in the cargo compartment, sitting on a highchair suspended from the ceiling and intently watching a bewildering array of instruments, is a Consolidated employe. "He's the flight engineer on these test hops," Steve commented. "Those instruments tell him whether the cylinder head temperature is safe, whether the carburetor is being supplied with the correct amount of heat, whether the engines are functioning smoothly."

RADIOMAN AT WORK

In another compartment, just behind the pilots, is a broad table covered with charts for the navigator, and on the opposite side of the narrow aisle, Harold Ramm, the radio operator, is dot-dashing Boston.

"Once, when we were in New Guinea, we contacted that Boston station, 10,000 miles away, and a few minutes later, I had a message through to my wife in Maine," Mr. Barrinka recalls. He claims that as the most distant communication ever effected from an airplane.

The Guba crew is quite proud of their ship, an exact replica of the Navy's early PBY's. They can point out the fact it is the only plane ever to operate from water at an 11,000 foot elevation, when the motor has little more than half its power available, due to the thin air. That was on Lake Habbema, in New Guinea. It's also the only ship to have flown around the world the longest way—25,000 miles, which included the first flight across the Indian Ocean, on a survey trip for the Australian government.

FOG HORN REQUIRED

Because the Guba is considered no less a vessel than any other surface craft, it must carry a fog horn, bell, and life preservers. There's a collapsible boat for use in emergencies. And a complete galley, with stove and running water. There are four comfortably upholstered leather chairs and bunk space where you can sleep like a log. After you get used to it, the rasping sound from the 1000-hp engines actually lulls you to sleep, says Mr. Barrinka.

Aside from the landings and takeoffs, the Guba in flight is so smooth that your sensations are similar to those of a bus-rider.

Except when, without warning, from a cloud layer on an overcast day such as this particular one, a Navy PBY suddenly dashes out just off your port side, causing even such a veteran aviator as "Red" Harrigan, Lindbergh Field custodian who also went up for the free ride, to whistle.

SAN DIEGO, CALIFORNIA, MONDAY, NOVEMBER 6, 1939

CONSOLIDATED SET FOR FOREIGN PLA

SECRET ORDERS FOR 250 WAR CRAFT DENIED

Firm Only One Whose Machines Could Fly Atlantic Safely

By HAROLD KEEN
Aviation Editor.

While scoffing at reports that the company had secret orders from both England and France, Consolidated Aircraft Corp. officials today emphasized that their concern is probably the only manufacturer in the United States all of whose products could be delivered over any ocean in the world.

The Consair executives categorically denied that foreign orders were already on the books and had only awaited the arms embargo repeal to signal full speed ahead on actual production.

Announcement in a recent aviation trade journal that the San Diego company had a contract for 250 planes for Great Britain was described as inaccurate.

DELIVERY RECALLED

Significant in connection with any reports of aircraft work for England is the delivery, several months ago, of a PBY-type patrol bomber to the Royal Air Force on a flight across the United States to Botwood, Newfoundland, and across the Atlantic to Britain.

In this manner was dramatically illustrated the possibility of ferrying whole fleets of bombers to distant shores—a valuable feature to be considered by foreign governments buying in the United States. Submarines cannot sink airplanes delivered by air.

CITE GUBA FLIGHT

Flight of the Guba, Richard Archbold's Consolidated seaplane, over every major water body in the world on his globe-girdling jaunt which ended last July, is also used by Consolidated officials as a selling point.

It was learned that inquiries which may lead to orders from foreign governments have been made at the Consolidated plant.

With the European field now left open, the San Diego concern is expected to compete with all other manufacturers in attempting to meet the demand for new planes.

SPUR TO BUSINESS

Just how the regulation requiring cargoes to belligerent nations to be shipped in foreign bottoms would affect the method of trans-oceanic delivery by air is a matter for attorneys to study, Consolidated officials said.

That lifting of the embargo will inevitably spur local airplane business was foreseen here. Solar and Ryan plants supply parts for factories in the Los Angeles area which have millions of dollars worth of contracts to fulfill with England and France.

SERVICE AVIATION

"MONOPLACES DE CHASSE CRACHE FEU": Spitfire eight-gun fighters of the squadron which in company with formations of Hurricanes, Blenheims, Hampdens and Wellingtons represented Great Britain in the great parade of aerial and terrestrial might staged in Paris last week.

Royal Air Force and Official Announcements : *Fleet Air Arm News : Military Aviation Abroad*

Higher Appointment

THE Air Ministry announces the appointment of Group Capt. John Walter Cordingley, C.B.E., to assume the duties of Director of Manning, Air Ministry, with effect from July 17.

Group Captain Cordingley, who was born in 1890, joined the Royal Naval Volunteer Reserve in 1905 and in 1918 was appointed to the rank of Major in the Royal Air Force, assuming the duties of Staff Officer, Class 2, in the Directorate of Manning at the Air Ministry.

He was awarded the O.B.E. in 1919, and in the same year was granted a permanent commission in the Royal Air Force with the rank of Squadron Leader. Since 1922 he has been in command of the Record Office, Ruislip, and in the Birthday Honours List of 1937 was promoted to C.B.E.

He was promoted to the rank of Wing Commander in 1924, and to his present rank in 1931.

As Director of Manning he will be responsible to the Air Member for Personnel for planning the man-power requirements of the R.A.F. and for the executive control of recruitment for the R.A.F. and for the Volunteer and Regular Reserves.

R.A.F. Flight Over France

FOLLOWING on the display by Wellingtons and a Hurricane at Evere, on Tuesday, July 11, twelve squadrons of Wellingtons, Hampdens, Blenheims and Battles, numbering in all over 100 aircraft, started off at 08.00 hours from their home stations in the Midlands for a flight over France, which had been arranged by agreement with the French Government.

The long-range craft followed the route Havre, Le Mans, Samur, Bordeaux, Angers, Caen, and so back to England, a non-stop flight of about 1,200 miles. The others followed the route Le Treport, Orleans, Le Mans, and crossed the coast near Cherbourg on their way home, a total of nearly 900 miles. All flew at a height of 2,000 metres (6,500ft.), except when over the larger towns, when they came down to 1,000 metres (3,250ft.) in order to show themselves off to the inhabitants. All the machines returned safely to their home stations. Similar flights are to be made this week.

The arrangement is that French squadrons shall pay a return visit by making a flight over Great Britain—probably it will take place this week.

The Paris Demonstration

ONE squadron each of Spitfires, Hurricanes, Blenheims, Hampdens and Wellingtons joined with Morane 406s, Curtiss P.35s, Potez 63s, Breguet 691s, Bloch 131s and Liore 45s of the French Air Force in a fly-past over Paris preceding the parade in the Champs Elysées last Friday. The fly-past was led by a single-Morane 406, piloted by General d'Harcourt, Inspector-General of the French fighter force. In the first place it was intended that the British fighters should lead, but it was thought that they might experience some difficulty in keeping formation at 175 m.p.h., which was the agreed speed. Instead, the British bombers were in the vanguard, the Spitfires and Hurricanes bringing up the rear and demonstrating their speed by passing the main body as it flew along the Champs Elysées. The squadrons flew at different heights, the lowest being the graceful Potez 63 twin-engined fighter-bombers. In all, 315 aircraft took part, 45 being British. Air Chief Marshal Sir Cyril Newall, Chief of the Air Staff, left for Hendon later in the day in a Percival Q.6.

Distinguished Flying Medal

HIS MAJESTY THE KING has been graciously pleased to approve the undermentioned reward for gallant and distinguished service in Palestine:—

Distinguished Flying Medal.—Sgt. Harry John Goodchild.

On May 23, 1939, Sgt Goodchild located armed rebels near Kh. Wazil and took vigorous air action against them in extremely difficult flying country. The fighter machine which he was flying was subjected to heavy fire from dense coverage, and, after several hits, the air-pressure system was put out of action. Sgt. Goodchild, after flying back to Ramleh, returned to the area in another machine and continued his previous tactics of holding the rebels until the arrival of the British ground forces. He displayed great gallantry, daring and flying skill.

Sgt. Goodchild has taken a conspicuous part in a number of major engagements and his name has twice been brought to the notice of the General Officer Commanding, British Forces in Palestine and Trans-Jordan for distinguished conduct.

The Consolidated Arrives

WHAT is undoubtedly a very fine flying boat arrived at the Marine Aircraft Experimental Establishment, Felixstowe, last Friday. Just how fine a craft it is will be ascertained during the next few weeks.

The machine was a Consolidated 28-5 long-range military boat which had flown non-stop from Botwood, Newfoundland, to Felixstowe.

She left the manufacturers' plant at San Diego, California, at 4.23 p.m. G.M.T. last Monday week to fly non-stop the 3,000 miles to Botwood, Newfoundland, but made an intermediate landing at Buffalo as, having had a 30 m.p.h. wind all the way, fuel was

OVER

Germany and the Netherlands

Stubborn little nat[illegible] in the W[illegible] e enclosing and restricting the Nazis t[illegible] far more [illegible] ie Polish corridor and the stubborn P[illegible] State pr[illegible] the Nazi Reich from inflating its [illegible] and blowin[illegible] its cheeks. All the forces that go out against the British must go out over the widest part of the North Sea. If their objective is anywhere south of Yarmouth, they must move first westwards and then must change course towards the south-west. And the British Navy, aware of this, can lay its plans accordingly. When its scouts report movement, there is still a margin of time in which to array the defences. If the Nazi forces were able to move out of a Netherlands port, the margin would be halved.

Holland is apprehensive and alarmed with good cause. In the last war the Netherlands saw the devastation of Belgium but had no share, except the profitable one of a trading neutral, in other people's quarrels. But on that occasion the main objective of the Germans was France and the Channel ports. This time, the principal enemy is England. Fortified lines have forestalled any plan for a dash to Calais. The nearest way to England is also the easiest way. Holland has no formidable system of defences. Belgium is better prepared. Neither has an air force

EDWIN COLSTO

IATTERS C

The War

ARMAMENTS can now be had from the United States if Great Britain can pay for them and transport them. Supplies can still be obtained from other neutrals if they can be got into the country. Similar goods, commodities, arms and supplies can be kept out of Germany in large measure as long as the Navy remains strong enough and active enough to pursue its scheme of intercepting contraband. The Soviets may protest, but they have no opportunity to do anything about it, except perhaps to use the grievance as excuse for some fresh acquisitive operations of their own. The Nazis, passing beyond fulmination, are doing all they can to oppose it.

Battleships, submarines and aeroplanes are being thrown into this war of supplies. The sinews of war have become more decisive than war itself. Battles are still, as they have always been, a means to an end. The end used to be the domination of an enemy Power by military force. Now the end is approached in two stages. The first seeks to deprive the enemy of the means of war so that the second stage may be swift and inexpensive or unnecessary and superfluous. The battles of to-day are for cargoes and credits rather than for redoubts and railheads.

Feathering the Nest

The non-combatants sit by, while the belligerents struggle for what they need and pay high prices for it. The Soviets get their gains from the Nazis for a bag of gold which looks big but is a fraction of what those gains might have cost in the course of war. Turkey receives a loan from the Allies as the reward of good faith. Italy mops up German trade in the Balkans. The Scandinavian countries pour what they can into the shopping baskets of both sides. The United States, shocked at the vicious misdeeds of a degenerate Europe and scared of their repercussions in a saner continent, agrees after pious consideration to accept Europe's trade and no responsibilities.

The World is open to the war of supplies. All that remains to the belligerents is to destroy or capture them before they can be delivered and to interfere with their manufacture or exploitation at the point of delivery. That in turn must determine the strategy of the War. Nerves have proved stronger than the gangster chief of the Nazis believed. Loyalties, incomprehensible to one who never troubled to honour his bond, have endured far beyond his calculations. Resolution among people, who abhorred the thought of war, has shown itself proof against the temptation of easy if procrastinate relief. Threats come too late to the man who is stripped and ready to meet blows.

Skimming the cream off the Nazi imports may be counted

The Latest From The N.A.C.A.

THE NATIONAL ADVISORY COMMITTEE FOR AERONAUTICS claims that it has produced a new wing-section which give laminar flow over practically the whole surface.

Dr. G. W. Lewis, Director of the N.A.C.A., who is to deliver the Wilbur Wright Lecture on May 25 (Thursday of this week), spoke of this new section at a recent N.A.C.A. Reception at Langley Field, and claimed a reduction of drag of about 67% by this discovery, but he did not say at what speed.

The announcement of the new N.A.C.A. wing-section may be connected with the release of information about the new two-motor Consolidated Model-31 flying-boat, which had an extremely thin wing for which extraordinary qualities are claimed,—including an increase in maximum speed of about 20% over aeroplanes of the same size with conventional wing-sections.

Although the rumours are probably, as always, exaggerated there is undoubtedly some real point in Dr. Lewis's remarks. Whether the N.A.C.A. is dabbling with some method of boundary layer suction or whether it has made some fundamental discovery to reduce drag is still unknown.

A new low-drag motor-cowling for high-speed aeroplanes, a retractable hydrofoil to help flying-boats to take off, a high-lift low-drag Venetian-blind flap, and petrol injection devices to replace carburetters, were shown at the Reception. The new wing was not.

Two new compressed-air wind-tunnels were opened by Dr. Edward P. Warner, one in which models with spans up to 19 ft. can be tested at wind-speeds of 250 m.p.h., the other a tunnel in which models can be flown freely, operated by remote controls. In both tunnels the engineers actually work in the compressed air and have to be gradually de-compressed, like divers, before they can leave.

A High-Power Allison

A 2,400 H.P. 24-cylinder four-bank liquid-cooled aero-motor has been developed by the Allison Engineering Co., a Division of the General Motors Corp. It is on view in the General Motors Building at the New York's World's Fair.

The new motor is really a combination of two of the earlier Allison 1,200 h.p. 12-cylinder Vee motors on a common crank-case. The centre-lines of the individual Vees are arranged at about 120 degrees to one another but the cylinders are in the upper half of the sector instead of inverted. The dry weight is said to be less than 1 lb. per h.p.

To Wright a Wrong

WITH COMMENDABLE frankness, all to rare in commerce, the Pratt and Whitney people inform us that the 200 North American BT-9 trainers bought for France will not have Pratt and Whitney motors as we said on March 1.

RADIOMAN AT WORK

In another compartment, just behind the pilots, is a broad table covered with charts for the navigator, and on the opposite side of the narrow aisle, Harold Ramm, the radio operator, is dot-dashing Boston.

"Once, when we were in New Guinea, we contacted that Boston station, 10,000 miles away, and a few minutes later, I had a message through to my wife in Maine," Mr. Barrinka recalls. He claims that as the most distant communication ever effected from an airplane.

The Guba crew is quite proud of their ship, an exact replica of the Navy's early PBY's. They can point out the fact it is the only plane ever to operate from water at an 11,000 foot elevation, when the motor has little more than half its power available, due to the thin air. That was on Lake Habbema, in New Guinea. It's also the only ship to have flown around the world the longest way—25,000 miles, which included the first flight across the Indian Ocean, on a survey trip for the Australian government.

FOG HORN REQUIRED

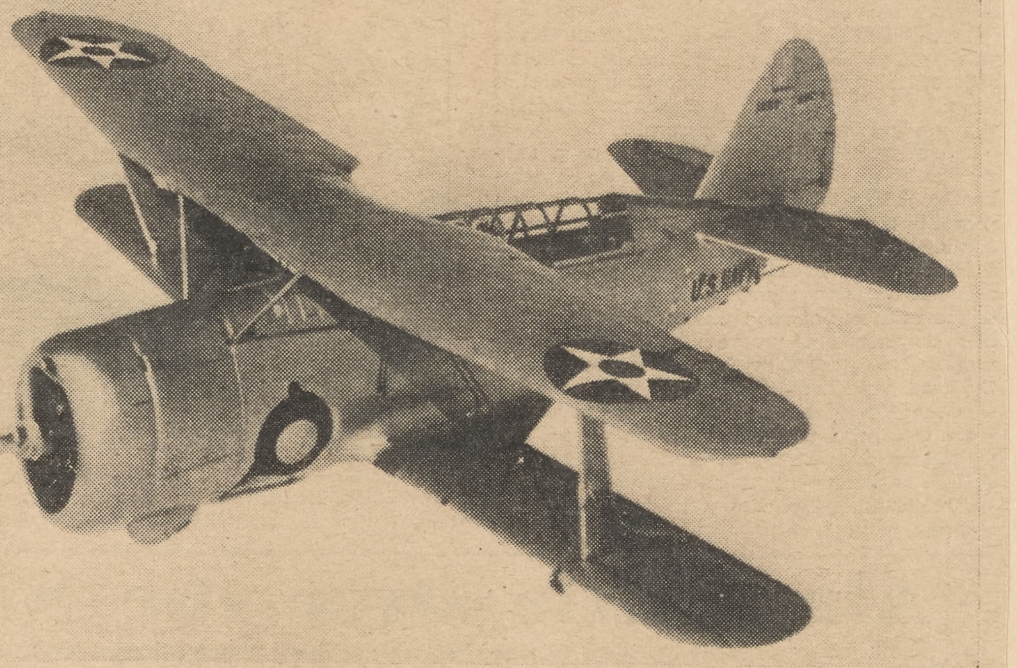
Because the Guba is considered no less a vessel than any other surface craft, it must carry a fog horn, bell, and life preservers. There's a collapsible boat for use in emergencies. And a complete galley, with stove and running water. There are four comfortably upholstered leather chairs and bunk space where you can sleep like a log. After you get used to it, the rasping sound from the 1000-hp engines actually lulls you to sleep, says Mr. Barrinka.

Aside from the landings and takeoffs, the Guba in flight is so smooth that your sensations are similar to those of a bus-rider.

Except when, without warning, from a cloud layer on an overcast day such as this particular one, a Navy PBY suddenly dashes out just off your port side, causing even such a veteran aviator as "Red" Harrigan, Lindbergh Field custodian who also went up for the free ride, to whistle.

Cargo of Bombs

Highly-important—and deeply dreaded—the aerial bomb plays a tremendous part in the formulating of military schemes



This Curtiss SBC-4 dive-bomber biplane has been ordered in large numbers by the U.S. Navy Department as equipment for its aircraft carrier fleet.

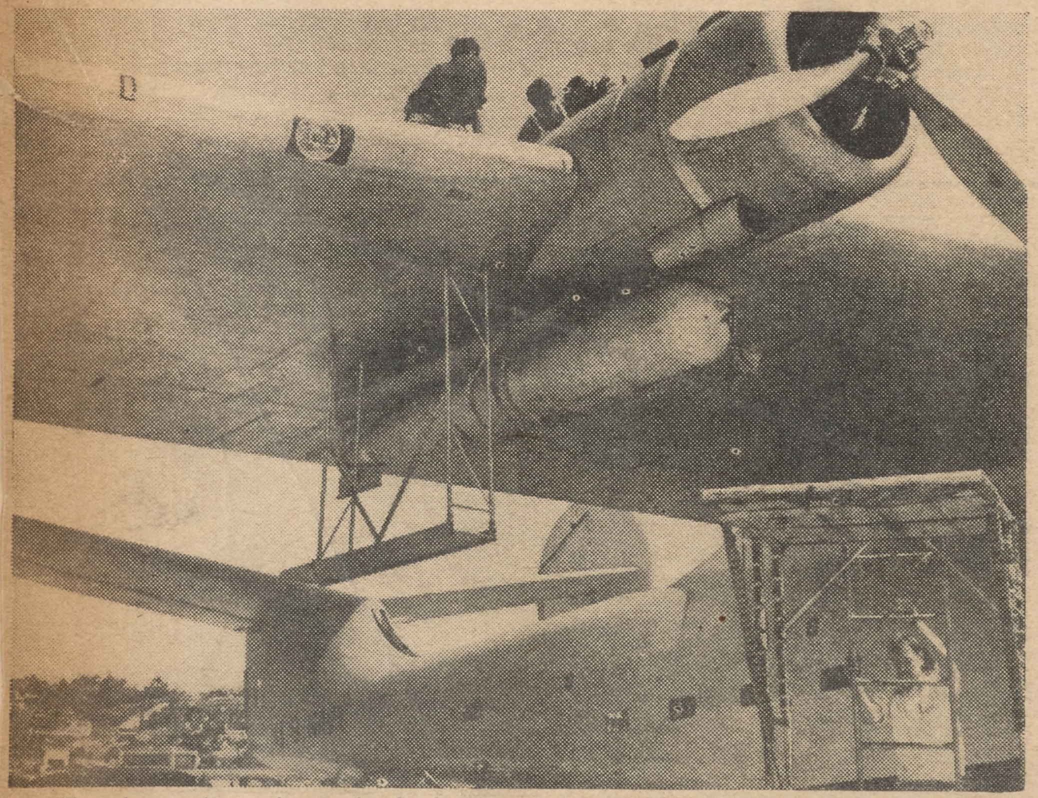
THE most important weapon in the air forces of the combatants in the present war is the bomber. If the bomber is not used, then the fighter has no duty to perform, and these two between them account for 80 per cent. of the aircraft in the air forces of any country.

The bomber must form the striking force. It must take the initiative. It can help to secure a decision. Its very existence has struck fear into the hearts of millions of people. It has been responsible for a complete change-over in our lives, for the A.R.P. organisation, for the darkening of streets.

In Poland the bomber has been used to prevent the concentration of troops, supplies, guns and tanks, so that nowhere were the Poles able to deploy a large army and make a stand, which is why the campaign against 33,000,000 people ended in three weeks.

The strategy of the employment of the bomber has been closely studied by the air staffs of many countries, and by none so much as ours. The Air Staff would like the bomber to be fast enough to outpace the fleetest fighter sent in pursuit, powerful enough to climb at a quicker rate and reach a higher ceiling than the fighter; and at the same time it is desired to give it the maximum range and the heaviest armament for defence, while keeping it big enough to carry the maximum possible payload in the way of bombs.

Obviously all these attributes cannot be built into the same aircraft. So speed has to be sacrified to range and weight-carrying. Generally, modern bombers of the heavy twin- or four-engined type, which would fly long distances at night—when there is greater possibility of concealment from ground defences or from the attentions of fighters—are able to cruise comfortably on two-thirds of their engine power at a good 250 m.p.h. In this respect the performance of British bombers is superior to that of German aircraft.



Two-thousand-pound torpedo slung under starboard wing of a four-engined Consolidated U.S. Navy flying-boat. Another torpedo is carried beneath the port wing; they can be released simultaneously or one at a time.

Then comes the middle-weight bombers, also twin-engined types, but capable of flying at 300 m.p.h. with a lighter bomb load. These aircraft have a range of nearly 2,000 miles, which provides an effective radius of action of 800 miles in any direction. Our bombers in this category have proved able to outdistance even the German single-seater fighters which have sought them on the famous leaflet raids. Then there is the class of single-engined light bomber, not so well protected for defence, but with long range and high speed.

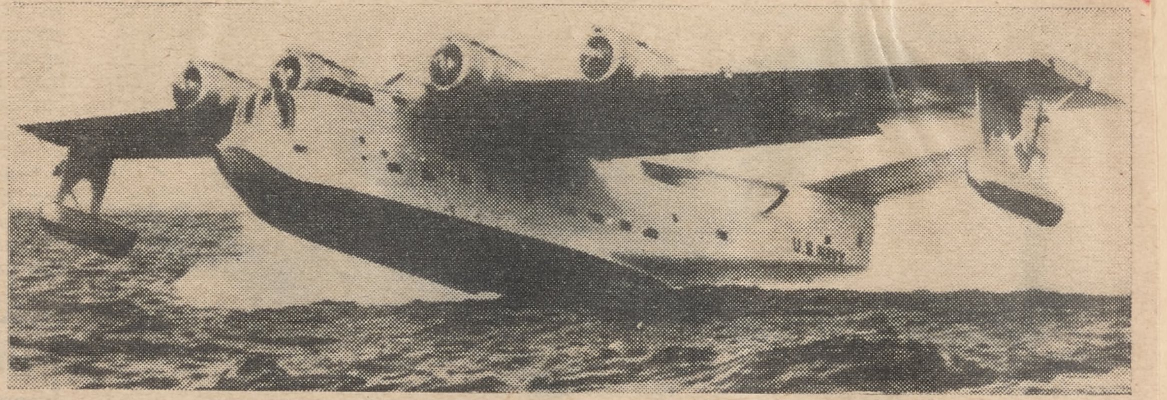
The bomber does not seek battle. Its task is to deliver the goods at the target. Its pilots must be well trained, not only in airmanship, but in cross-country navigation. It must be able to fly for hundreds of miles purely by map and compass and by dead reckoning. Bereft of the use of wireless and relying on imperfect weather reports, it is thrown back to the flying of 20 years ago, when our pioneer fighters of the R.A.F. had no elaborate ground organisation to aid them—such as modern aircraft and pilots are given in peace time.

Although engines are more reliable and instrumentation is better, liability to error in navigation through drift from the course is greater. Speeds are three and four times greater than those of 1914-18. Errors are to this extent magnified. Yet our bombers flying over a darkened Germany have found their objectives, which is magnificent tribute to their flying skill.

Defensive armament for bombers consists largely of machine guns, though both France and Germany have looked with early favour on the cannon gun which fires a small shell. We have concentrated on machine-gun fire. Gunners must be well trained, as upon their ability to shoot straight and protect the vitals of their aircraft depends the safety of a crew which might number six or more.

Training, therefore, is concentrated both on developing accurate aim for bombing and on good marksmanship with the machine-gun. The multi-engined bomber in the big class category has a gunner sitting in a glass-covered nose in front of the pilot. He can swivel his turret—at least in British bombers—and as the engines are in the wing on either side he has a wide field of fire forward in a large arc. Thus he can fire at any aircraft approaching head on or flying at right angles across his course.

NOV 6 1939 OUA



Four-engined U.S. Navy Consolidated patrol-bomber taking off in rough weather outside San Diego Harbour, California. This class of flying-boat has an exceptionally long range.

Amidships there are generally gunners in turrets above and below the fuselage. This gives protection for the fuselage and behind the pilot and navigator at a point which was often a "blind spot" in bombers used 20 years ago. Ingenious devices have been invented for building "dust-bin" pattern turrets which retract into the fuselage when not in use. This lessens obstacles in the air flow and helps the bomber to increase speed.

In the tail, seated far down the aircraft behind the fin and rudder, is another cockpit, glass-covered. Here sits a solitary gunner protecting the tail. Like the gunner in the nose, he has a wide sweep of fire and his cockpit is probably the most important.

Tactics of fighters are, in 80 per cent. of cases, concerned with diving on bombers from a superior height, gathering additional speed for a quick get-away after firing, and by diving on the tail the gunner in this spot will feel the weight of the fighter's armament first. If he is cool and a good marksman, he will hold his fire until the fighter is within about fifty yards, when a good burst from his machine gun should inflict damage and possibly put the fighter out of action.

The fighter may adopt other tactics, such as avoiding the tail to tackle the bomber amidships from above or below with a view to getting at the vitals of the machine and at the pilot. Gunners amidships have a slightly better chance, because there is risk of collision and the fighter must judge the distance well to avoid missing his mark and to avoid collision.

The old practice of getting into position beneath the bomber and of zooming up to fire into its belly has not as much to commend it when there is a gunner firing downwards and when it is not so easy to manœuvre a 350 m.p.h. fighter into this position against a bomber moving at up to 300 m.p.h.

This new Lockheed twin-engined single-seat fighter ordered by the U.S. War Department for the Army Air Corps shows the enormous power now needed by the fighter to give it marked superiority in performance over the bomber. The engines are liquid cooled, of high-output.

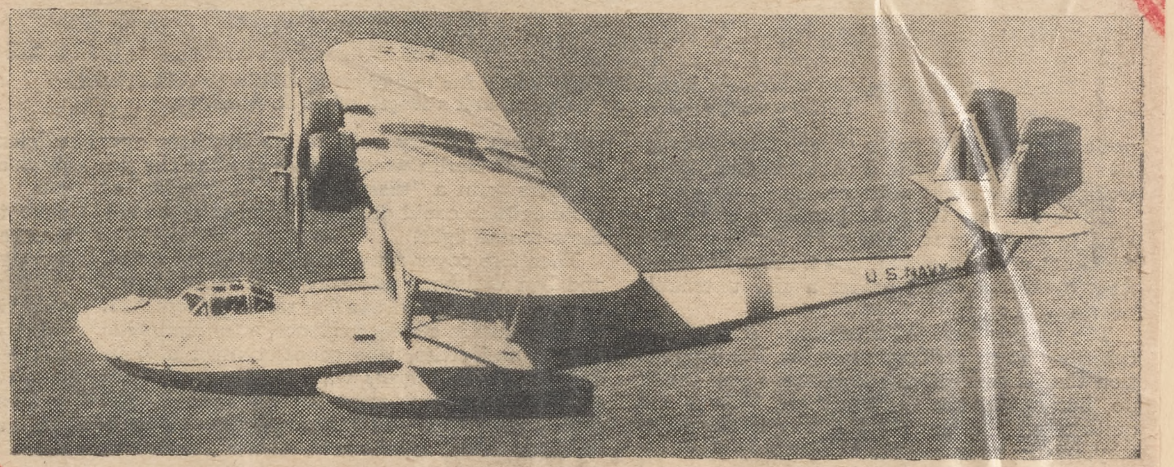
So much for the bomber's defence. Now for its main job of bombing. Bomber crews are taught to bomb to within 50 ft. of accuracy from quite good heights. A circle is laid out on the ground in white paint as the target. Bombing inside this clock face is one method of training. The bomber has many calculations to make—of height, course, speed, wind strength, and wind direction, and distance from the target before he releases his cargo. Generally speaking, the bomb falls following a curve before diving straight down, and it follows the track of the bomber, hitting the ground just beneath it.

Thus a bomb load may be dropped 2 to 20 miles from a target with the object of hitting the target at the moment the bomber arrives over it. The bomb can be seen in its fall as it keeps up with the aircraft. If calculations of wind strength and direction are correct, then accurate aim results. Of course, the lower the height from which bombs are dropped, the less any error tends to grow and the better will be the aim. In the lighter class of bomber, the small bombs will be fitted to wing racks or racks beneath the fuselage. In the medium and larger class, bombs are stowed inside the fuselage and doors open to allow of their dispersal. By this plan there are no excrescencies fitted outside the aircraft to impede speed.

There are two main kinds of bombing tactics: precision bombing and dive bombing. In the former, a formation will fly to its target keeping course as far as possible. They will drop their bombs on the target while flying level and after making all the necessary calculations previously mentioned. This class of bombing is generally indulged in where the target is very big, such as a munitions plant or a railway centre, where 50 ft. of error does not impair the value of the attack, and where ground defences may be too strong to admit of a close approach at low level.

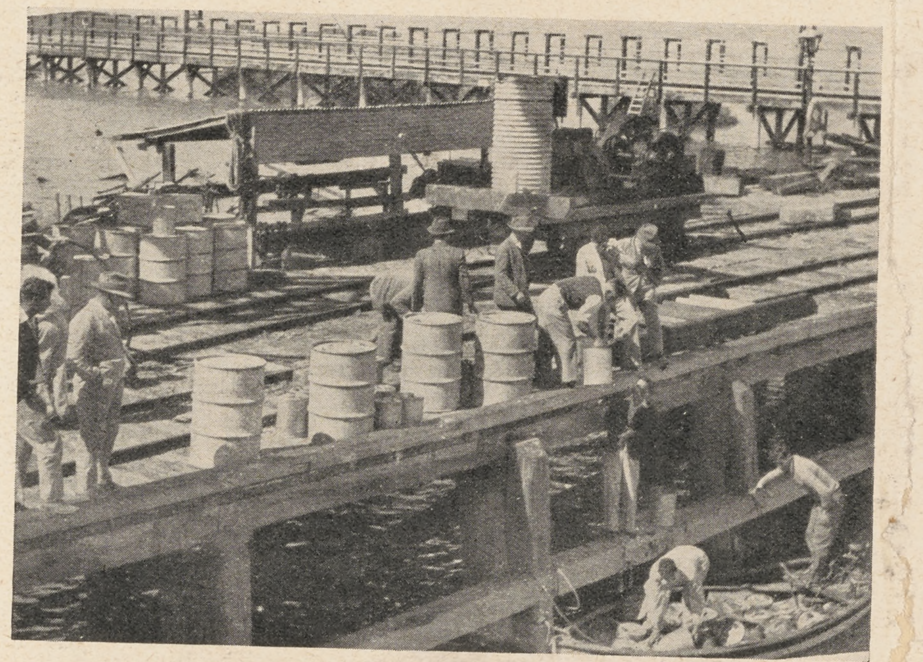
The dive-bombing plan is used when targets are smaller and where greater accuracy must be attained for the bombs to have effect. It is used for attacks on ships, for instance. Dive bombing enables the bomber to increase speed and thus elude pursuers or to outpace fighters. It gives the machine additional power to enable it to zoom away quickly to high altitude after releasing bombs. The bomber may carry only one 500-lb. or 1,000-lb. bomb. One attack on the target by each machine is all that is needed. If there has been accuracy, then every "bullet will find a billet" and the work of destruction should be complete.

Bombers dive singly to this attack, approaching the target from many different angles. This confuses ground defences and prevents A.A. guns from being brought to bear on more than one aircraft in one direction at a time. Low bombing around vital targets or around cities



Twin-engined bomber patrol flying-boat of the United States Navy.

The Completion of the Survey of the Imperial Reserve Air Route to Australia.



AT THE START.—Loading petrol drums at Port Hedland for the "Guba."

CAPTAIN P. G. TAYLOR and his crew in the flying-boat *Guba* alighted at Mombasa, in Kenya Colony, on June 21, and thus completed the air survey of the Imperial Reserve Route to Australia. They had reached the Seychelles Islands on June 18 from Diego Garcia in the Chagos Archipelago, where they had arrived on June 14.—They left Port Hedland in West Australia, which is about half way between Onslow and Broome, on June 4.

The Times correspondent at Sydney stated on June 20 that Captain Taylor had reported to the Commonwealth Government that he had completed his investigation of possible landing grounds and flying-boat bases in the Seychelles and proposed to leave for Mombasa early on June 21.

As there is already a regular Imperial flying-boat base at Mombasa the actual survey of the possibilities of the three island bases on the Reserve Route had then been finished.

Reports hitherto available in this country have been meagre, because evidently none of our great Imperialist English daily newspapers has understood the importance of the Reserve Route. Consequently none of them bought the story from Captain Taylor, and his reports have gone to the Australian newspapers,—and we should not be surprised to learn that they have been bought also by some enterprising American papers.

We shall have to wait for condensations of the reports which have appeared in the Australian papers before we can say much about what Captain Taylor and his crew did or did not see. And we shall have to wait for Captain Taylor's book on the subject before we learn of all the fun and all the adventures of what has been in fact one of the most important flights in the history of aviation.

In the meantime we have had the good fortune to receive by air-mail from Perth a peculiarly vivid description, and some quite amusing photographs, of the start of the flight from Port Hedland. Also we are able to give some interesting information about those sportsmen in Perth, West Australia, who first conceived the idea of an air route across the Indian Ocean, as a reserve airway in case of war.

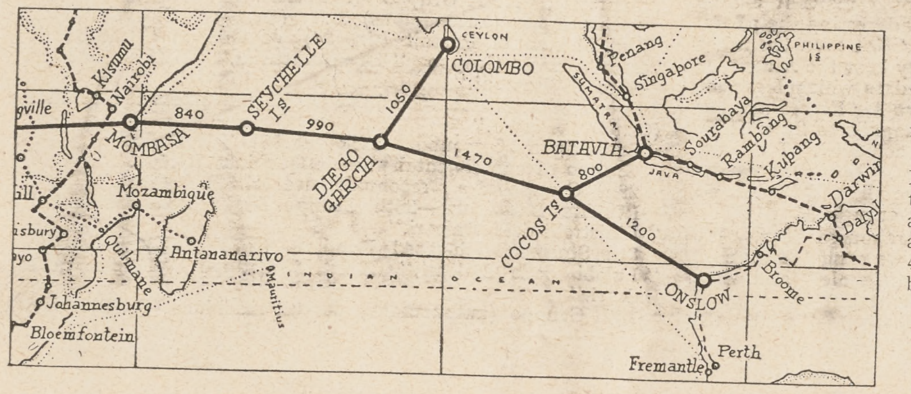
About the Stage-Stops

Little is known of the three outposts of Empire which are the stage-stops, or the facultative arrests, as the French call them, on the Reserve Route,—Cocos Island, Diego Garcia, the Seychelles Islands. Some information about them is likely to be valuable when the route comes to be developed.

THE COCOS-KEELING Islands, 800 miles S.W. of Batavia, and 1,200 miles from the Australian Coast (Port Hedland and Onslow are roughly the same distance away) were adopted by England in 1857 and were placed under the Governor of the Straits Settlements in 1886. They were incorporated with Singapore in 1903. The largest of the 20 islands is 5 miles long by ¼ mile wide. In 1902 a Cape—Australia cable station was set up on Direction Island. There are about 1,200 inhabitants, who grow coconuts and export copra and oil.

DIEGO GARCIA Island, which has a population of about 450, is one of the Chagos Archipelago, which is on the sea route from the Red Sea to Australia. It has a good harbour. The group of islands,—population 1,450,—is administered by the Governor of Mauritius, who sends two magistrates to the islands at intervals to settle disputes. Coconut oil provides about the only industry.

THE SEYCHELLES ISLANDS, the chief of which is Mahé, where the expedition stopped, were captured by an English ship from the French in 1794. They became a British Colony by letters patent in 1903. The population of the 92 islands is about 30,000. Mahé has an area of 56 square miles, and Victoria, the capital, has a good harbour. Copra, oil and guano provide the chief industries. (Our thanks to *Whitaker's Almanack*.)



Seeing the Start

An Australian correspondent who was at Port Hedland for the start writes:—

I have just returned to Perth again after pushing the *Guba* off from Port Hedland (1,028 miles N. of Perth) on what I thought was to be a non-stop flight to Cocos Island, but which has proved to be non-stop to Batavia *via* Cocos. My observations may be of interest to you.

The *Guba* left Sydney to follow a direct course to Port Hedland at 15.45 EST June 3, and expected to arrive 18 hours later. However, they met head winds almost at once and changed course Northward so frequently in their efforts to find the S.E. Trades that their air-line distance was 2,570 miles and their time nearly 20 hours.

Throughout the flight the *Guba's* radio was occupied mainly through dishing out volumes of press messages from the official reporter aboard. The aeradio stations at Cloncurry, Charleville, Alice Springs, Oodnadatta and Port Hedland, which kept constant watches at the request of the Civil Aviation Dept., occasionally attempted to call for positions but were ignored.

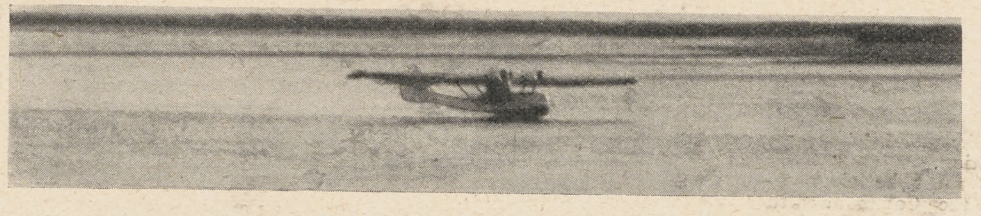
Captain P. G. Taylor said on reaching Port Hedland that this was not intentional ignorance but that they had arranged to work Sydney. The result was that Port Hedland was not acquainted of an E.T.A. (estimated time of arrival) until the *Guba's* engines were booming overhead and the residents came scurrying out of their houses to watch the alighting.

At that time of day,—about 09.30,—the tide was flowing nearly to its maximum and there was miles of sea-room in the sheltered water. The *Guba* wasted no time in getting in and moored some 500 yds. S.E. of the jetty at the buoys laid down for 204 Sqdn. R.A.F. just a year ago, and recently renovated for the *Guba*.

Jaws must have dropped a good deal when the fuel agent went aboard and told the personnel that there was about 1,500 gallons of 87 octane fuel on the jetty waiting to be carried out in 4-gallon drums in dinghies by elderly outboard motors. If they liked, of course, they could tie the *Guba* up to the wharf and take it aboard from the aerodrome's mobile fuelling unit.

The strong rip-tide and the prevailing Easterly across it prevented the alternative suggestion being put into practice and Messrs. Archbold, Taylor, Yancey and Booth came ashore to look into the 4-gallon business and do their shore business, which seemed mainly directed

OVER.



THE EMOTIONING TAKE-OFF.—The "Guba" getting off from Port Hedland. Note that the wing floats, which form the wing-tips when retracted, are already up, although the boat is not properly on its step.

towards getting breakfast and as much sleep as possible.

Chief Pilot R. Rogers and the two flight engineers stayed aboard until something was decided. Apparently the intention was to fill up and push off again that afternoon. Fuelling with 4-gallon drums seemed likely to upset departure time.

After 20 hours in the air, and no sleep for most of the crew, quite a few were anxious to spend a night at Port Hedland, and the consequent clashes of thought with those who had either got some sleep or didn't need it and didn't care for the look of shore accommodation probably led to confusion over the time of setting off.

Yancey and Booth went to bed at once, stopping only for food and liquid with which to restore some warmth. Taylor and Percival, the reporter, went into a huddle to write more reports. Rogers and the engineers stayed aboard to fuel. And the owner went from pub to jetty or from jetty to boat, carrying sandwiches or heaving 4-gallon drums, full or empty, from dinghy to boat or from dinghy to jetty respectively.

As the tide soon turned and dropped ten or twelve feet the work of handling drums from jetty to dinghy or *vice versa* became more and more arduous. From dinghy to boat the work was arduous all the time, and was done on the chain system.

Russell Rogers stood in the hatch opening, took the full drum from the dinghy hand who bobbed about in the tide-rip, heaved it above his head to an engineer who passed it in turn to two others standing at intervals on the wing. The other flight engineer stacked the drums along the metal leading-edge of the wing, which gradually took on the appearance of a window ledge with window boxes but no flowers. Can you imagine yourself touching your toes with hands filled with a 30-lb. 4-gallon drum, and then heaving the drum up over your head—not once but over 300 times with brief halts every 20 drums or so?—Try it before breakfast. That is what Rogers did and he had been awake all night and had had no breakfast.

At each respite between dinghies—and sometimes both were in together making a 40-drum lift—Rogers would hurl himself on a bunk muttering and cursing. But 1,245 gallons were stowed in the tanks within six hours, and then Rogers went ashore for a break and to see what was doing.

While fuelling was going on nobody seemed to care, or were too tired to bother, about visitors. Like a few others I braved the 500-yd. journey in a dinghy which, with gunwales almost under, putt-putted spasmodically out from the jetty.

Inside the "Guba"

I crawled inside. After chatting with an engineer about two Pratt and Whitney engine experts who regularly visit all Australian States on service work and whom we found to be mutual friends, I was invited to "step around" for myself.

What a glorious playground of gadgetry! The Vickers Wellesleys which were specially fitted with instruments for the long-distance record—about 75 all told—were comparatively unfurnished. It must be remembered that the boat was built for long-distance work and not as a passenger airliner. There were, therefore, few home comforts and being unlined I have no doubt that the interior in high flight was as cold as an ice-chest.

I liked very much the divorcing of engine instruments from pilotage instruments. The pilot besides his dual control throttles had only duplicate Sperry panels, a compass and one or two other instruments. That baffling array of dials and knobs to be found in most modern aircraft was set out for the eye of the flight engineer only.

In the *Guba* he sat perched on a chair suspended above the navigator's room half way up the centre-section turret. A small porthole on either side gives him visual observation of his engines. The navigator of the *Guba* has also many gadgets with which to play and these include a librascope.

Having "stepped around" and seen all I wished, and then some, I duly returned to the jetty where people were getting together for the take-off. In a town where there is no newspaper, rumour very speedily arrives at the correct supposition and it was not long before the Hedlandites knew that the *Guba* was to leave about 5 p.m. (Perth Time). Sure enough the owner, the organiser and the others walked out from the town and presently went aboard the boat.

The take-off was an alarming business to the dozen or so Air Force and Air Transport pilots who gathered to watch. No doubt Rogers knew almost to a yard the distance he needed. But those on the jetty didn't. The tide was slack and well out. The shipping channel was at its narrowest,—about 300 yds. and slightly out of wind.

Take-off for PBY-2s is said to be about 38 secs. When 30 of them had run, and over half the runway gone, the *Guba* was still heavy in the water. What appeared to be a "stalled" take-off at the very instant when the hull seemed in danger of running into the coral shallows may not have been so alarming as it actually looked. A dozen watching pilots heaved a synchronised sigh of relief as the *Guba* cleared the flat island at the limit of the run and got away.

All the crew were bound to secrecy about the flight and no interviews were to be given. The result was that most of those concerned had to think twice about admitting it was nice weather or good morning. Why such secrecy was necessary, considering that every newspaper in the Commonwealth was taking the official story from Canberra was not very obvious. Local press representatives were informed of this ban on personnel and Capt. Taylor and Mr. Percival retired to the privacy of their hotel bedroom to dictate their story.

There is a story about this particular hotel which cannot be told here,—but blissfully ignorant of the acoustic properties of the place Captain Taylor dictated his story, and the pub loafers and staff listened with interest to every word of it!

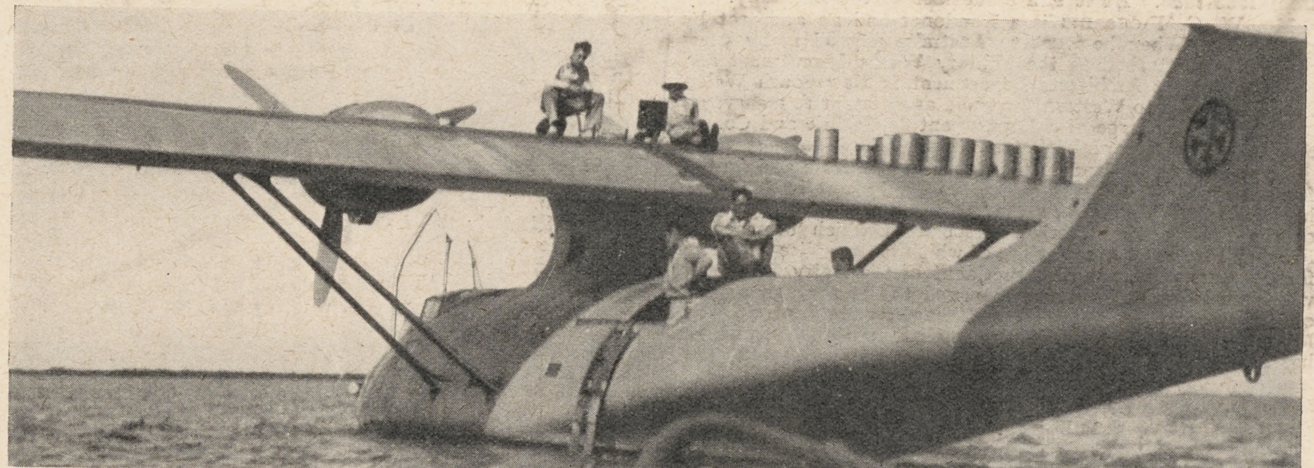
The Pioneers of the Reserve Route

SOME DAY when our Imperial Reserve Air Route to Australia has either proved its value in War or has become a regular express air line somebody will want to know how the idea started. Captain P. G. Taylor, otherwise known as Bill Taylor, will naturally go down to history as the originator of the route and as the man whose drive and energy eventually squeezed a meagre grant out of the Australian Government and got hold of a sporting American millionaire and his flying-boat with which to make this survey which ought to have been done not less than two years ago by Imperial Airways Ltd., with the help of the British and Australian Governments. Failing that it ought to have been done a very little later by the Royal Air Force itself with the help of the British Navy.

That is all true, but historians must not forget the work which was done by a little Committee of Aeronautical enthusiasts and good sportsmen in the City of Perth, Western

PTO

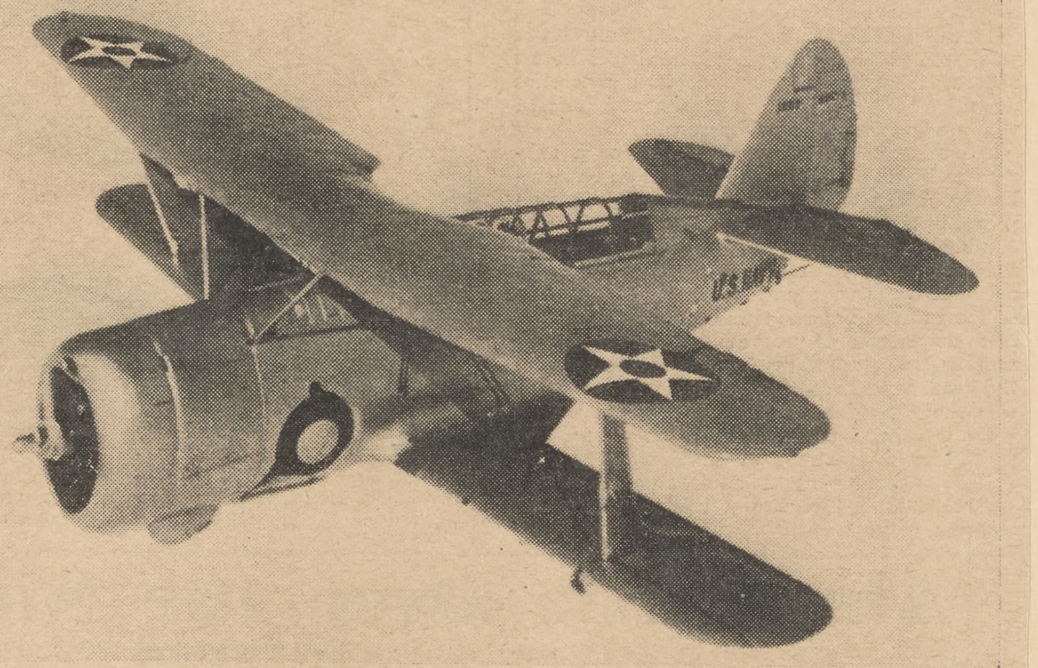
OVER



A LABOUR FOR HERCULES.—Some idea of the physique of Mr. Russell Rogers may be got by imagining the horse-power expended in heaving 311 of those 4-gallon drums seen above from a dinghy alongside to the man on the top of the wing while standing in the door just above water level.

Cargo of Bombs

Highly-important—and deeply dreaded—the aerial bomb plays a tremendous part in the formulating of military schemes



This Curtiss SBC-4 dive-bomber biplane has been ordered in large numbers by the U.S. Navy Department as equipment for its aircraft carrier fleet.

THE most important weapon in the air forces of the combatants in the present war is the bomber. If the bomber is not used, then the fighter has no duty to perform, and these two between them account for 80 per cent. of the aircraft in the air forces of any country.

The bomber must form the striking force. It must take the initiative. It can help to secure a decision. Its very existence has struck fear into the hearts of millions of people. It has been responsible for a complete change-over in our lives, for the A.R.P. organisation, for the darkening of streets.

In Poland the bomber has been used to prevent the concentration of troops, supplies, guns and tanks, so that nowhere were the Poles able to deploy a large army and make a stand, which is why the campaign against 33,000,000 people ended in three weeks.

The strategy of the employment of the bomber has been closely studied by the air staffs of many countries, and by none so much as ours. The Air Staff would like the bomber to be fast enough to outpace the fleetest fighter sent in pursuit, powerful enough to climb at a quicker rate and reach a higher ceiling than the fighter; and at the same time it is desired to give it the maximum range and the heaviest armament for defence, while keeping it big enough to carry the maximum possible payload in the way of bombs.

Obviously all these attributes cannot be built into the same aircraft. So speed has to be sacrified to range and weight-carrying. Generally, modern bombers of the heavy twin- or four-engined type, which would fly long distances at night—when there is greater possibility of concealment from ground defences or from the attentions of fighters—are able to cruise comfortably on two-thirds of their engine power at a good 250 m.p.h. In this respect the performance of British bombers is superior to that of German aircraft.

Then comes the middle-weight bombers, also twin-engined types, but capable of flying at 300 m.p.h. with a lighter bomb load. These aircraft have a range of nearly 2,000 miles, which provides an effective radius of action of 800 miles in any direction. Our bombers in this category have proved able to outdistance even the German single-seater fighters which have sought them on the famous leaflet raids. Then there is the class of single-engined light bomber, not so well protected for defence, but with long range and high speed.

The bomber does not seek battle. Its task is to deliver the goods at the target. Its pilots must be well trained, not only in airmanship, but in cross-country navigation. It must be able to fly for hundreds of miles purely by map and compass and by dead reckoning. Bereft of the use of wireless and relying on imperfect weather reports, it is thrown back to the flying of 20 years ago, when our pioneer fighters of the R.A.F. had no elaborate ground organisation to aid them—such as modern aircraft and pilots are given in peace time.

Although engines are more reliable and instrumentation is better, liability to error in navigation through drift from the course is greater. Speeds are three and four times greater than those of 1914-18. Errors are to this extent magnified. Yet our bombers flying over a darkened Germany have found their objectives, which is magnificent tribute to their flying skill.

Defensive armament for bombers consists largely of machine guns, though both France and Germany have looked with early favour on the cannon gun which fires a small shell. We have concentrated on machine-gun fire. Gunners must be well trained, as upon their ability to shoot straight and protect the vitals of their aircraft depends the safety of a crew which might number six or more.

Training, therefore, is concentrated both on developing accurate aim for bombing and on good marksmanship with the machine-gun. The multi-engined bomber in the big class category has a gunner sitting in a glass-covered

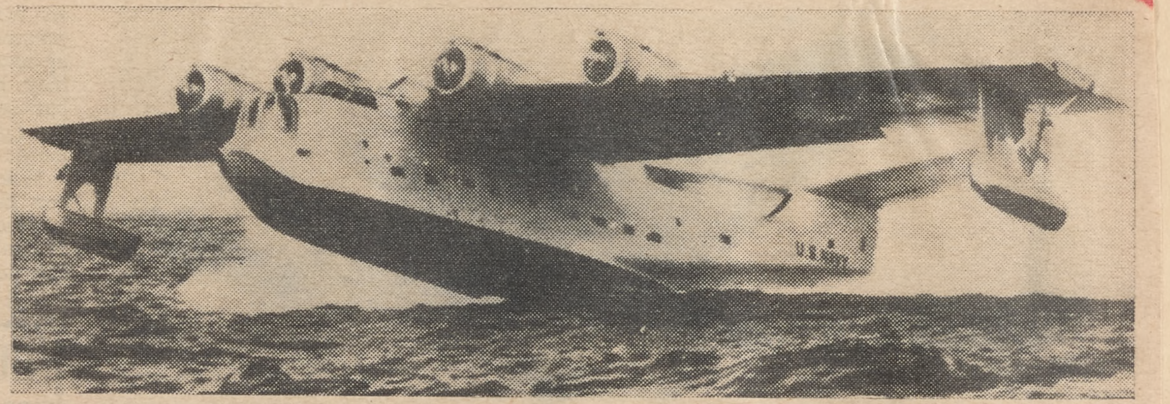
nose in front of the pilot. He can swivel his turret—at least in British bombers—and as the engines are in the wing on either side he has a wide field of fire forward in a large arc. Thus he can fire at any aircraft approaching head on or flying at right angles across his course.

Amidships there are generally gunners in turrets above and below the fuselage. This gives protection for the fuselage and behind the pilot and navigator at a point which was often a "blind spot" in bombers used 20 years ago. Ingenious devices have been invented for building "dust-bin" pattern turrets which retract into the fuselage when not in use. This lessens obstacles in the air flow and helps the bomber to increase speed.



Four-engined U.S. Navy Consolidated patrol-bomber taking off in rough weather outside San Diego Harbour, California. This class of flying-boat has an exceptionally long range.

In the tail, seated far down the aircraft behind the fin and rudder, is another cockpit, glass-covered. Here sits a solitary gunner protecting the tail. Like the gunner in the nose, he has a wide sweep of fire and his cockpit is probably the most important.

Tactics of fighters are, in 80 per cent. of cases, concerned with diving on bombers from a superior height, gathering additional speed for a quick get-away after firing, and by diving on the tail the gunner in this spot will feel the weight of the fighter's armament first. If he is cool and a good marksman, he will hold his fire until the fighter is within about fifty yards, when a good burst from his machine gun should inflict damage and possibly put the fighter out of action.

The fighter may adopt other tactics, such as avoiding the tail to tackle the bomber amidships from above or below with a view to getting at the vitals of the machine and at the pilot. Gunners amidships have a slightly better chance, because there is risk of collision and the fighter must judge the distance well to avoid missing his mark and to avoid collision.

The old practice of getting into position beneath the bomber and of zooming up to fire into its belly has not as much to commend it when there is a gunner firing downwards and when it is not so easy to manœuvre a 350 m.p.h. fighter into this position against a bomber moving at up to 300 m.p.h.

So much for the bomber's defence. Now for its main job of bombing. Bomber crews are taught to bomb to within 50 ft. of accuracy from quite good heights. A circle is laid out on the ground in white paint as the target. Bombing inside this clock face is one method of training. The bomber has many calculations to make—of height, course, speed, wind strength, and wind direction, and distance from the target before he releases his cargo. Generally speaking, the bomb falls following a curve before diving straight down, and it follows the track of the bomber, hitting the ground just beneath it.

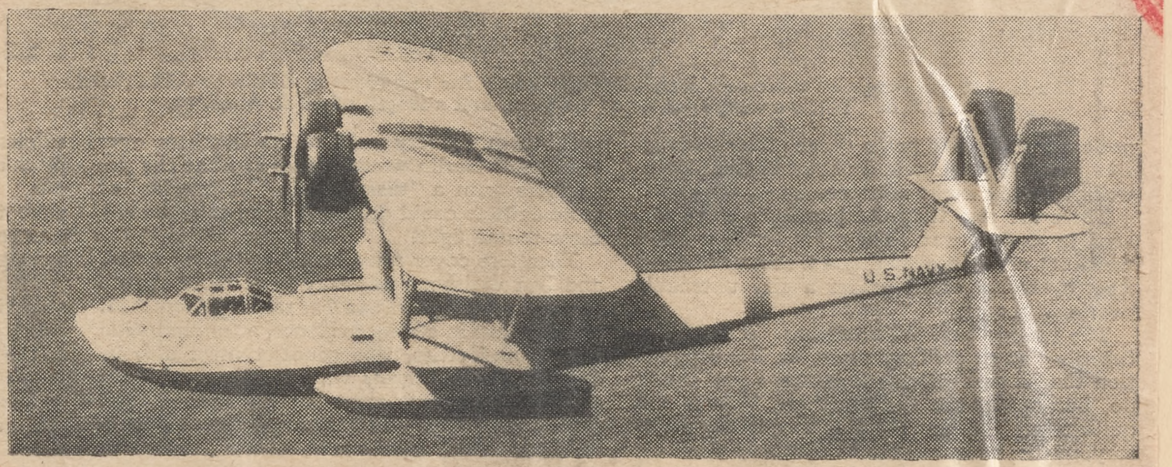
Thus a bomb load may be dropped 2 to 20 miles from a target with the object of hitting the target at the moment the bomber arrives over it. The bomb can be seen in its fall as it keeps up with the aircraft. If calculations of wind strength and direction are correct, then accurate aim results. Of course, the lower the height from which bombs are dropped, the less any error tends to grow and the better will be the aim. In the lighter class of bomber, the small bombs will be fitted to wing racks or racks beneath the fuselage. In the medium and larger class, bombs are stowed inside the fuselage and doors open to allow of their dispersal. By this plan there are no excrescencies fitted outside the aircraft to impede speed.

There are two main kinds of bombing tactics: precision bombing and dive bombing. In the former, a formation will fly to its target keeping course as far as possible. They will drop their bombs on the target while flying level and after making all the necessary calculations previously mentioned. This class of bombing is generally indulged in where the target is very big, such as a munitions plant or a railway centre, where 50 ft. of error does not impair the value of the attack, and where ground defences may be too strong to admit of a close approach at low level.

The dive-bombing plan is used when targets are smaller and where greater accuracy must be attained for the bombs to have effect. It is used for attacks on ships, for instance. Dive bombing enables the bomber to increase speed and thus elude pursuers or to outpace fighters. It gives the machine additional power to enable it to zoom away quickly to high altitude after releasing bombs. The bomber may carry only one 500-lb. or 1,000-lb. bomb. One attack on the target by each machine is all that is needed. If there has been accuracy, then every "bullet will find a billet" and the work of destruction should be complete.

Bombers dive singly to this attack, approaching the target from many different angles. This confuses ground defences and prevents A.A. guns from being brought to bear on more than one aircraft in one direction at a time. Low bombing around vital targets or around cities

This new Lockheed twin-engined single-seat fighter ordered by the U.S. War Department for the Army Air Corps shows the enormous power now needed by the fighter to give it marked superiority in performance over the bomber. The engines are liquid cooled, of high-output.



Twin-engined bomber patrol flying-boat of the United States Navy.

Australia, whose strenuous efforts to interest the Australian Federal Parliament in the proceedings did a great deal towards preparing the ground for the grant and the moral encouragement which has been given to the expedition.

For that support undoubtedly credit must be given to Major R. G. Casey, D.S.O., who was the Commonwealth Treasurer and is now the Minister for Supply and Development in the Australian Government. There is no doubt that the grant was fixed before Mr. Menzies, K.C., assumed office as Prime Minister and changed Major Casey's job for him.

The Committee at Perth was composed of Mr. C. L. K. Foot, Mr. James Woods, Mr. E. C. Gare, The Hon. Norbert Keenan, K.C., and Mr. W. G. Pickering. The careers of each of these foresighted men will be interesting because it shows the various occupations which help a man to make history.

MR. C. L. K. FOOT is a grazier who owns a small sheep run in West Australia. Before the War he was at a sheep station at Hawkes Bay, New Zealand. Then he had a cattle estancia in Argentina. During the War 1914-18 he served with the 4th Machine Gun Company in the Australian Imperial Forces until the middle of 1916 when he was wounded. After that he was attached to the Chemical Warfare Experimental Ground at Salisbury Plain, where he held the rank of Captain. After the Armistice he was a member of the Royal Commission investigating War damage and rehabilitation in Central Europe.

He has travelled in Patagonia, Uruguay, India, Canada, U.S.A. and Northern Australia. Consequently he has a fairly useful knowledge of geography and of people. And that is probably what prompted him to think of an air route across the Seychelles Islands, Cocos Islands, and Diego Garcia. They are all on minor shipping routes and consequently ordinary sea-faring people ignore their existence. A man such as Mr. Foot would naturally appreciate the importance of those islands all the more because of his varied travels. And to him must go the credit for having originated the idea.

MR. JAMES WOODS is a Scot who flew in New Zealand after the War. He joined Western Australian Airways about 1926 and flew their various Bristol Tourer and D.H.50s and 60s and later a Dragon, and he was one of the first of the West Australian pilots to fly the old D.H. Hercules between Perth and Adelaide.

In 1932 he flew alone in a Gipsy Moth from Perth to London, and later toured England in his machine with his wife. In 1934 he went to England by boat and took delivery of a Lockheed Vega for Capt. H. C. Miller and started in this machine in the MacRobertson Race to Melbourne. Unluckily the machine turned over, and he was out of the race. He returned to Perth in 1935 and was appointed Route Manager under Capt. H. C. Miller, Managing Director of the MacRobertson Miller Aviation Co. During his service Mr. Woods has taken part in many famous searches for lost airmen and explorers in the West Australian desert.

MR. E. C. GARE is an accountant and local Secretary of the MacRobertson Miller Aviation Co. He was accountant for West Australian Airways from 1929 to 1934. He was a member of the Australian Rifle Team which visited Bisley in 1928 and shot for several inter-State matches in Australia. He won the Australian King's Prize for Rifle Shooting in 1926-27 and 1933.

THE HON. NORBERT KEENAN, K.C., was elected to the Federal Parliament as Member for Kalgoorlie in 1925. He was Attorney General in the Moore Government in May, 1906, and resigned in May, 1909. He was Mayor of Kalgoorlie from 1901 to 1905 and he was elected to the Fourteenth Federal Parliament as Member for Nedlands in April, 1930, and was appointed Chief Secretary and Minister for Education in the Mitchell Government twelve days later. He resigned his office in September, 1931, and became Leader of the National Party from 1933-1938. He is still a member of the Assembly.

MR. W. G. PICKERING is a Londoner and an architect by profession. When he went to Australia a good many years ago he was attached to the Military Works Department and the Government Architects Department in New South Wales. He then moved to Western Australia as assistant to a surveyor and later took charge of a Department of Guthrie and Co., of Singapore, London and Western Australia.

Then he took up land in the South of the State and farmed for some years. He was elected to Parliament in 1917 and held his seat for some six years. He was one of the Founders of the Farmers and Settlers Association which became the Primary Producers Association, of which he was Vice-President for 8½ years. He was also President of the Dairy Section in which he led a strike which managed to get through an Act of Parliament which established a Board for the control of the Milk Industry. The Board claims that up to the present it has made an improvement to the Dairy Farmers of approximately £100,000 per annum.

While in Parliament Mr. Pickering became Chairman of the Royal Commission on Forestry which has put forestry on a footing in Western Australia which is unsurpassed by any other State in the Commonwealth. He was a member of the Royal Commission on Licensing, which procured a control o the Liquor Traffic which has been generally approved. He was also a member of the Empire Plan of Works. And with all this he had time to get n Act through the Australian Parliament which has helped largely to raise the Status of the Architectural Profession.

From this one may judge that the Imperial Reserve Route has had all along the support of a body of thoroughly representative intelligent men in Western Australia. Only one c them is an aviator and consequently they have had no pro fessional prejudice or enthusiasm for the proposition but hav viewed it simply as business men and Imperialists. Every credit is due to them for having helped to get the thing going and now they deserve every congratulation on the success o the survey. Of one thing one may be certain and that is tha none of them will get any reward for laying the foundation for what will in time prove to be one of the most importan links of the Empire.

When the announcement was made that Capt. Taylor had secured the *Guba* for the job, naturally the good people of Perth wished to have a look at the boat before it started on the expedition which they had done so much to bring about. The Committee proposed that the boat should fly round Australia from Sydney, and then fly along the old West Australian route to Perth. Also the people of Perth wanted to meet Capt. Taylor, the active head of the expedition.

Unfortunately for Perth, but very rightly, Capt. Taylor decided to fly North from Sydney to Townsville and across the Continent by way of the Gulf of Carpentaria, so that he would only have to cross a comparatively short stretch of land between Townsville and the Gulf and then across Arnhem Land to the sea and so down to Port Hedland. Consequently Capt. Taylor wrote to Mr. Dimmitt of Perth as follows:—

"It was decided between Captain Yancey of the *Guba* and myself that the aircraft would fly from Sydney *via* Townsville and North Australia to Port Hedland. This route was selected for considerations of safety and the best flying conditions of the aircraft. The Southern route, via Adelaide and Perth, introduces possibilities, in the remote event of engine failure, of overstressing the remaining engine (the *Guba* is a twin-engined flying-boat) by the necessity for some hundreds of miles of flight to suitable water for an emergency landing.

"I personally appreciate very much indeed the kind invitation which has been extended to us to fly *via* Perth. But having in mind the main objective, the flight across the Indian Ocean, I thought it best to eliminate, as far as possible, any circumstances which might adversely affect the engines or aircraft before departure. The winds and weather conditions are very much more favourable over the North Australian route in Winter, but this, of course, is not of the same importance as the other consideration. I do hope that my views in this matter will be understood."

After all that has been written in this paper and the West Australian papers about the simplicity of this flight, if only the British Navy could be prevailed upon to send ships to the three Island stopping places to act as radio communications, there is a certain quiet humour in reading in *The Western Australian* of May 19 that,—"The Federal Government has asked the British Admiralty to arrange for a warship to maintain communication with the flying-boat on the most difficult hop of the survey—that from Cocos Islands to Chagos Islands—(Diego Garcia)—but it is uncertain whether a vessel will be available."

The reports of the flight day by day show that vessels were made available when the representations became strong enough.

Why?

ONE OF THE LATEST propaganda from the United States says that the new Consolidated Aircraft flying-boat, which was illustrated in this paper on May 17. can carry fifty passengers to Europe and back, a round trip without landing, as it is believed to have a flying range of nearly 10,000 miles. But why should anybody want to fly to Europe and back without landing? Now, if it had been the other way. . . .

By the way, that Consolidated boat is not in fact an amphibian. It merely carries its own beaching gear with it, so that if it is in the water and wants to get out, or if it is out of the water and wants to get in, at a strange port there need be no trouble about finding trolleys and wheels big enough to carry such a colossal weight. But the payload must suffer terribly by having to carry such a non-paying load along with it.

When one hears of air transport firms taking out the baffle-plates from between the cylinders of radial air-cooled motors, because collectively they weigh a few pounds per motor, and thus burning up perfectly good motors for the sake of saving that bit of extra weight, one begins to realise what pence-per-ton-mile mean to some people, does not one?

Presume above was written

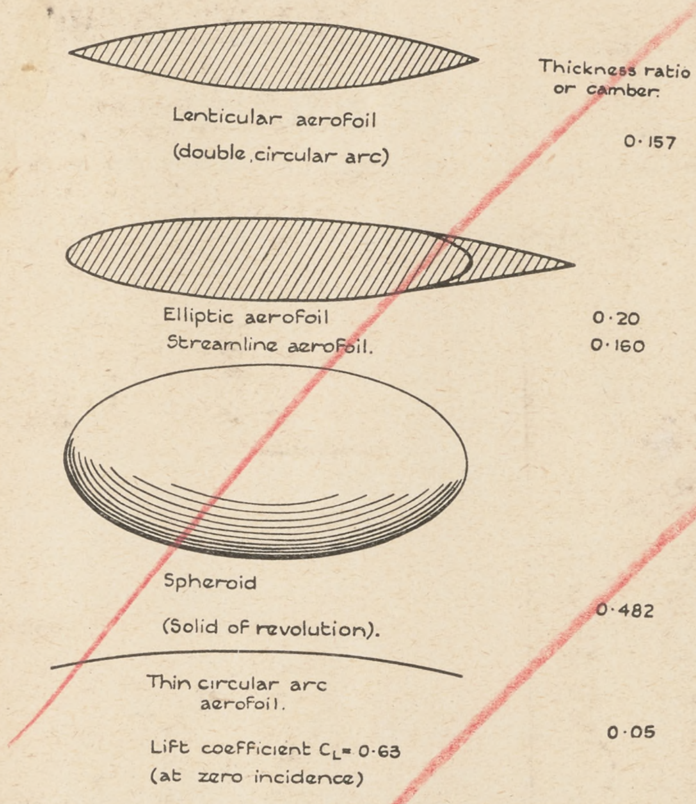
who has a bad habit of wri
anti-USA aviation propagan



IN COMMON.—Sections and one solid body given by Mr. Lock which all cause shock-waves at 525 m.p.h.

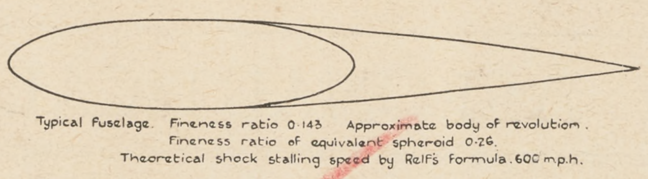
carriage. There must be no air leaks through any part of the machine.

Dr. Hilton believes that an aeroplane could be designed to do 550 m.p.h. to-day and based his suggested design on that speed. But he made the layout so that speed could be increased to more than 600 m.p.h. when more powerful motors become available.

A speed of 550 m.p.h. is .714 that of sound at sea-level. When discussing compressibility effects, high speeds are expressed as a function of the speed of sound because it falls with increase in height so that an expression in terms of speed of sound is necessary to give a true picture.

Dr. Hilton estimated the loaded weight of a 550 m.p.h. single-seat aeroplane with no payload to be 4,000 lb. On this point, in the subsequent discussion, he was accused of being unduly optimistic. He certainly was. But, as he pointed out, although an increase in weight to 6,000 lb. would put up the landing speed it would hardly reduce the maximum speed at all. The maximum speed would fall off if the wing area had to be increased to keep the landing speed down.

Low aspect-ratio is the great need for a really high-speed aeroplane. Dr. Hilton suggested an aspect ratio of 2 for his design. He decided that 95 m.p.h. was the fastest at which he could reasonably ask a pilot to land. He estimated that a maximum lift coefficient (C_L) of 1.95 for landing was the best he could reasonably expect for such a wing.



Typical Fuselage. Fineness ratio 0·143 Approximate body of revolution.
Fineness ratio of equivalent spheroid 0·26.
Theoretical shock stalling speed by Relf's formula. 600 m.p.h.

AN IDEAL.—A design given by Mr. Lock for a streamline shape which would not cause a shock-wave until the speed was 600 m.p.h. A section through this solid would seem to be much like that of the wing-section of the Consolidated Boat.

This puts the wing loading at 45.33 lb. per sq. ft. The area then has to be 88.3 sq. ft. Dr. Hilton suggested a span of 15 ft. and a root chord of 7.5 ft. for an elliptic plan form with the aspect ratio of 2.

Dr. Hilton proposes the N.A.C.A. 0012 as the wing section. It has a thickness-chord ratio of 12%. It would have a drag coefficient (C_D) of .013 at 550 m.p.h. at sea-level, and a lift coefficient (C_L) of .0588 at an incidence of 2 deg. These figures, given by Dr. Hilton, are interesting as Dr. Lewis chose this very same section for comparison with the new laminar-flow section which had about one-third of the drag at the low Reynolds Number at which the tests were made.

The induced drag coefficient for Dr. Hilton's design works out at .000108, which is negligible It is about 1% of the total wing drag.

Dr. Hilton estimated the total drag coefficient for the whole aeroplane to be .026. This means that at an airscrew efficiency of 100% the power required would be 2,590 h.p. for a speed of 550 m.p.h. For an airscrew efficiency of 75% 3,450 h.p. would be needed. The Schneider Rolls-Royce R. motors gave 2,600 h.p., guaranteed for one hour.

Dr. Hilton had very definite ideas on the installation of the motor. It must be a pusher. The slipstream behind a tractor airscrew causes the compressibility stall to occur at much slower air speeds. This is the combined effect of the turbulence in the slipstream and increased speed of the slipstream over the normal air speed.

Tractor motors in the wings will be impossible at speed of much more than 500 m.p.h.

For a single-seat aeroplane Dr. Hilton proposed a single pusher motor with oppositely rotating airscrews. He thought a tip speed of .95 times the speed of sound would be the maximum allowable and thus designed for airscrews of 6 ft. diameter to be run at 2,200 r.p.m. In the discussion he admitted that a two-motor aeroplane with motors of the maximum obtainable power might be made to go still faster.

He held out considerably more hope of really high speeds for specially built racing cars than for aeroplanes. A car can be made practically to the shape of a streamlined body of revolution and needs no wings with their inherent drag.

Wind-tunnel tests have shown that a car travelling over the ground may be regarded as casting an image through the ground identical to itself. Thus a car with a shape of a half-spheroid, half as high as wide and 7.15 times as long as wide, would have the same effect as a nearly perfect body with a compressibility stall somewhere in the region of 700 m.p.h.

The rise in temperature at sea-level by travelling at 700 m.p.h. would be about 50 deg.

Looking still further into the future Dr. Hilton foresaw aeroplanes which would have normal airscrews for take-off and alighting but at high speeds would feather their airscrews and fly with some sort of reaction-jet or by rocket-propulsion.

A New Boat with a New Wing

CHIEF FEATURE of interest in the new twin-motor Consolidated Model 31 flying-boat, which flew first early in May, is its Davis Wing. Its designer, David Richard Davis, was formerly with the Douglas Aircraft Company. His claims for his new section were confirmed by wind-tunnel tests at the California Institute of Technology (Calteck), but the authorities there were doubtful of the practical applications.

We know nothing of the section ourselves except that its designer claims for it a 20% reduction in drag compared with current designs. We assume that he has achieved this by moving the greatest depth back towards the middle from the more usual position somewhere about one-third of the chord back from the leading edge.

We also assume, in view of the doubts expressed at Calteck, that the section is very thin, or, in technical jargonese, has a low thickness-chord (t/c) ratio. This is borne out by the photographs of the new boat. Information from the United States confirms that the surface of the wing is flush-riveted.

So far there is no information about the relative efficiencies of the Davis Wing and the laminar-flow aerofoil developed by the National Advisory Committee for Aeronautics. So far there is no report that the new N.A.C.A. aerofoil has been flown.

The Model 31 has been built as a Private Venture by the Consolidated Aircraft Corporation of San Diego, California, U.S.A., and, according to report, Reuben Fleet, President and General Manager of the Corporation, has contracted to pay a handsome royalty for every Davis Wing his corporation builds.

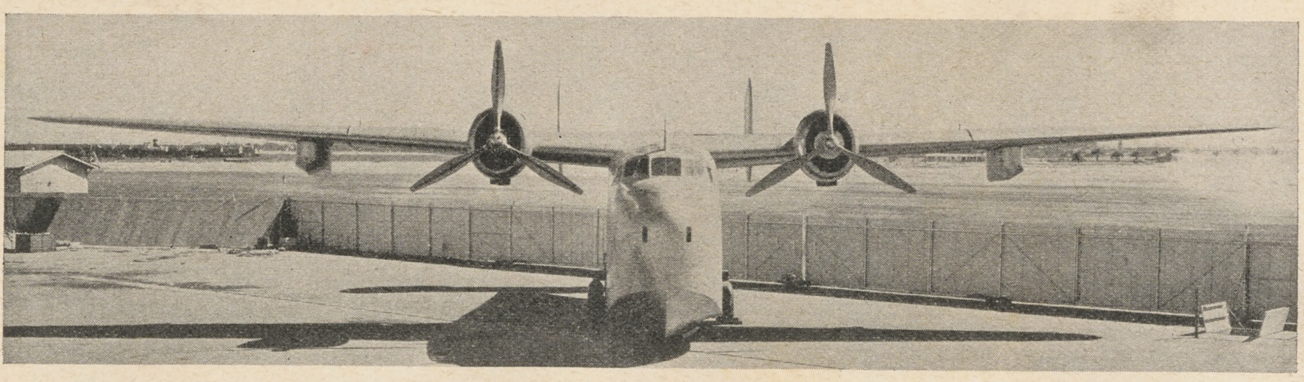
Aircraft construction in the United States seems to follow the same laws as here. We have been told that because the boat was built as a Private Venture, the design and construction, unhampered by Naval requirements, took only ten months, compared with the two or three years normally needed for an aeroplane of this size.

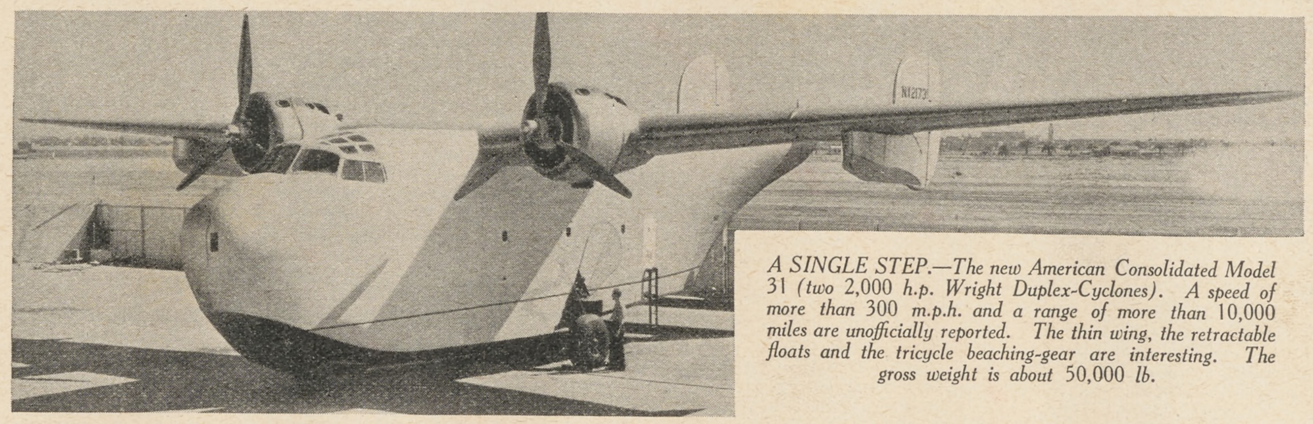
Although the Model 31 does not conform to any specification of the U.S. Navy, its makers believe that its extraordinary performance will probably cause its adoption for military work.

The Consolidated Model 31 high-wing cantilever monoplane has two 2,000 h.p. 18-cylinder Wright Duplex-Cyclone two-row radials. The gross weight is 50,000 lb. (22,660 kg.). The disposable load is supposed to be 1½ times the empty weight.

The maximum speed is quoted unofficially as more than 300 m.p.h. *Time* (New York) reports the "high speed" as 275 m.p.h.; this may mean the maximum cruising speed, which is the only speed of interest to commercial operators. If these figures are correct, the combination of load-carrying ability and speed is considerably better than that of any contemporary aeroplane.

OVER





A SINGLE STEP.—The new American Consolidated Model 31 (two 2,000 h.p. Wright Duplex-Cyclones). A speed of more than 300 m.p.h. and a range of more than 10,000 miles are unofficially reported. The thin wing, the retractable floats and the tricycle beaching-gear are interesting. The gross weight is about 50,000 lb.

In civil form the Model 31 can carry up to 52 passengers by day or 28 passengers in bunks at night. Twenty-eight passengers could be carried in comfort across the Atlantic.

Hydraulically operated Fowler flaps extend from the ailerons to the hull. The whole of the wing has stressed metal covering except for the ailerons and flaps which are fabric-covered.

The outboard floats retract into the underside of each wing. The wing-tips of the Model 31 are too small for the sideways retraction of the floats as on the earlier Consolidated PBY.

The fuel-tanks are built into the centre section in standard Consolidated fashion. The surfaces of the wing form the top and bottom of the tanks.

The motors are mounted on very small nacelles in front of the wing. They drive three-blade Hamilton Hydromatic constant-speed fully-feathering airscrews of 16 ft. (4.877 m.) diameter. The long-chord cowlings of the motors are oval in cross-section, perhaps because the carburetter intakes and oil coolers are encowled above and below the motors.

The existence of the new 18-cylinder Wright motors, rated at 2,000 h.p. each for take-off, had not been mentioned before.

The very deep hull of the Model 31 has two decks. The control cabin is above. Normally a crew of five is carried, two pilots, a flight engineer, a radio operator and a navigator. On the lower deck there are eight large compartments.

LOW DRAG WINGS

Some inferences from the reports of recent work in the United States of America

FOR years the development of wings has progressed very slowly. We have learned how to make thick wings which have not too much drag and we have gradually learned how important it is to make our wings smooth.

From the U.S.A. there has come some information about the new Consolidated flying boat with a new wing which is claimed to have much less drag than other wings. From photographs it looks little different from other wings except that it is remarkably thin. In addition it is said to be very smooth.

Effects of Turbulence

Most of the wing testing has been done in wind tunnels, notably the N.A.C.A. Variable Density Tunnel at Langley Field, Virginia. But in such wind tunnels the air is rather turbulent, and as a result certain effects are not shown. For instance, the effects of smoothness are not quite truthfully given, partly due to model size and partly to turbulence. It was only discovered a few years ago that the free atmosphere is not turbulent, that is, not turbulent in a degree which affects wings. Long before that some German free flight tests showed that wings if really smooth could have very low drags indeed, but people did not believe the results for a long time.

Some years later we did similar tests in this country and got just as low drags. Then large models were tested in a non-turbulent tunnel in Germany and drags were found that were 15 per cent. less than those measured in the U.S.A. at the same Reynold's Number in the Variable Density Tunnel. But the results of such work are not quite clear, for in the non-turbulent tunnel the model was larger and relatively smoother than in the turbulent tunnel, so there are effects both of smoothness and turbulence combined. Even if the flow were fully turbulent the smoothness should reduce the drag, but the lack of turbulence will reduce it still further.

Dr. Lewis of the N.A.C.A. in his lecture before the Royal Aeronautical Society described the new low turbulence wind tunnel at Langley Field and stated that they had discovered new aerofoil shapes which have drags very much lower than present types. A description of a demonstration at Langley Field states that there exists "a low drag boundary layer over almost its entire surface, and the demonstration showed that its drag is only a fraction of that of the conventional wing."

It may be that the Consolidated boat uses the wing as developed at Langley Field, although it has been stated that it was invented by a member of the Consolidated staff. At any rate it is likely that it uses the same principle to reduce the drag as does the N.A.C.A. wing, and that is obviously some means of delaying the transition of the laminar boundary layer.

Structural Problems

Although we do not yet know just exactly how the wing is shaped in section, we can say that it combines smoothness and careful attention to the curvature over the front portion. This question of smoothness raises a very important matter. It is difficult to attain real trueness of section unless the wing is covered over the front portion with thick plywood or metal or plastic. If weight is not to be wasted, some type of structure should be adopted which tends to concentrate structure over that part, such as the single spar "D" nose type.

A really smooth wing will have no rivet heads and in detail and general fairness of surface will be as mirror-like as any modern car coachwork. But there is an associated problem with these low-drag wings. No matter what trouble is taken, a rubber de-icer along the leading edge will break up the laminar flow and spoil any attempt to lower the drag below present values. De-icing paste would do likewise, for it also increases roughness.

Another problem in multi-engined types is the slipstream behind propellers. Such slipstreams are turbulent, so that behind tractor propellers the laminar flow ceases at the stagnation point on the wing which is just at the leading edge. There is thus little use trying to produce a refined wing and place airscrews in front of it.

So it is seen that if we are to be able to use a low-drag wing, we may have to alter our wing structure, most certainly our present de-icing methods and use pusher airscrews. The last item alone means a revolution in design.

Perhaps this possibility of reducing the drag of our wings may result in great changes in our aeroplanes, and if it does the changes will start soon.

THE CONSOLIDATED 31

Monoplane with semi-monocoque hull.

Outer covering of aluminium-coated aluminium alloy.

Planing surface of the bottom flush riveted.

Fixed tail surfaces flush riveted.

Moveable surfaces fabric covered.

Wing span approximately 110 ft. Maximum chord 14 ft.

Wings are full cantilever flush riveted, made in three sections the centre section with integral fuel tanks.

Fowler trailing edge flaps hydraulically operated.

Retractable outboard floats.

Airscrews are 16 ft. diameter Hamilton Standard hydromatic full-feathering.

As commercial air liner 52 passengers and crew of five can be carried.

A hydraulically operated, retractable tricycle beaching gear is fitted.

First flight at San Diego was made ten months after the flying-boat was conceived. It was built as a private venture.

Engines are 18 cylinder double row Wright Duplex-Cyclones each of 2,000 h.p., as shown below.

CONSOLIDATED PLANT OKEHED

Council Will Permit Three-Story Structure

While Consolidated Aircraft Corp. officials await word almost momentarily from the Navy Department regarding its low bid for approximately $20,000,000 in new construction, first step in the plant's expansion program has been made possible by the City Council.

An amendment to the city's building code has been adopted to allow construction of three-story all-steel buildings, primarily at Consolidated's request. Previous regulations permitted only frame buildings higher than two stories.

3-STORY PLANT

The aircraft plant, however, planned to build a three-story steel 60 by 180-foot structure for temporary use as an office building, to be converted later for manufacturing purposes. Plant Engineer William A. Maloney requested the ordinance change of the Board of Examiners and Appeals, whose favorable recommendation was approved by the Council.

DECISION ANY DAY

Maj. Reuben H. Fleet, president, declared yesterday that he was expecting to hear "any day" of the Navy's decision on award of the contract for building a large number of advanced PBY-type bombers.

Total plant enlargement contemplated by the firm will provide 92 per cent extra floor space in a 400 by 900 foot addition, to be located just north of the present factory, on 17 acres of land recently leased from the city.

Union 11-16-39

16 Congressmen To View Local Plane Plants

Sixteen congressmen from the senate and house military affairs committee and the senate appropriations committee are to arrive at 2:25 p.m. Nov. 28 by air for a one-day visit of airplane manufacturing plants and civil schools engaged in training air cadets.

The solons are coming in three transport planes. They are headed by Sen. Elmer Thomas, chairman of the senate subcommittee on appropriations for the war department, and Rep. Andrew J. May, chairman of the house military affairs committee.

Other congressmen in the party will be Sens. Harry S. Truman, appropriations subcommittee; Sherman Minton, Chan Guerney and H. H. Schwartz, senate military affairs committee; Reps. R. Ewing Thomason, Andrew Edmiston, Edwin M. Schaefer, John M. Costello, Overton Brooks, John J. Sparkman, Charles R. Clason, Paul W. Shafer, William D. Byron and Thomas E. Martin, house military affairs committee.

After an overnight stay here they are to leave at 1 p.m. Nov. 29 for March field, Riverside, and Los Angeles. After inspections in the Los Angeles area they are to go northward, visiting Sacramento, San Francisco, Ft. Lewis, Wash., Salt Lake City, Ogden and Cheyenne.

Accompanying the congressmen will be Maj. Arthur R. Wilson, war department general staff, and Maj. John E. Upston, air corps.

Sun 11-16-39

MILLION DOLLAR NAVY BASE FOR PACIFIC

HONOLULU, Nov. 16. — First steps toward construction of a $1,100,000 base for a squad of Navy patrol bombers at Palmyra Island was taken today when a survey party left the Pearl Harbor Navy base on the mine layer Preble for Palmyra, 1000 miles south.

Other bases are planned at Midway Island, Wake Island and Johnston Island, in the mid-Pacific. They are provided for in Navy appropriations bill passed last spring.

ENGINES FOR S. D. PLANES ORDERED

Sun 11-20-39

Cotracts totalling $13,000,000 have been awarded by the War Department to United Aircraft Corp., East Hartford, Conn., to supply aircraft manufacturers, including the Consolidated and Ryan plants in San Diego.

Included in the orders were an undisclosed amount of 1380 horsepower engines for the new four-motored Army bombers under construction at Consolidated, and for 420 horsepower engines to be installed in Ryan observation planes.

Sun 11-17-39

Congressmen To Inspect Air Industry, Schools

To inspect San Diego's aircraft industry and civilian schools training military fliers, 16 Congressmen of the Senate and House Military Affairs Committees will arrive here by plane Nov. 28 for a 24-hour stay.

In the group, headed by Sen. Elmer Thomas, chairman of the Senate subcommittee War Department on appropriations, and Rep. Andrew J. May, chairman of the House Military Affairs Committee, will be:

Sens. Harry S. Truman, Sherman Minton, C. Guerney, and H. H. Schwartz, and Reps. R. Ewing Thomason, Andrew Edminston, Edwin M. Schaefer, John M. Costello, Overton Brooks, John J. Sparkman, Charles R. Clason, Paul W. Shafer, William D. Byron, and Thomas E. Martin.

The solons will continue north in three Army transport planes, and are due to visit March Field, Los Angeles, Sacramento, San Francisco, Ft. Lewis, Wash., Salt Lake City, Ogden and Cheyenne.

Air Deliveries Barred Under Federal Ruling

WASHINGTON, Nov. 16 (A.P.)—American warplanes can be pushed or pulled across the border for delivery in Canada, government officials held informally today, but they cannot be flown across under their own power.

This is their conclusion after days of discussion of one of the most intricate problems raised by the neutrality act.

TAX EASE PLAN AIDS CONSOLIDATED EXPANSION

COMPANY READY TO ACCEPT NAVY BOMBER ORDER

Delay In Award Due To Previous Uncertainty Of Financing Plant

By HAROLD KEEN
Aviation Editor

Consolidated Aircraft Corp. officials were jubilant today over apparent establishment by the Administration of a policy that will facilitate a plant expansion program designed to double floor space of the San Diego concern.

President Roosevelt, according to Washington reports, has assured the Army and Navy of preferential tax treatment for manufacturers who intend to expand facilities which could be used to provide national defense needs.

S. D. FIRM BIDS LOW

The San Diego firm was low bidder on a large number of Navy patrol bombers, with the contract expected to run as high as $20,000,000.

Delay in the anticipated award has been caused by uncertainty of methods of financing and amortizing the investment for an enlarged plant needed to turn out the bombers—probably as many as 200—in rapid order.

Cost of the huge factory addition, it was learned authoritatively, may be as great as $2,000,000.

COSTS COMPUTED

Under the Administration's plan the Treasury Department would set forth in advance of completion of contracts the manner in which the Internal Revenue Bureau would treat the cost of any special facilities in computation of the maximum profits allowed under the Vinson-Trammel Act—10 per cent on Naval vessels, and 12 per cent on Military and Naval aircraft.

Normally, the cost of new facilities may be amortized by depreciation or obsolescence allowances determinable only on completion of the contract.

When the Army and Navy certifies to the treasury that installation of new equipment is necessary for the national defense program and that after completion of the contract such facilities will be useless, the treasury and contractor then will agree on the fixed percentage of reasonable cost to be charged when the profits are computed within limitations of the Vinson Trammell Act.

EXPANSION ABSORBS PROFIT

The difficulty in Consolidated's case was that a large percentage of its profits on the pending Navy contract would be absorbed by the plant expansion cost, and that this increase in facilities might not be practical for a normal volume of future work—following the war emergency—once the Navy deliveries have been completed.

News of the government's attitude was received by Maj. Fleet today with a note of optimism. He saw in it a possible paving of the way for award of the $20,000,000 contract, and construction of the plant addition, to the satisfaction of both the contractor and the Navy.

"Companies are loathe to expand for a war emergency where their profit is limited by law and where they would end up with excess facilities that would probably be idle after the emergency is past," Maj. Fleet said today.

"Apparently the Administration, in order to get its requirements accelerated, is authorizing its contractors who are willing to increase production for them, to charge off part of the cost of the excess facilities to the contract work to be performed."

U. S. Plans Aid To Encourage Plane Building

Tribune 11-20-39

WASHINGTON, Nov. 20 (A.P.)—Treasury officials today said they were considering an extension of their policy to encourage construction of new airplane and other types of factories connected with national defense by granting more liberal depreciation allowances.

In applying the 10 percent limitation on profits made on naval contracts, the present policy enables an armament manufacturer to charge off as expenses in relatively few years the cost of building a factory. Officials said this was done on the theory that in a few years the plant may have outlived its usefulness.

In the years in which larger depreciation allowances are permitted, profits as measured for tax purposes, are decreased by offsetting large amounts of depreciation against income. However, after all of the value of a new factory has been charged off, taxes might be higher for lack of such offsetting bookkeeping expenses.

The question of extending the practice has been brought to the attention of the treasury primarily by plane manufacturers and the army and navy. The question has particular importance now because of the plans of some airplane manufacturers to build new factories to meet allied orders.

S. D. To Be Host To Solon Group Tomorrow

Trib-Sun 11-27-39

Four senators and eight representatives, members of the senate and house military affairs committees and the senate appropriations subcommittee, are scheduled to arrive here by plane at 1:35 p.m. tomorrow for an overnight stay to inspect local aircraft factories and Ft. Rosecrans. Telegraphic advices received by the chamber of commerce state the group is en route here from San Antonio, Tex., following a tour of Central American countries and Mexico.

A stag dinner honoring the party will be given by the city-county-chamber of commerce at 7:30 p.m. tomorrow at Hotel del Coronado. During their stay here, they will visit Consolidated, Ryan and Solar aircraft plants, inspect Ft. Rosecrans and view activities of air cadets now in training at the Ryan school.

Sen. Elmer Thomas, of Ohio, chairman of the senate sub-committee on appropriations for the war department, heads the group. With him are Sens. Harry S. Truman, of Missouri, member of the same subcommittee, Sherman Minton, of Indiana, and Chan Guerney, of South Dakota, members of the senate military affairs committee, and the following, all members of the house military affairs committee: Reps. R. Ewing Thomason, of Texas; John M. Costello, of California;

City To Be Host To Visiting Solons

CONTINUED FROM PAGE ONE

Overton Brooks, of Louisiana; John J. Sparkman, of Alabama; Charles R. Clason, of Massachusetts; Paul W. Shafer, of Michigan; William D. Byron, of Maryland, and Thomas E. Martin, of Iowa.

The party will arrive in three army transport planes. With them are Maj. Arthur R. Wilson, of the war department general staff, and Maj. John E. Upston, from the office of the chief of the air corps.

Welcoming Group Named

From San Diego, the congressmen will go to the Los Angeles area and San Francisco. The Associated Press reported they are to inspect the new army air repair depot at Sacramento, which took the place of San Diego's Rockwell field, Dec. 4. The remainder of their tour takes them to the Pacific northwest and thence to Washington, D. C., via Cheyenne, Denver, Ft. Leavenworth, St. Louis and Wright field, O.

The last stop the congressmen are scheduled to make before arriving at San Diego is Ft. Huachuca, Ariz.

Army officers welcoming them upon their arrival at Lindbergh field will include Gen. Jacob E. Fickel, commanding March field, Riverside, and Col. Robert E Guthrie, commanding Ft. Rosecrans.

All San Diego inspections will be made tomorrow afternoon, according to present plans. The group is to leave at 9 a.m. Wednesday for March field and Long Beach.

The visit to San Diego is important because of the army aircraft manufacturing program now in effect here. Consolidated is building 4-engined motors for the army air corps, in addition to navy patrol bombers. Ryan is building army training planes and giving instruction to army air cadets. The Solar Aircraft Co. is manufacturing parts for planes.

THIRTEEN CONGRESSMEN TO INSPECT S. D. AIR PLANTS, DEFENSES TODAY

Union 11-28-39

Thirteen congressmen—five senators and eight representatives—of the powerful senate and house military affairs committees and the senate appropriations committee, are to arrive this afternoon at 1:35 by plane for a 19-hour visit to study aircraft production and defense facilities of this area. Inadequacy of local defense facilities to protect the port in the event of withdrawal of the navy and marine forces will be stressed to the visiting solons, who are to be taken on a trip to Ft. Rosecrans to see the antiquated equipment at that coast-defense station.

DEFENSE SAID INADEQUATE

A study of the local defense picture, completed recently by chamber of commerce committees, is to be laid before the congressmen. Action to remedy the defenses by modernizing Ft. Rosecrans long has been sought and recently Sen. Hiram Johnson promised "careful consideration" of the problem here. He is not, however, on the list of visiting congressmen.

With the departure of the fleet and the fleet marine force in event of war the base establishments valued at $40,000,000 would be left virtually unprotected, chamber leaders declared. Ft. Rosecrans guns are outranged by any battleship a major power might send against them and the personnel is so small it was doubted if there would be enough men to man even the guns now there.

Anti-aircraft guns also are badly needed here, it was said. While the national guard regiment is an anti-aircraft unit, it might be withdrawn for use elsewhere along the coast and if it remained it would suffer from lack of sufficient modern guns.

TO INSPECT AIR PLANTS

On arrival here this afternoon the visiting congressmen will be met by city and county officials, aircraft and training executives and Col. Robert E. Guthrie, commanding Ft.

(Continued on Page A, Col. 1)

Solons to View S. D. Defenses

Rosecrans. Gen. Jacob Fickel, commanding March field, Riverside, also may fly down to greet the visitors.

The afternoon will be spent in inspections at Consolidated, Ryan and Solar aircraft factories, Ryan and Speer aviation-training centers, and Ft. Rosecrans.

A stag dinner honoring the congressmen will be given by the city, county and chamber of commerce at Hotel del Coronado tonight, 7:30. The visitors are expected to leave in their army transport planes for March field tomorrow, 9 a.m.

Heading the delegation will be Senators Elmer Thomas, Oklahoma, chairman of the senate subcommittee on war department appropriations; Sherman Minton, Indiana; Harry S. Truman, Missouri,; Chan Guerney, South Dakota, all of the senate military affairs committee, and Sen. Dennis Chavez, New Mexico; Reps. R. Ewing Thomason, Texas; John M. Costello, California; Overton Brooks, Louisiana; Charles R. Clason, Massachusetts; Paul W. Shafer, Michigan; William D. Byron, Maryland; Thomas E. Martin, Iowa, and John J. Sparkman, Alabama, all members of the house military affairs committee.

Accompanying the party will be Majors Arthur R. Wilson, war department general staff, and John E. Upston, air corps.

11 SOLONS ARRIVE IN S. D. FOR ARMAMENT INSPECTION

See New Bomber at Consair Plant; Will Leave Today for March Field

On the mast comprehensive aerial tour of the nation's defenses ever attempted by any congressional party, four senators and seven representatives arrived late yesterday for an inspection of lacol defense needs and a study of the part San Diego is playing in the aerial rearmament of America. The congressmen roared down to Lindbergh field at 4:30 in three army transports and immediately went to the Consolidated aircratf plant to inspect the work being done there. Under guidance of Maj. Reuben Fleet, Consolidated head, they were shown the new army bomber, a four-motored craft whose capabilities are clothed in military secrecy, but which is said to have a speed greater than any large bombing craft in the world today.

FIRST PLANT VISITED

It was the first aircraft factory the congressmen had seen on their 8000-mile tour which began Nov. 9 at Washington and included a visit to every Central American country en route to Panama, where the vital canal link was studied, and thence back through Mexico and the southwest to San Diego.

They showed great interest in the fabrication of the army ship—all the congressmen are connected either with the house and senate military affairs committee or the house or senate subcommittees on appropriations for the army—and also in the construction of the famous navy PBY type craft, pioneered by the San Diego firm.

Afterward they were shown a motion picture of Consolidated operations which took in departments the visitors were unable to inspect because of time limitations.

In the evening they were guests of the city, county and chamber of commerce at Hotel del Coronado.

DREDGE WORK URGED

Advisability of immediate action to dredge an area adjacent to Ft. Rosecrans, to add 15 acres to the land available for coast defense works at an approximate cost of $80,000, was stresesd at the dinner by Maj. Gen. H. B. Fiske, U.S.A. ret. and members of the chamber of commerce military committee. Advisability of adequate anti-aircraft protection for the San Diego naval base, and for more modern artillery at Ft. Rosecrans also was impressed on the visitors.

Aboard the army transports when

(Continued on Page 2, Col. 8)

Canal Lacks Air Defenses

The Panama canal—vital link in the national defense picture is virtually defenseless from air attack, Sen Elmer Thomas (D-Okla), chairman of the senate subcommittee on war department appropriations, declared yesterday on his arrival with a congressional party which has been inspecting army outposts to the east and south.

"It seems to be adequately protected against sea or land attack," said the senator, as he paused on his arrival at Lindbergh field aboard an army transport plane. "But it has no adequate air defense. There are big guns there and army stations. Also there are a lot of planes. But I didn't see an anti-aircraft gun while I was there. The vital need, I would say, is for better anti-aircraft protection of the canal."

Sen. Thomas said the lack of anti-aircraft guns was apparent not only at the canal but everywhere the party has visited. Asked whether he would recommend additions of equipment along this line he said the purpose of the congressional party was to get a picture of the needs of the military establishment and it was the war department's business to make recommendations on necessary defense weapons.

Never before in history, the senator said, has a congressional com-

(Continued on Page A, Col. 8)

Canal Lacks Air Defenses

(Continued from Page 1)

mittee undertaken a more comprehensive check-up of national defense. Leaving Washington Nov. 9 in three army transports, the party, comprising members of four major committees—house and senate military affairs bodies, and house and senate subcommittees on war department appropriations—has traveled 8000 miles and still has 4000 to go before completing its journey at Washington about Dec. 15.

"Only in this manner can we familiarize ourselves with the points and conditions which the war department will outline in its requests for appropriations," he said. He emphasized that this was no congressional junket, as the solons often had to rise at 5 a.m. to make their schedule and spent long hours in the air.

---

11 Solons Arrive For Inspection Of S. D. Defenses

(Continued from Page 1)

they dropped to Lindbergh field were Sens. Elmer Thomas, Oklahoma; Sherman Minton, Indiana; Dennis Chavez, New Mexico and Harry S. Truman, Missouri; Reps. John Martin Costello, California; Overton Brooks, Louisiana; Charles Russell Clason, Massachusetts; Paul W. Shafer, Michigan; John J. Sparkman, Alabama, and Thomas Ellsworth Martin, Iowa.

TRIP UNPRECEDENTED

"Never before so far as I have heard have members of the four committees concerned with war department appropriations made a trip like this," said Sen. Elmer Thomas, who headed the party.

The committee's tour will include defense points up to the Canadian border, thence across the country to take in munitions, armament and aircraft factories, along with various military posts en route.

This morning the congressmen will inspect the Ryan and Solar aircraft plants and the army primary training school at the Ryan aeronautics division. The visitors are to leave at 9 a. m. for March field, Riverside, going thence to Los Angeles for a two-day inspection of air schools and aircraft factories before proceeding northward.

AIDS ACCOMPANY SOLONS

Accompanying the congressmen as military aids are Majs. Arthur R. Wilson of the war department general staff, who was largely instrumental in arranging the itinerary of the party, and John E. Upston, from the office of the chief of air corps.

Brig. Gen. Jacob E. Fickel, commanding the First Wing, army air corps G. H. Q., whose headquarters are at March field, flew here yesterday and greeted the vistiors. He will fly with them to March field this morning.

Gen. Fickel commands army air activities on the west coast, where there are three fields—March, Moffett and Hamilton—with another under construction at Tacoma.

Gen. Fickel reported that March field is in process of expansion which will add 600 men and 25 officers to the personnel. There are 110 planes there, while a modernizing program will call for 60 new pursuit craft and 30 bombers of the flying fortress type to replace some of the older equipment on hand.

Plane Contract Expected Soon By Consolidated

Possibility that the Consolidated Aircraft Corp. may receive a $20,000,000 contract this week for construction of an undisclosed number of new long-range offshore patrol bombers, was expressed yesterday by Consolidated officials.

Maj. R. H. Fleet, president of the municipal airport plant, flew to Washington last week for final conference with naval authorities.

The navy department recently announced that Consilidated submitted the lowest bid for the construction of twin-motored bombers. Two hundred twenty-five of this type plane have been built at Consolidated for the navy since the factory was established here.

EXPANSION COSTLY

It is reported one of the chief obstacles in award of the contract is the insistence of Consolidated officials that the government stand the expense of constructing the new building in which the bombers would be built. The estimated cost is said to exceed $1,000,000. The factory is working to capacity on army and navy contracts.

The proposeod plant expansion would increase the present floor space by 92 percent. The building would be 400 by 900 feet.

NAVY ASKED TO PAY

Maj. Fleet contends the navy department should bear the greater part of the expense of the new factory as the building would not be used under normal manufacturing conditions in the aircraft industry.

More than $100,000,000 in contracts are being completed by southern California aircraft companies for the American and foreign governments. All these factories, except Consolidated, have expanded their facilities to meet the increasing demand for airplanes.

The proposed new factory at Lindbergh field would employ from 2000 to 3000 men but Consolidated officials point out at least six months would be required to construct the factory after the navy department has awarded the $20,000,000 contract.

TAX EASE PLAN AIDS CONSOLIDATED EXPANSION

COMPANY READY TO ACCEPT NAVY BOMBER ORDER

Delay In Award Due To Previous Uncertainty Of Financing Plant

By HAROLD KEEN
Aviation Editor

Consolidated Aircraft Corp. officials were jubilant today over apparent establishment by the Administration of a policy that will facilitate a plant expansion program designed to double floor space of the San Diego concern.

President Roosevelt, according to Washington reports, has assured the Army and Navy of preferential tax treatment for manufacturers who intend to expand facilities which could be used to provide national defense needs.

S. D. FIRM BIDS LOW

The San Diego firm was low bidder on a large number of Navy patrol bombers, with the contract expected to run as high as $20,000,000.

Delay in the anticipated award has been caused by uncertainty of methods of financing and amortizing the investment for an enlarged plant needed to turn out the bombers—probably as many as 200—in rapid order.

Cost of the huge factory addition, it was learned authoritatively, may be as great as $2,000,000.

COSTS COMPUTED

Under the Administration's plan the Treasury Department would set forth in advance of completion of contracts the manner in which the Internal Revenue Bureau would treat the cost of any special facilities in computation of the maximum profits allowed under the Vinson-Trammel Act—10 per cent on Naval vessels, and 12 per cent on Military and Naval aircraft.

Normally, the cost of new facilities may be amortized by depreciation or obsolescence allowances determinable only on completion of the contract.

When the Army and Navy certifies to the treasury that installation of new equipment is necessary for the national defense program and that after completion of the contract such facilities will be useless, the treasury and contractor then will agree on the fixed percentage of reasonable cost to be charged when the profits are computed within limitations of the Vinson Trammell Act.

EXPANSION ABSORBS PROFIT

The difficulty in Consolidated's case was that a large percentage of its profits on the pending Navy contract would be absorbed by the plant expansion cost, and that this increase in facilities might not be practical for a normal volume of future work—following the war emergency—once the Navy deliveries have been completed.

News of the government's attitude was received by Maj. Fleet today with a note of optimism. He saw in it a possible paving of the way for award of the $20,000,000 contract, and construction of the plant addition, to the satisfaction of both the contractor and the Navy.

"Companies are loathe to expand for a war emergency where their profit is limited by law and where they would end up with excess facilities that would probably be idle after the emergency is past," Maj. Fleet said today.

"Apparently the Administration, in order to get its requirements accelerated, is authorizing its contractors who are willing to increase production for them, to charge off part of the cost of the excess facilities to the contract work to be performed."

U. S. Plans Aid To Encourage Plane Building

Tribune 11-20-39

WASHINGTON, Nov. 20 (A.P.)—Treasury officials today said they were considering an extension of their policy to encourage construction of new airplane and other types of factories connected with national defense by granting more liberal depreciation allowances.

In applying the 10 percent limitation on profits made on naval contracts, the present policy enables an armament manufacturer to charge off as expenses in relatively few years the cost of building a factory. Officials said this was done on the theory that in a few years the plant may have outlived its usefulness.

In the years in which larger depreciation allowances are permitted, profits as measured for tax purposes, are decreased by offsetting large amounts of depreciation against income. However, after all of the value of a new factory has been charged off, taxes might be higher for lack of such offsetting bookkeeping expenses.

The question of extending the practice has been brought to the attention of the treasury primarily by plane manufacturers and the army and navy. The question has particular importance now because of the plans of some airplane manufacturers to build new factories to meet allied orders.

S. D. To Be Host To Solon Group Tomorrow

Trib-Sun 11-27-39

Four senators and eight representatives, members of the senate and house military affairs committees and the senate appropriations subcommittee, are scheduled to arrive here by plane at 1:35 p.m. tomorrow for an overnight stay to inspect local aircraft factories and Ft. Rosecrans. Telegraphic advices received by the chamber of commerce state the group is en rout here from San Antonio, Tex., following a tour of Central American countries and Mexico.

A stag dinner honoring the party will be given by the city-county-chamber of commerce at 7:30 p.m. tomorrow at Hotel del Coronado. During their stay here, they will visit Consolidated, Ryan and Solar aircraft plants, inspect Ft. Rosecrans and view activities of air cadets now in training at the Ryan school.

Sen. Elmer Thomas, of Ohi chairman of the senate sub-committee on appropriations for the w department, heads the group. Wi him are Sens. Harry S. Truman, Missouri, member of the same subcommittee, Sherman Minton, of Indiana, and Chan Guerney, of South Dakota, members of the senate military affairs committee, and the following, all members of the house military affairs committee: Reps. R. Ewing Thomason, of Texas; John M. Costello, of California;

SOME JOBS FOR BIG BOMBERS

Evening Gazette 12/16/40

By EDWARD RUGG

NOW that the first of the much-heralded four-engined bombers are due from America, the taxpayer who foots the bill is entitled to ask what are we going to do with them?

First of all a little de-bunking will do no harm. The skies over Britain are not black with giant 'planes from the States bigger than anything we have ever seen.

Nor are they the world's biggest military aircraft. Actually, they are rather smaller and considerably lighter than our own Sunderland flying-boats.

They are of two types. Some are very modern, very efficient machines built by the Consolidated concern and measuring 110 feet from wing-tip to wing-tip. They are said to weigh 40,000lbs. fully loaded, to have a maximum speed of 300 m.p.h., and to carry a maximum bomb load of four tons.

It need hardly be said that all these conditions do not occur at one and the same time, and it is no criticism of the Consolidated to point out that our own Wellingtons can be given a longer range while our Beauforts have a higher speed.

The others are Boeing B 17 B "flying fortresses," much older, somewhat smaller, and with a top speed no greater than the Hampden or Wellington. The suggestion that they have a range of 4,200 miles is in a way correct, but at that range their bomb load would hardly be worth the journey.

◆

ALL this notwithstanding, they remain a most worthwhile contribution to our striking force. They should have at least two valuable qualities inherent in their very size.

It is a thousand pities the American Army Air Corps would not release the latest Nordern bomb-sight for our use, but the Sperry sight, with which these machines are equipped, is said to be excellent, and bombers of this size should be very steady in the air. It needs little imagination to see that slight unsteadiness at the moment of release means that the bomb falls far from its intended target.

Secondly, while we already have bombers capable of penetrating to the furthest corner of Germany, these four-engined machines can go there with a useful bomb load.

The whole of Germany and most of the German-occupied territory is within a thousand miles of London. In practice it is unlikely that the newcomers will be sent quite so far afield. They will probably be used against targets nearer home, carrying more and/or bigger bombs than our twin-engined machines can accommodate.

For example, even before British bombers began to devastate the Ruhr industrial area, German industry, and especially the arms industry, had started to move towards the East and South-East. To-day there are numerous factories in South-Eastern Germany, to say nothing of occupied Poland and Czecho-Slovakia which are overdue for an unfriendly visit from the R.A.F.

If one half of the 26 American machines could be used every 24 hours, a most impressive amount of damage might be done and the moral effect would be enormous on workers who have hitherto believed themselves immune from British bombs.

◆

IT would obviously be hardly worth while going to some giant factory to drop one or two bombs of medium size per 'plane. Allowing for the proportion which might be expected to miss their mark, the effect might even be opposite from that we desired, since local Nazis would point derisively at the small striking power as they would say of the much-vaunted R.A.F.

But let even a small number of 'planes drop four tons of bombs per machine and acres of havoc might be caused by a single well-conducted raid.

Again, there are certain targets, and some of them the furthest afield from Britain, where a large number of bombs must be used to give best results.

When you bomb a railway, for instance, you are a super-optimist if you hope to hit first time.

Now among other things it is vital that we should do all we can to interrupt the supply of oil from Rumania to Germany.

Normally the vast water-way based on the Danube and the Rhine is used for this purpose by long strings of barges. During the next few months, however, much of this will be frozen solid and the already overworked railways between the two countries will be still further taxed. If our bombers can cause a long series of interruptions on the limited number of these lines we shall have scored a major success.

On the other hand, those responsible for our air strategy may prefer to concentrate on a few bridges at specially selected points.

Here we have the reverse set of circumstances. A bridge is a most difficult object to hit from the air, and it is surprising how much bombing a modern steel bridge will stand up to.

Direct hits from bombs of moderate size may interrupt traffic for a few days, but that is all. But if we can send over a squadron of super-bombers, each carrying two or three missiles of the largest size, we can hope to destroy vital bridges and so hold up the traffic for months on end—an objective which, once attained, would justify many successful raids.

◆

THERE is another target which may also call urgently for attention.

We know that the new German battleships Bismarck and Tirpitz are practically completed, even if not actually in service. These two ships, with their 15-inch guns, will much more than double the gun-power of the High Seas Fleet, and at least two sister ships are under construction.

It is of the utmost importance that the two first-named should not be left in a seaworthy condition to cancel out, so to speak, certain powerful units of the British Navy. Yet that Navy cannot get at them with its own guns while they skulk in harbour. **The only solution is to bomb them out of existence.**

This is easier said than done. The modern battleship is specially defended against air attack. Only the heaviest bombs in use would do more than superficial damage, and to render the Bismarck hors de combat for an indefinite period would require several direct hits with these.

It may be taken for granted that the pride of the Nazi Navy is simply surrounded with defences of all kinds. Only under the most favourable circumstances, one imagines, would our bomber command try to press home an attack on the Taranto scale. Yet occasionally weather conditions come along which are just right

When there exist one or two squadrons of machines capable of doing the 800 mile round trip to the German naval bases and of dropping three or four ton bombs per machine when they get there, we shall be in a position to make the most of the chance as soon as it comes our way.

In this way a single successful raid may well dispose of a real menace for good.

So much for some of the practical uses to which the new bombers may be put. As a footnote one may forecast a gathering of English designers around the first Consolidated 'plane to arrive. For these bombers make use of the Davis aerofoil wing hailed in America as the greatest structural advance since the Wellington designer, Mr. B. N. Wallis, adapted geodetic construction methods for use in manufacturing British bombers.

SENATORS, REPRESENTATIVES VIEW ARMY, NAVY DEFENSES ON TOUR HERE

Members of the congressional military affairs inspection party on arrival at Lindbergh field yesterday afternoon. Left to right: Sen. Elmer Thomas, Sen. Harry S. Truman, Rep. Paul W. Shafer, Sen. Sherman Minton, Sen. Dennis Chavez, Rep. Overton Brooks, Rep. Thomas E. Martin, Rep. John J. Sparkman, Rep. John M. Costello and Rep. Charles R. Clason. Rep. William D. Byron arrived by another plane later.

* * *

11 SOLONS ARRIVE IN S. D. FOR ARMAMENT INSPECTION

See New Bomber at Consair Plant; Will Leave Today for March Field

On the mast comprehensive aerial tour of the nation's defenses ever attempted by any congressional party, four senators and seven representatives arrived late yesterday for an inspection of lacol defense needs and a study of the part San Diego is playing in the aerial rearmament of America. The congressmen roared down to Lindbergh field at 4:30 in three army transports and immediately went to the Consolidated aircratf plant to inspect the work being done there. Under guidance of Maj. Reuben Fleet, Consolidated head, they were shown the new army bomber, a four-motored craft whose capabilities are clothed in military secrecy, but which is said to have a speed greater than any large bombing craft in the world today.

FIRST PLANT VISITED

It was the first aircraft factory the congressmen had seen on their 8000-mile tour which began Nov. 9 at Washington and included a visit to every Central American country en route to Panama, where the vital canal link was studied, and thence back through Mexico and the southwest to San Diego.

They showed great interest in the fabrication of the army ship—all the congressmen are connected either with the house and senate military affairs committee or the house or senate subcommittees on appropriations for the army—and also in the construction of the famous navy PBY type craft, pioneered by the San Diego firm.

Afterward they were shown a motion picture of Consolidated operations which took in departments the visitors were unable to inspect because of time limitations.

In the evening they were guests of the city, county and chamber of commerce at Hotel del Coronado.

DREDGE WORK URGED

Advisability of immediate action to dredge an area adjacent to Ft. Rosecrans, to add 15 acres to the land available for coast defense works at an approximate cost of $80,000, was stresesd at the dinner by Maj. Gen. H. B. Fiske, U.S.A. ret. and members of the chamber of commerce military committee. Advisability of adequate anti-aircraft protection for the San Diego naval base, and for more modern artillery at Ft. Rosecrans also was impressed on the visitors.

Aboard the army transports when

Canal Lacks Air Defenses

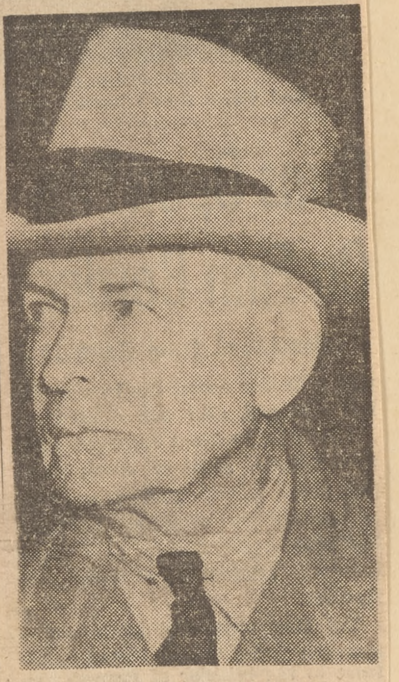
The Panama canal—vital link in the national defense picture is virtually defenseless from air attack, Sen Elmer Thomas (D-Okla), chairman of the senate subcommittee on war department appropriations, declared yesterday on his arrival with a congressional party which has been inspecting army outposts to the east and south.

"It seems to be adequately protected against sea or land attack," said the senator, as he paused on his arrival at Lindbergh field aboard an army transport plane. "But it has no adequate air defense. There are big guns there and army stations. Also there are a lot of planes. But I didn't see an anti-aircraft gun while I was there. The vital need, I would say, is for better anti-aircraft protection of the canal."

Sen. Thomas said the lack of anti-aircraft guns was apparent not only at the canal but everywhere the party has visited. Asked whether he would recommend additions of equipment along this line he said the purpose of the congressional party was to get a picture of the needs of the military establishment and it was the war department's business to make recommendations on necessary defense weapons.

Never before in history, the senator said, has a congressional com-

(Continued on Page A, Col. 8)



SEN. ELMER THOMAS
. . . "I haven't seen an anti-aircraft gun."

Canal Lacks Air Defenses

(Continued from Page 1)

mittee undertaken a more comprehensive check-up of national defense. Leaving Washington Nov. 9 in three army transports, the party, comprising members of four major committees—house and senate military affairs bodies, and house and senate subcommittees on war department appropriations—has traveled 8000 miles and still has 4000 to go before completing its journey at Washington about Dec. 15.

"Only in this manner can we familiarize ourselves with the points and conditions which the war department will outline in its requests for appropriations," he said. He emphasized that this was no congressional junket, as the solons often had to rise at 5 a.m. to make their schedule and spent long hours in the air.

11 Solons Arrive For Inspection Of S. D. Defenses

(Continued from Page 1)

they dropped to Lindbergh field were Sens. Elmer Thomas, Oklahoma; Sherman Minton, Indiana; Dennis Chavez, New Mexico and Harry S. Truman, Missouri; Reps. John Martin Costello, California; Overton Brooks, Louisiana; Charles Russell Clason, Massachusetts; Paul W. Shafer, Michigan; John J. Sparkman, Alabama, and Thomas Ellsworth Martin, Iowa.

TRIP UNPRECEDENTED

"Never before so far as I have heard have members of the four committees concerned with war department appropriations made a trip like this," said Sen. Elmer Thomas, who headed the party.

The committee's tour will include defense points up to the Canadian border, thence across the country to take in munitions, armament and aircraft factories, along with various military posts en route.

This morning the congressmen will inspect the Ryan and Solar aircraft plants and the army primary training school at the Ryan aeronautics division. The visitors are to leave at 9 a. m. for March field, Riverside, going thence to Los Angeles for a two-day inspection of air schools and aircraft factories before proceeding northward.

AIDS ACCOMPANY SOLONS

Accompanying the congressmen as military aids are Majs. Arthur R. Wilson of the war department general staff, who was largely instrumental in arranging the itinerary of the party, and John E. Upston, from the office of the chief of air corps.

Brig. Gen. Jacob E. Fickel, commanding the First Wing, army air corps G. H. Q., whose headquarters are at March field, flew here yesterday and greeted the vistiors. He will fly with them to March field this morning.

Gen. Fickel commands army air activities on the west coast, where there are three fields—March, Moffett and Hamilton—with another under construction at Tacoma.

Gen. Fickel reported that March field is in process of expansion which will add 600 men and 25 officers to the personnel. There are 110 planes there, while a modernizing program will call for 60 new pursuit craft and 30 bombers of the flying fortress type to replace some of the older equipment on hand.

Union 12-4-39

Plane Contract Expected Soon By Consolidated

Possibility that the Consolidated Aircraft Corp. may receive a $20,000,000 contract this week for construction of an undisclosed number of new long-range offshore patrol bombers, was expressed yesterday by Consolidated officials.

Maj. R. H. Fleet, president of the municipal airport plant, flew to Washington last week for final conference with naval authorities.

The navy department recently announced that Consilidated submitted the lowest bid for the construction of twin-motored bombers. Two hundred twenty-five of this type plane have been built at Consolidated for the navy since the factory was established here.

EXPANSION COSTLY

It is reported one of the chief obstacles in award of the contract is the insistence of Consolidated officials that the government stand the expense of constructing the new building in which the bombers would be built. The estimated cost is said to exceed $1,000,000. The factory is working to capacity on army and navy contracts.

The proposeod plant expansion would increase the present floor space by 92 percent. The building would be 400 by 900 feet.

NAVY ASKED TO PAY

Maj. Fleet contends the navy department should bear the greater part of the expense of the new factory as the building would not be used under normal manufacturing conditions in the aircraft industry.

More than $100,000,000 in contracts are being completed by southern California aircraft companies for the American and foreign governments. All these factories, except Consolidated, have expanded their facilities to meet the increasing demand for airplanes.

The proposed new factory at Lindbergh field would employ from 2000 to 3000 men but Consolidated officials point out at least six months would be required to construct the factory after the navy department has awarded the $20,000,000 contract.

office of the chief of the air corps.

Speaking last night at a city-county-chamber of commerce dinner at Hotel del Coronado, Thomas stressed military preparations "along reasonable lines" as the best assurance against the danger of war.

Responding to addresses which emphasized San Diego's need for more adequate defense facilities, Thomas declared:

"The United States must follow a program of reasonable preparedness. We have less than 1,000,000 men who could be called at once in event of emergency. Already, on this trip, I have been impressed with the lack of equipment available for the troops we do have and, from what I've been told, San Diego is no exception."

The visiting solons were impressed with the need for added military facilities here by Maj. Gen. H. B. Fiske, U.S.A., ret., vice chairman, chamber military affairs committee, and Rear Adm. Joseph R. Defrees, 11th naval district commandant.

"To provide our fleet with freedom at sea, it is of utmost importance that our shore bases be strongly fortified and adequately garrisoned at all times," said Fiske. "We must remember that important elements of the fleet are permanently based on shore and local defense should be enforced whether the fleet is here or elsewhere. It is the business of the army to provide this protection."

Seeks Added Dredging

Fiske urged creation of permanent military units here, in addition to installation of new long-range guns at Ft. Rosecrans. It was pointed out that the present guns at the fort are of 1890 vintage. Fiske advised immediate action to dredge an area adjacent to the fort, to add 15 acres to land available for coast defense works. This would cost about $80,000. The speaker also stressed necessity of adequate anti-aircraft protection for local naval bases.

Importance of the bay dredging project now under way was stressed by DeFrees, who pointed out that expansion of naval facilities, basing of additional vessels here and relief of the already crowded anchorage accommodations depend upon its completion.

"There are 24 ship bases here at present, although adequate anchorage facilities are not available," he stated. "There are seven 10,000-ton cruisers at Long Beach, which belong here but are not in this harbor because the dredging project is not completed."

DeFrees also mentioned the local navy shore establishments, which represent an investment of nearly $50,000,000.

Base for 60 More Ships

"Through the aid of the chamber of commerce, an assurance by the navy that other facilities are needed and cooperation by congress, some $18,000,000 has been obtained for improvements. Just last year, $6,800,000 was expended. But more improvements are needed. It is the plan of the navy to base 60 more ships here, a step which cannot be taken until harbor dredging is completed."

Maj. Gen. R. H. Van Deman, chamber military affairs committee chairman, who presided at the dinner, asserted that "in the past 22 years, the army has received virtually no increase in its material."

"Modern wars are fought with modern weapons," he said. "Without equipment and men, our army is not modern."

Responding to Van Deman's request that the visiting solons "use your influence to get congress to give the army what it needs," Costello, Hollywood representative, replied:

"We already have seen examples of how military bases have been left to ruin due to inadequate appropriations of funds. But we are witnessing a change today. The army as an important part of our national defense is being given serious consideration. The war department will be given added funds for needed expansion. I'm sure that the coats will get a badly-needed share of these funds."

Frank Forward, chamber president, introduced city and county representatives, including Herbert E. Fish, vice mayor, and T. LeRoy Richards, board of supervisors chairman. Col. Robert E. Guthrie, Ft. Rosecrans commander, introduced Brig. Gen. Jacob Fickel, commanding first air force, Marsh field.

The congressional party landed at Lindbergh field at 4:30 p.m., after inclement weather earlier in the day had threatened to delay their departure from Ft. Huachuca, Ariz., until today.

Consair Plant Visited

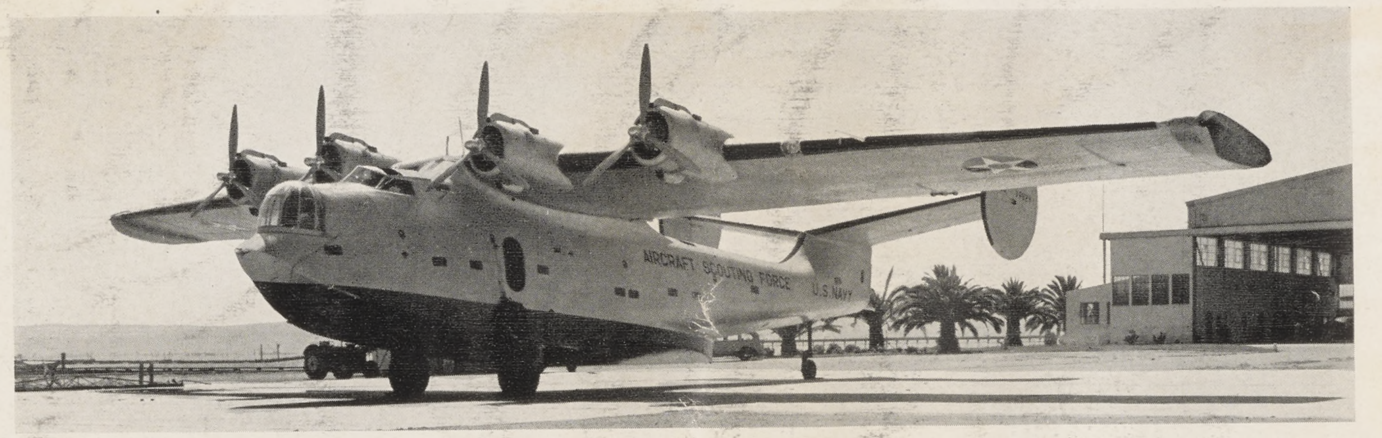
They went immediately to the Consolidated Aircraft Corp. plant, where, under guidance of Maj. Reuben Fleet, Consair head, they were shown the new four-motored army bomber under construction, which, it is said, will have a speed greater than that of any large bombing plane in the world.

It was the first airplane factory the solons had seen on their 8000-mile tour, which bagan Nov. 9 at Washington and included visits to Central American countries, the Canal Zone and Mexico.

The party planned to visit coast defense and aircraft manufacturing facilities as far north as the Canadian border. They were to be accompanied to March field by Fickel, who commands army air activities on the west coast. Fickel reported that March field is in process of adding 600 enlisted men and 25 officers to personnel. He said there are 110 planes there, while a modernizing program will add 60 new pursuit planes and 30 bombers of the "flying fortress" type to replace older equipment.

On arirving at Lindbergh field, Sen. Thomas pictured the Panama Canal as virtually defenseless from air attack. He said the vital inter-ocean link seemed to be adequately protected from sea and land attack by big guns and army stations, as well as numerous planes.

"But I didn't see an anti-aircraft gun while I was there," he said. "The vital need, I would say, is for vital anti-aircraft protection of the canal."



FIRST AIRPLANE TO BE OFFICIALLY RECOGNIZED AS A FLAGPLANE OF THE UNITED STATES NAVY

Consolidated XPB2Y Flying Boat Which on August 24 Carried the Flag of Admiral A. B. Cook, Commanding Aircraft Squadron of the Scouting Forces, thereby Establishing a Precedent in Naval History. Never Before has Such a Flag been Hoisted Officially on an Airplane. This Plane had been Flown to Seattle, Washington, by Navy Personnel Commanded by Comdr. Andrew Crinkley

Senate Votes Repeal of Arms Embargo

AFTER FIVE WEEKS OF DEBATE the Senate has finally voted, by 63 to 30, for repeal of the arms embargo, paving the way for similar action by the House which now has the proposal under consideration. Administration strategists in charge of the bill have set a course in the House designed to assure early favorable action, after which possible conferences between House and Senate, in event of any House changes, will coordinate the wishes of the two legislative bodies and an adjournment of the current special session will be in prospect.

Meanwhile embattled allied nations, facing constant threat of air devastation, were openly jubilant at the Senate's action, foreseeing that the almost unlimited industrial resources of the United States would soon be available to replace anticipated wastage of airplanes and perhaps to bolster their own lag in production compared with the German output of combat aviation.

The effect of the enforcement of embargo provisions, beginning on the outbreak of hostilities in Europe in September, has been apparent in suspension of further despatch of American-built combat planes for England and France, with accessory equipment, and the revocation of British licenses for such export of aviation primarily, totaling $14,877,086, and of French licenses aggregating $58,418,113, likewise principally for American aircraft and accessories. Altogether there were cancelled after September 5, the date of the neutrality ban, export licenses for shipment of American munitions abroad totaling $78,908,525.

As American factories, industries, and stores felt a sharp upswing in recent months, which may or may not be attributed to the effect of war activities abroad, there came again to the United States reports from abroad of impending airplane and aviation purchases of staggering dimensions, once the ban on such procurement is lifted by Congressional sanction. In the meantime, these premonitory reports continued in the face of the internationalization of a famous American commercial term—CASH AND CARRY.

Congress, while opening the way to the American storehouses, has attempted to safeguard American sellers, and American interests from compromise in war situations by making mandatory this homely provision of the cutrate grocery and the florist which enables the college youth to supply his sorority date on weekends with an orchid and still retain some cash for the movies.

Wright Awarded Large Order

A CONTRACT for the purchase of airplane engines amounting to $6,963,292 was awarded to Wright Aeronautical Corporation by the War Department on October 10th.

Two types of engines are included in the contract, as follows: A type designed as the R 1820-65 and rated at 1,000 h-p., designed for powering the Boeing flying fortresses B-17C; and the R 2600-9, rated at 1,500 h-p., designed for the new B-25 airplane, a two-engined mid-wing, all metal medium bomber, now being manufactured by the North American Aviation Corporation.

TWA Thanksgiving Menu

IN STRIKING CONTRAST to the rationing of foodstuffs now prevalent in European countries it is our happy privilege to print the following menu which has been evolved by TWA dieticians to be served on its airliners on November 23rd—Thanksgiving Day by presidential proclamation—and also on November 30th—the traditional date.

Strained Gumbo
Stuffed Celery — Crackers
Spiced Watermelon Rind
Roast Vermont Turkey — Oyster Sauce
(Chestnut Stuffing)
Hawaiian Sweet Potatoes
(Sweet Potato — Apple and
Pineapple Slices)
Corn and Tomatoes
Brown Nut Bread Parker House Roll
Butter
Apple—Celery—Raisin and Date Salad
(Mayonnaise)
Mince Pie — Swiss Cheese
Coffee Milk
Old-Fashioned After Dinner Mints

SAE Talks Production

With rapidly rising backlogs, the aircraft manufacturers are more interested than ever in production problems

By Charles F. McReynolds

WITH American aircraft production swinging into new high ground, the 1939 S.A.E. National Aircraft Production Meeting found a ready response among the aircraft people of the Pacific Coast. In line with recent record production rates of various aircraft plants, the papers presented at the various sessions established an enviable mark for exposition of detailed procedures such as are often considered "trade secrets" even within the ranks. As one interested listener remarked; "This has been a 'million-dollar' series of lectures." The attendance matched the merit of the papers, with 875 persons enrolling at the S.A.E. desk and that many more believed to have been in attendance but not registered.

Almost every session found the hall packed to the gills and a conservative estimate of total attendance for the three days would be in the neighborhood of three thousand persons.

Keynote of the current condition in our aviation industry was sounded by Brigadier General Jacob E. Fickel, March Field commander, who reported on the progress of the President's air expansion program, with the assurance that the industry has met every demand for increased production and is currently much farther along with the program than was at first thought possible. General Fickel concluded with the statement, "We . . . know that with the increased facilities and larger appropriations for research and experimentation now available, that this country will remain in the lead in advanced design, and will meet any challege for supremacy in the air." Gen. Fickel spoke in place of Louis Johnson, Assistant Secretary of War, who had originally been scheduled to come to Los Angeles to address the session. General Fickel was introduced by Robert E. Gross, president of the Lockheed Aircraft Corporation, who referred to present world conditions as "The one immortal hour of our lifetime . . . when the history of the world is being written not in the chancellories of nations, but on the drawing boards of aviation engineers." Gross reminded his hearers of the fact that commercial and military aviation have equally affected our lives, saying, "The airplane has made of nations a neighborhood; but it has made the world a battlefield."

Robert E. Gross, president Lockheed Aircraft Corp.

The meeting closed with a banquet and grand ball on Saturday evening at the Biltmore Hotel, home of the sessions. Some five hundred of aviation's leading personalities turned out for this social function, which was devoted entirely to banqueting and dancing, except for a brief speech of welcome by E. W. Templin, chairman of the Southern California Section of the S.A.E., hosts of the session.

This year an aircraft engineering exhibit was held in connection with the production meeting. Taking over a large hall adjoining the ballroom in which the sessions were held, a representative group of manufacturers displayed their products and found a responsive audience. Those exhibiting at the engineering show were: Aircraft Accessories Corp., samples of the hydraulic equipment manufactured, also equipment built by the Thos. L. Siebenthaler Division; Aircraft Precision Products, Inc., a very complete line of sample parts representing work done on a contract basis for the various aircraft plants; Aluminum Company of America, a large number of sample parts representing the latest work in aluminum casting, forging, welding, extrusions, etc.; Aluminum Industries, Inc., sample of Aluminum alloy castings; Bantam Bearings Corp., a complete line of aircraft bearings; Baldwin-Southwark Corp., a laboratory testing machine for determining strength of materials in either compression or tension; Bendix Products, a display of typical Bendix accessories as used throughout

The army as an important part of our national defense is being given serious consideration. The war department will be given added funds for needed expansion. I'm sure that the coats will get a badly-needed share of these funds."

Frank Forward, chamber president, introduced city and county representatives, including Herbert E. Fish, vice mayor, and T. LeRoy Richards, board of supervisors chairman. Col. Robert E. Guthrie, Ft. Rosecrans commander, introduced Brig. Gen. Jacob Fickel, commanding first air force, Marsh field.

The congressional party landed at Lindbergh field at 4:30 p.m., after inclement weather earlier in the day had threatened to delay their departure from Ft. Huachuca, Ariz., until today.

Consair Plant Visited

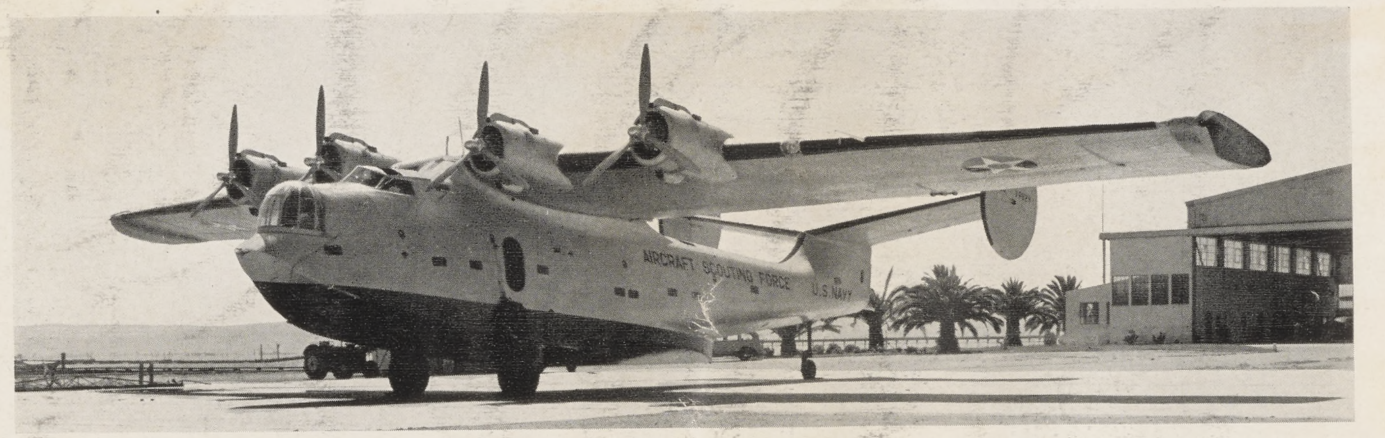
They went immediately to the Consolidated Aircraft Corp. plant, where, under guidance of Maj. Reuben Fleet, Consair head, they were shown the new four-motored army bomber under construction, which, it is said, will have a speed greater than that of any large bombing plane in the world.

It was the first airplane factory the solons had seen on their 8000-mile tour, which bagan Nov. 9 at Washington and included visits to Central American countries, the Canal Zone and Mexico.

The party planned to visit coast defense and aircraft manufacturing facilities as far north as the Canadian border. They were to be accompanied to March field by Fickel, who commands army air activities on the west coast. Fickel reported that March field is in process of adding 600 enlisted men and 25 officers to personnel. He said there are 110 planes there, while a modernizing program will add 60 new pursuit planes and 30 bombers of the "flying fortress" type to replace older equipment.

On arirving at Lindbergh field, Sen. Thomas pictured the Panama Canal as virtually defenseless from air attack. He said the vital inter-ocean link seemed to be adequately protected from sea and land attack by big guns and army stations, as well as numerous planes.

"But I didn't see an anti-aircraft gun while I was there," he said. "The vital need, I would say, is for vital anti-aircraft protection of the canal."



FIRST AIRPLANE TO BE OFFICIALLY RECOGNIZED AS A FLAGPLANE OF THE UNITED STATES NAVY

Consolidated XPB2Y Flying Boat Which on August 24 Carried the Flag of Admiral A. B. Cook, Commanding Aircraft Squadron of the Scouting Forces, thereby Establishing a Precedent in Naval History. Never Before has Such a Flag been Hoisted Officially on an Airplane. This Plane had been Flown to Seattle, Washington, by Navy Personnel Commanded by Comdr. Andrew Crinkley

Senate Votes Repeal of Arms Embargo

AFTER FIVE WEEKS OF DEBATE the Senate has finally voted, by 63 to 30, for repeal of the arms embargo, paving the way for similar action by the House which now has the proposal under consideration. Administration strategists in charge of the bill have set a course in the House designed to assure early favorable action, after which possible conferences between House and Senate, in event of any House changes, will coordinate the wishes of the two legislative bodies and an adjournment of the current special session will be in prospect.

Meanwhile embattled allied nations, facing constant threat of air devastation, were openly jubilant at the Senate's action, foreseeing that the almost unlimited industrial resources of the United States would soon be available to replace anticipated wastage of airplanes and perhaps to bolster their own lag in production compared with the German output of combat aviation.

The effect of the enforcement of embargo provisions, beginning on the outbreak of hostilities in Europe in September, has been apparent in suspension of further despatch of American-built combat planes for England and France, with accessory equipment, and the revocation of British licenses for such export of aviation primarily, totaling $14,877,086, and of French licenses aggregating $58,418,113, likewise principally for American aircraft and accessories. Altogether there were cancelled after September 5, the date of the neutrality ban, export licenses for shipment of American munitions abroad totaling $78,908,525.

As American factories, industries, and stores felt a sharp upswing in recent months, which may or may not be attributed to the effect of war activities abroad, there came again to the United States reports from abroad of impending airplane and aviation purchases of staggering dimensions, once the ban on such procurement is lifted by Congressional sanction. In the meantime, these premonitory reports continued in the face of the internationalization of a famous American commercial term—CASH AND CARRY.

Congress, while opening the way to the American storehouses, has attempted to safeguard American sellers, and American interests from compromise in war situations by making mandatory this homely provision of the cutrate grocery and the florist which enables the college youth to supply his sorority date on weekends with an orchid and still retain some cash for the movies.

✣ ✣

Wright Awarded Large Order

A CONTRACT for the purchase of airplane engines amounting to $6,963,292 was awarded to Wright Aeronautical Corporation by the War Department on October 10th.

Two types of engines are included in the contract, as follows: A type designed as the R 1820-65 and rated at 1,000 h-p., designed for powering the Boeing flying fortresses B-17C; and the R 2600-9, rated at 1,500 h-p., designed for the new B-25 airplane, a two-engined mid-wing, all metal medium bomber, now being manufactured by the North American Aviation Corporation.

A Production Expert Expresses His Views On

Planning for PRODUCTION

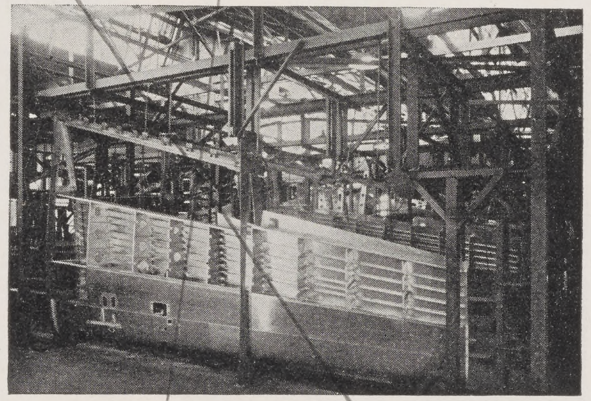
Being an excerpt from a paper entitled "Accelerated Aircraft Production for National Defense"* by

P. N. Jansen

Factory Manager, Curtiss Airplane Division, Buffalo, N. Y.

WITH the transition from stick and wire design to present day construction comes the need for a different approach to the manufacturing and organization lineup. Practically all parts normally manufactured by airplane companies receive their primary operation in three manufacturing groups, namely shearing, press and machine shop. Nearly all parts require tools, even in small quantities. This reflects back in many ways and I believe that recognition of fundamentals in these changes will tend to work an easier solution.

Geographic location of activities is more important and should be recognized in plant layout. Organization and the human element are of extreme importance. Before, the line and staff organization prevailed and gave us satisfactory results, but we are now blending into the truly functional type of organization. This provides for the specialist and when properly carried out will present a great aid to rapid expansion. Whereas in the past the average first-class man used to make his own templates and layouts, this is now concentrated in a loft or layout department. Where we used to mix fabricating with assembly, there is now a strict separation with all groups carefully departmentalized. Shop orders are augmented by operation sheets with the ultimate aim of supplying operators with accurate information, tools and materials. All this has deep significance. It shortens the training period at least for the vast majority of workmen because the application of knowledge and skill is confined. The advantages for national defense are far reaching. However there are dangers and possible drawbacks. Weakness in any group can do great harm and the existence of incapable management which does not fully grasp the fundamentals or fails to recognize the need for close coordination, will cause confusion. We still need skilled tradesmen in the aircraft industry but the training problem is easier because of specialization. With some trained men in all positions, as outlined before, many young men with high school education can become fairly proficient in repetitive operations, drilling, riveting, in short time.



The main assembly fixture on which the wing is completed and then removed. There are numerous additional assembly tools not shown here. All assembly jigs are designed so that they do not require dismantling for removal of units. They are made with removable parts and are hinged and chained to avoid losses.

The Human Element

The human element offers its problem and it is essentially a moral obligation to recognize the effect on personnel that arises with the introduction of a new order. An operator, especially one on minor operations, does not feel as secure because he can readily be replaced. The more specialization, the more demand for seniority rules and the rate question has been similarly affected. Men with years of experience and service may do the same repetition job, sometimes not as well, as a youngster with six months' experience. The older man may at

a congressional military affairs party, who arrived here yesterday to inspect sea, shore and air establishments and airplane factories.

The party concluded its inspection this morning with a visit to Ryan Aircraft Co. and Solar Aircraft Co. plants, and left for March field, Riverside, and the Los Angeles district.

The group, traveling in three giant army transport planes, is on one of the most comprehensive tours of the nation's defenses by any congressional party in history. In the party here were Sens. Elmer Thomas (D-Okla), chairman, senate subcommittee on army appropriations; Harry S. Truman (D-Mo), army appropriations subcommittee member; Sherman Minton (D-Ind), senate military affairs committee member, and Dennis Chavez (D-NM), and Reps. John M. Costello (D-Calif), Overton Brooks (D-La), Charles R. Glason (R-Mass), Paul W. Shafer (R-Mich), John J. Sparkman (D-Ala), and Thomas E. Martin (R-Ia), all of the house military affairs committee.

Accompanying the solons as military aids were Majs. Arthur R. Wilson, of the war department general staff, and John E. Upston, from the

office of the chief of the air corps.

Speaking last night at a city-county-chamber of commerce dinner at Hotel del Coronado, Thomas stressed military preparations "along reasonable lines" as the best assurance against the danger of war.

Responding to addresses which emphasized San Diego's need for more adequate defense facilities, Thomas declared:

"The United States must follow a program of reasonable preparedness. We have less than 1,000,000 men who could be called at once in event of emergency. Already, on this trip, I have been impressed with the lack of equipment available for the troops we do have and, from what I've been told, San Diego is no exception."

The visiting solons were impressed with the need for added military facilities here by Maj. Gen. H. B. Fiske, U.S.A., ret., vice chairman, chamber military affairs committee, and Rear Adm. Joseph R. Defrees, 11th naval district commandant.

"To provide our fleet with freedom at sea, it is of utmost importance that our shore bases be strongly fortified and adequately garrisoned at all times," said Fiske. "We must remember that important elements of the fleet are permanently based on shore and local defense should be enforced whether the fleet is here or elsewhere. It is the business of the army to provide this protection."

Seeks Added Dredging

Fiske urged creation of permanent military units here, in addition to installation of new long-range guns at Ft. Rosecrans. It was pointed out that the present guns at the fort are of 1890 vintage. Fiske advised immediate action to dredge an area adjacent to the fort, to add 15 acres to land available for coast defense works. This would cost about $80,000. The speaker also stressed necessity of adequate anti-aircraft protection for local naval bases.

Importance of the bay dredging project now under way was stressed by DeFrees, who pointed out that expansion of naval facilities, basing of additional vessels here and relief of the already crowded anchorage accommodations depend upon its completion.

"There are 24 ship bases here at present, although adequate anchorage facilities are not available," he stated. "There are seven 10,000-ton cruisers at Long Beach, which belong here but are not in this harbor because the dredging project is not completed."

DeFrees also mentioned the local navy shore establishments, which represent an investment of nearly $50,000,000.

Base for 60 More Ships

"Through the aid of the chamber of commerce, an assurance by the navy that other facilities are needed and cooperation by congress, some $18,000,000 has been obtained for improvements. Just last year, $6,800,000 was expended. But more improvements are needed. It is the plan of the navy to base 60 more ships here, a step which cannot be taken until harbor dredging is completed."

Maj. Gen. R. H. Van Deman, chamber military affairs committee chairman, who presided at the dinner, asserted that "in the past 22 years, the army has received virtually no increase in its material."

"Modern wars are fought with modern weapons," he said. "Without equipment and men, our army is not modern."

Responding to Van Deman's request that the visiting solons "use your influence to get congress to give the army what it needs," Costello, Hollywood representative, replied:

"We already have seen examples of how military bases have been left to ruin due to inadequate appropriations of funds. But we are witnessing a change today. The army as an important part of our national defense is being given serious consideration. The war department will be given added funds for needed expansion. I'm sure that the coats will get a badly-needed share of these funds."

Frank Forward, chamber president, introduced city and county representatives, including Herbert E. Fish, vice mayor, and T. LeRoy Richards, board of supervisors chairman. Col. Robert E. Guthrie, Ft. Rosecrans commander, introduced Brig. Gen. Jacob Fickel, commanding first air force, Marsh field.

The congressional party landed at Lindbergh field at 4:30 p.m., after inclement weather earlier in the day had threatened to delay their departure from Ft. Huachuca, Ariz., until today.

the aircraft industry; Ed. G. Budd Mfg. Co., stainless steel parts and accessories; Cannon Electric Development Co., quick-detachable multi-circuit connector plugs; Ducommun Metals and Supply Co., aircraft hardware; Fafnir Bearing Co., a complete line of aircraft bearings; International Nickel Co., stainless steel; Librascope, Inc., balance and power computers; Edw. D. Maltby Co., Federal aircraft bearings; Norma-Hoffman Bearings Corp., aircraft bearings; Pyrene Mfg. Co., fire extinguishers; Rohm & Haas Co., Inc., Plexiglas in various forms; S.A.E., membership display; Solar Aircraft Co., exhaust manifolds, steam heating system; SKF Industries Inc., aircraft bearings; United Aircraft Products, Inc., parts; Wright Aeronautical Corp., engine display. J. H. Kindelberger, president of North American Aviation, Inc., acted as chairman of the aircraft engineering display committee.

General chairman for this year's production meeting was Mac Short, president of Vega Airplane Company. Short was long on attention to details and the sessions went through without a hitch. In addition to the general excellence of the papers, and their extreme timeliness from a production standpoint, was the unusual extent to which the sessions were illustrated. In addition to the customary slides the audiences were treated to a number of fine industrial moving pictures, some of which were presented with sound.

Dr. A. L. Klein, California Institute of Technology, was chairman of the first session, on Thursday morning, which got away to a flying start with the paper on Propeller Production, given by Arvid Nelson, Hamilton Standard Propellers. Nelson took his hearers through the development of propeller manufacture from the hand methods originally used to the present extensive machine methods which have resulted in a vastly improved product at reduced cost. He discussed in detail the latest methods of shaping, broaching, milling, etc., as developed by Hamilton Standard. This talk was illustrated both with slides and with motion pictures. While Nelson's paper dealt with propeller manufacture, most of the machine processes he outlined could find application in many other phases of aircraft and aircraft engine production. For example Nelson showed how turret lathe work had been speeded up by using a color system to identify each tool with the toolholder. An example of reduction in machine time was given with a slotting operation performed on a vertical shaper in half the time previously used on a horizontal mill. Much of the growth of Hamilton Standard, and its present important position in the field of propeller development and production, should be credited to the intensive development of machine manufacturing methods, Nelson said. He pointed to the growth of the company from 25,000 sq. ft. of floor space to more than ten times that amount, and from 65 employees to the present total of more than 1200, as evidence that efficient machine methods create jobs. So comprehensively was this subject treated that no discussion was evoked.

AIRCRAFT ACCESSORIES CORP.
Glendale Calif.

S. A. E. engineering exhibit showing crowd interest in hydraulic display board of Aircraft Accessories Corp.

Not so, however, with the paper on Airplane Brake Installation and Control Considerations, by Henry H. Kerr and F. C. Frank, of the Bendix Products Div., Bendix Aviation Corp., read by Kerr. This paper dealt with the phases of brake design most closely concerned with proper control, and with service difficulties. Factors such as axle stiffness, play between the brake and landing gear, the two types of hydraulic fluid, proper sealing members, hose sizes, etc. were all discussed in detail, with reference to mathematical formulas that had been found satisfactory as a guide in designing brake systems. Several questioners popped up from the audience at the first opportunity to ask about the effect of drum irregularities, what portion of the coefficient of friction of the tires could be used, etc. Kerr replied that it was desirable to cool the drums as much as possible to avoid the results of overheating caused by irregularities, and other factors. He thought danger of nosing over through full application of brakes depended entirely upon the particular conditions and the individual airplane, pointing out that wheels may be slid with brakes fully locked under various conditions, as on a surface made slippery by water, or at the first part of the landing run when much of the plane's weight is still borne by the wings. Dr. Klein suggested that axles threw a heavy load on the wheels themselves if axle deflection occurs. Kerr felt that wheels lend themselves well to such stresses and knew of no cases where bearing failures had occured as a result. C. E. Stryker reported that total deflection of the DC5 axle was 1½ deg., including such deflection as takes place in the strut.

A prophetic discussion of "high pressure" hydraulic systems was presented by Harold W. Adams, Douglas Aircraft Company. Defining a "high pressure" system as one employing pressures above 2000 lb. per sq. in., Adams found many advantages for such a system, especially on large aircraft, and felt that the high pressure type hydraulic system would find wide adoption. Chief result of the use of a properly designed high pressure system is to effect a substantial weight saving. Also, the lines and fittings are smaller and easier to install and service. Machine work must be more accurately done, but this is made easier by the heavier sections employed, with the result that costs of machining about balance for both systems. Danger of high pressure systems was felt to be little greater in the event of failure, as parts are smaller and would have less inertia if thrown through the structure. The author felt that the problems of high pressure systems are primarily design problems, which stay solved, rather than shop problems, which are always with us. In a prepared discussion by J. W. White, chief engineer, brake

More BOEING CLIPPERS!

FOR THE GREATER
PAN AMERICAN SYSTEM

•

Only four months ago the dream of regularly scheduled transatlantic air passenger service became a reality. With the introduction of the big Boeing 314 Clippers and the materialization of Pan American Airways' carefully-laid plans, the North Atlantic at once became a standard commercial air route. Service over this route is now being carried on as a routine operation.

The recent order for a fleet of six additional Boeing 314's to increase schedules on both the Atlantic and the Pacific, expresses far better than words the traveling public's acceptance of these ships and of the Greater Pan American Service.

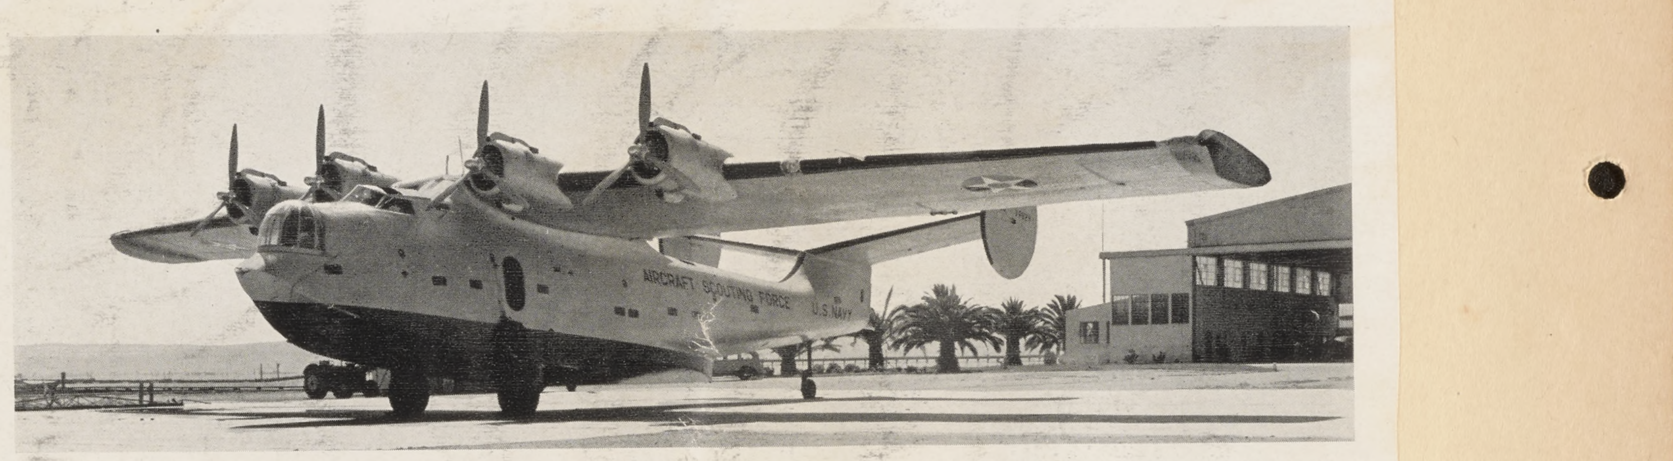
Fickel reported that March field is in process of adding 600 enlisted men and 25 officers to personnel. He said there are 110 planes there, while a modernizing program will add 60 new pursuit planes and 30 bombers of the "flying fortress" type to replace older equipment.

On arirving at Lindbergh field, Sen. Thomas pictured the Panama Canal as virtually defenseless from air attack. He said the vital inter-ocean link seemed to be adequately protected from sea and land attack by big guns and army stations, as well as numerous planes.

"But I didn't see an anti-aircraft gun while I was there," he said. "The vital need, I would say, is for vital anti-aircraft protection of the canal."



FIRST AIRPLANE TO BE OFFICIALLY RECOGNIZED AS A FLAGPLANE OF THE UNITED STATES NAVY

Consolidated XPB2Y Flying Boat Which on August 24 Carried the Flag of Admiral A. B. Cook, Commanding Aircraft Squadron of the Scouting Forces, thereby Establishing a Precedent in Naval History. Never Before has Such a Flag been Hoisted Officially on an Airplane. This Plane had been Flown to Seattle, Washington, by Navy Personnel Commanded by Comdr. Andrew Crinkley

Senate Votes Repeal of Arms Embargo

AFTER FIVE WEEKS OF DEBATE the Senate has finally voted, by 63 to 30, for repeal of the arms embargo, paving the way for similar action by the House which now has the proposal under consideration. Administration strategists in charge of the bill have set a course in the House designed to assure early favorable action, after which possible conferences between House and Senate, in event of any House changes, will coordinate the wishes of the two legislative bodies and an adjournment of the current special session will be in prospect.

Meanwhile embattled allied nations, facing constant threat of air devastation, were openly jubilant at the Senate's action, foreseeing that the almost unlimited industrial resources of the United States would soon be available to replace anticipated wastage of airplanes and perhaps to bolster their own lag in production compared with the German output of combat aviation.

The effect of the enforcement of embargo provisions, beginning on the outbreak of hostilities in Europe in September, has been apparent in suspension of further despatch of American-built combat planes for England and France, with accessory equipment, and the revocation of British licenses for such export of aviation primarily, totaling $14,877,086, and of French licenses aggregating $58,418,113, likewise principally for American aircraft and accessories. Altogether there were cancelled after September 5, the date of the neutrality ban, export licenses for shipment of American munitions abroad totaling $78,908,525.

As American factories, industries, and stores felt a sharp upswing in recent months, which may or may not be attributed to the effect of war activities abroad, there came again to the United States reports from abroad of impending airplane and aviation purchases of staggering dimensions, once the ban on such procurement is lifted by Congressional sanction. In the meantime, these premonitory reports continued in the face of the internationalization of a famous American commercial term—CASH AND CARRY.

Congress, while opening the way to the American storehouses, has attempted to safeguard American sellers, and American interests from compromise in war situations by making mandatory this homely provision of the cutrate grocery and the florist which enables the college youth to supply his sorority date on weekends with an orchid and still retain some cash for the movies.

Wright Awarded Large Order

A CONTRACT for the purchase of airplane engines amounting to $6,963,292 was awarded to Wright Aeronautical Corporation by the War Department on October 10th.

Two types of engines are included in the contract, as follows: A type designed as the R 1820-65 and rated at 1,000 h-p., designed for powering the Boeing flying fortresses B-17C; and the R 2600-9, rated at 1,500 h-p., designed for the new B-25 airplane, a two-engined mid-wing, all metal medium bomber, now being manufactured by the North American Aviation Corporation.

and hydraulics division, Bendix Products Division, problems of a suitable pump for high pressure systems were discussed in detail. Adams agreed that the pump is a real problem and thought it would be solved by a pump of positive displacement somewhat similar to Diesel fuel pumps. Considerable discussion came from the floor with respect to possible advantages of the high pressure system. Adams pointed to a saving of approximately 600 lb. through use of a high pressure hydraulic system on the Douglas DC4 as compared with best design practise on a suitable system using standard pressures.

C. E. Stryker, chief engineer, Bendix Company of Calif., acted as chairman for the Thursday afternoon session. Opening paper by Courtney Hertel, Douglas Aircraft Company, dealt with "Interchangeability in Modern Aircraft Production". This subject was treated primarily from the standpoint of large structural parts, such as portions of the wings and fuselage, and the problem of transferring dimensions from the loft boards to the production line in such a way that accessories and other units may be fitted to the parts of the plane where they mount, without additional fitting on the spot. Since no two men will scale the same exact dimension from a loft drawing it is necessary to use the loft layouts just once, for the development of a set of mathematical tables representing points at percentage lines of wing and fuselage. These tables of coordinates are thereafter used by all branches of the shop for developing jigs, fixtures, etc. Extensive use of the hydraulic press in securing uniform production and full inter-changeability was outlined.

Production came into its own in the discussion of The Final Assembly of Aircraft, given by H. F. Schwedes, North American Aviation, Inc. Schwedes spoke entirely from a series of slides showing pertinent portions of the North American factory. He pointed out that North American holds a peacetime production record for any major aircraft builder by turning out 103 complete airplanes during 23 working days of the month of August, and by averaging 74 airplanes per month for the first six months of 1939. Schwedes also disclosed that North American had assembled ten airplanes during one 24 hr. period recently. Primary factor in securing efficient production, Schwedes said, was for the engineering department to be production minded. This has been accomplished at North American through a remarkable degree of cooperation between the design section and the shop supervisors. Major factor in accomplishing large scale aircraft production, the author felt, was to break the production unit up into the maximum possible number of parts or subassemblies. This permits all primary work to be done without crowding, and, if proper jigs are used, the final assembly line then becomes a simple procedure of attaching completed units to the plane as it progresses along the floor. Much credit for North American's smooth production must go to the detailed production control system. This is based on a lot system by which contracts are broken up into units releasing 20 airplanes at a time, except for the first trial lot, which is usually for five to ten airplanes to permit the shop to check all tools, jigs, etc., prior to heavy production.

P. N. Jansen's paper on "Accelerated Aircraft Production for National Defense", (Reproduced in part on page 34) was read by T. P. Wright in the absence of the author. Wright did not read the entire paper, but commented on it generally. He felt that great emphasis should be placed on production of the prototype under pressure, as suggested by Jansen. He also thought that the mock-up idea could be further extended into preliminary design and production phases. Written discussion submitted by Ralph Damon, American Airlines, emphasized need of further attention to inventory control. Damon thought that aircraft factories keep too much of their financial reserves tied up in inventory; that inventory turn-over should be not less than twelve times a year, instead of two to four as at present. Discussion from the floor elicited the comment from Dr. A. L. Klein that installation of equipment in a plane is a much greater production problem than constructing the basic structure. For this reason Klein thought that emphasis on simplified structures, such as molded planes, may prove to be misguided due to the resulting problems of accessory installation.

FEDERAL
AIRCRAFT BEARINGS

Display of Federal Aircraft Bearings installed by E. D. Maltby Co., Calif. distributors. L. to R.—Fred C. Warren, E. D. Maltby, George A. Banton.

The development phase of production received attention at the Thursday evening session, with T. P. Wright acting as chairman. W. A. Hite, Vultee Aircraft, gave his paper on "Engineering Experimental Aircraft", in which he disclosed that the new Vultee Trainer, which has been ordered in quantity by the U. S. Army Air Corps, was flown exactly 88 days after the first engineering work commenced. Hite emphasized that production engineering did not suffer from this speed of development, as the plane was also laid out for the simplest possible production procedure. In this connection every effort was made to obtain shop suggestions prior to and during the course of design work. Indicative of the astonishing structural simplification in the Vultee Trainer is the fact that all spanwise wing stringers, or stiffeners have been eliminated, and that aileron, flap, and control surface ribs have been eliminated. Control surface ribs are eliminated through use of formed flat sheet with stiffness obtained by beads and flanges, the unit being fabric covered. The chairman questioned simplified engineering of the prototype, feeling that it might result in slower translation of the design into production. Hite said this problem had been solved through the close coordination of shop and engineering department at the time the prototype was being developed. It was also found economical to use the drop hammer extensively during experimental work.

Hearers began to feel happier about America's position in the field of military aircraft development after hearing Hite's explanation of how Vultee developed the trainer model in less than three months, and this feeling was clinched when B. W. Sheahan, of Consolidated Aircraft Corp., told how Consolidated developed the Model 31 in less than ten months, an

FOR LASTING SATISFACTION BUY A LUSCOMBE

Durable ALL METAL construction, using preformed and predrilled parts, makes possible a safe sturdy plane which will outlast conventional types. Because of its light weight and beautiful lines a Luscombe gives highest performance—104 cruising, 350 mile range, 900 feet-a-minute climb. Extra refinements at no additional cost such as ball bearing controls, rich upholstery, low nose for exceptional visibility, and two wide doors, afford greatest comfort and give the owner a feeling of luxury found only in ships priced remotely higher.

For greatest value, performance, and lasting satisfaction, your best buy is an ALL METAL Luscombe. Priced from $1895, with terms as low as $633 down. See and fly one now, there is a dealer near you.

LUSCOMBE 50—$1895; 65—$1975, SEAPLANE—$3170

THE TRIBUNE-SUN, San Diego, C

Members of Congress Military Inspection Party

11-29-39

Five members of a congressional military inspection party, with Brig. Gen. J. E. Fickel, west coast air chief, are shown as they arrived here yesterday to inspect local navy and military establishments. They are, left to right, Sen. Harry S. Truman, Rep. Paul W. Shafer, Sen. Sherman Minton, Sen. Dennis Chavez, Sen. Elmer Thomas. The party left today for March field and Los Angeles.

Further S. D. Defenses Held Vital By Eleven Visiting Congressmen

Trib. Sun 11-29-39

First-hand information on the vital need for expansion of local naval and military defense facilities was gleaned by 11 members of a congressional military affairs party, who arrived here yesterday to inspect sea, shore and air establishments and airplane factories.

(Picture on Page 13-A)

The party concluded its inspection this morning with a visit to Ryan Aircraft Co. and Solar Aircraft Co. plants, and left for March field, Riverside, and the Los Angeles district.

The group, traveling in three giant army transport planes, is on one of the most comprehensive tours of the nation's defenses by any congressional party in history. In the party here were Sens. Elmer Thomas (D-Okla), chairman, senate subcommittee on army appropriations; Harry S. Truman (D-Mo), army appropriations subcommittee member; Sherman Minton (D-Ind), senate military affairs committee member, and Dennis Chavez (D-NM), and Reps. John M. Costello (D-Calif), Overton Brooks (D-La), Charles R. Glason (R-Mass), Paul W. Shafer (R-Mich), John J. Sparkman (D-Ala), and Thomas E. Martin (R-Ia), all of the house military affairs committee.

Accompanying the solons as military aids were Majs. Arthur R. Wilson, of the war department general staff, and John E. Upston, from the

Urge Increase In San Diego Defenses

Trib-Sun 11-29-39

CONTINUED FROM PAGE ONE

office of the chief of the air corps.

Speaking last night at a city-county-chamber of commerce dinner at Hotel del Coronado, Thomas stressed military preparations "along reasonable lines" as the best assurance against the danger of war.

Responding to addresses which emphasized San Diego's need for more adequate defense facilities, Thomas declared:

"The United States must follow a program of reasonable preparedness. We have less than 1,000,000 men who could be called at once in event of emergency. Already, on this trip, I have been impressed with the lack of equipment available for the troops we do have and, from what I've been told, San Diego is no exception."

The visiting solons were impressed with the need for added military facilities here by Maj. Gen. H. B. Fiske, U.S.A., ret., vice chairman, chamber military affairs committee, and Rear Adm. Joseph R. Defrees, 11th naval district commandant.

"To provide our fleet with freedom at sea, it is of utmost importance that our shore bases be strongly fortified and adequately garrisoned at all times," said Fiske. "We must remember that important elements of the fleet are permanently based on shore and local defense should be enforced whether the fleet is here or elsewhere. It is the business of the army to provide this protection."

Seeks Added Dredging

Fiske urged creation of permanent military units here, in addition to installation of new long-range guns at Ft. Rosecrans. It was pointed out that the present guns at the fort are of 1890 vintage. Fiske advised immediate action to dredge an area adjacent to the fort, to add 15 acres to land available for coast defense works. This would cost about $80,000. The speaker also stressed necessity of adequate anti-aircraft protection for local naval bases.

Importance of the bay dredging project now under way was stressed by DeFrees, who pointed out that expansion of naval facilities, basing of additional vessels here and relief of the already crowded anchorage accommodations depend upon its completion.

"There are 24 ship bases here at present, although adequate anchorage facilities are not available," he stated. "There are seven 10,000-ton cruisers at Long Beach, which belong here but are not in this harbor because the dredging project is not completed."

DeFrees also mentioned the local navy shore establishments, which represent an investment of nearly $50,000,000.

Base for 60 More Ships

"Through the aid of the chamber of commerce, an assurance by the navy that other facilities are needed and cooperation by congress, some $18,000,000 has been obtained for improvements. Just last year, $6,800,000 was expended. But more improvements are needed. It is the plan of the navy to base 60 more ships here, a step which cannot be taken until harbor dredging is completed."

Maj. Gen. R. H. Van Deman, chamber military affairs committee chairman, who presided at the dinner, asserted that "in the past 22 years, the army has received virtually no increase in its material."

"Modern wars are fought with modern weapons," he said. "Without equipment and men, our army is not modern."

Responding to Van Deman's request that the visiting solons "use your influence to get congress to give the army what it needs," Costello, Hollywood representative, replied:

"We already have seen examples of how military bases have been left to ruin due to inadequate appropriations of funds. But we are witnessing a change today. The army as an important part of our national defense is being given serious consideration. The war department will be given added funds for needed expansion. I'm sure that the coats will get a badly-needed share of these funds."

Frank Forward, chamber president, introduced city and county representatives, including Herbert E. Fish, vice mayor, and T. LeRoy Richards, board of supervisors chairman. Col. Robert E. Guthrie, Ft. Rosecrans commander, introduced Brig. Gen. Jacob Fickel, commanding first air force, Marsh field.

The congressional party landed at Lindbergh field at 4:30 p.m., after inclement weather earlier in the day had threatened to delay their departure from Ft. Huachuca, Ariz., until today.

Consair Plant Visited

They went immediately to the Consolidated Aircraft Corp. plant, where, under guidance of Maj. Reuben Fleet, Consair head, they were shown the new four-motored army bomber under construction, which, it is said, will have a speed greater than that of any large bombing plane in the world.

It was the first airplane factory the solons had seen on their 8000-mile tour, which bagan Nov. 9 at Washington and included visits to Central American countries, the Canal Zone and Mexico.

The party planned to visit coast defense and aircraft manufacturing facilities as far north as the Canadian border. They were to be accompanied to March field by Fickel, who commands army air activities on the west coast. Fickel reported that March field is in process of adding 600 enlisted men and 25 officers to personnel. He said there are 110 planes there, while a modernizing program will add 60 new pursuit planes and 30 bombers of the "flying fortress" type to replace older equipment.

On arirving at Lindbergh field, Sen. Thomas pictured the Panama Canal as virtually defenseless from air attack. He said the vital inter-ocean link seemed to be adequately protected from sea and land attack by big guns and army stations, as well as numerous planes.

"But I didn't see an anti-aircraft gun while I was there," he said. "The vital need, I would say, is for vital anti-aircraft protection of the canal."

Senate Votes Repeal of Arms Embargo

AFTER FIVE WEEKS OF DEBATE the Senate has finally voted, by 63 to 30, for repeal of the arms embargo, paving the way for similar action by the House which now has the proposal under consideration. Administration strategists in charge of the bill have set a course in the House designed to assure early favorable action, after which possible conferences between House and Senate, in event of any House changes, will coordinate the wishes of the two legislative bodies and an adjournment of the current special session will be in prospect.

Meanwhile embattled allied nations, facing constant threat of air devastation, were openly jubilant at the Senate's action, foreseeing that the almost unlimited industrial resources of the United States would soon be available to replace anticipated wastage of airplanes and perhaps to bolster their own lag in production compared with the German output of combat aviation.

The effect of the enforcement of embargo provisions, beginning on the outbreak of hostilities in Europe in September, has been apparent in suspension of further despatch of American-built combat planes for England and France, with accessory equipment, and the revocation of British licenses for such export of aviation primarily, totaling $14,877,086, and of French licenses aggregating $58,418,113, likewise principally for American aircraft and accessories. Altogether there were cancelled after September 5, the date of the neutrality ban, export licenses for shipment of American munitions abroad totaling $78,908,525.

As American factories, industries, and stores felt a sharp upswing in recent months, which may or may not be attributed to the effect of war activities abroad, there came again to the United States reports from abroad of impending airplane and aviation purchases of staggering dimensions, once the ban on such procurement is lifted by Congressional sanction. In the meantime, these premonitory reports continued in the face of the internationalization of a famous American commercial term—CASH AND CARRY.

Congress, while opening the way to the American storehouses, has attempted to safeguard American sellers, and American interests from compromise in war situations by making mandatory this homely provision of the cutrate grocery and the florist which enables the college youth to supply his sorority date on weekends with an orchid and still retain some cash for the movies.

S.A.E. Talks Production

(*Continued from page 86*)

astonishing record for such a huge plane. The Model 31 is a twin-engined flying boat powered with two of the new Wright Duplex Cyclone engines of 2000 h.p., and is generally credited with an all-out range of about 10,000 miles and a top speed in the neighborhood of 300 m.p.h. The plane was built at the expense of the Consolidated company as a private project which might be converted to either commercial or military specifications. Therefore the problem of accessories and equipment installations was given little consideration in early stages of the design, every effort being made to get the airplane in the air as a flying unit. However, accessory problems were not neglected, but were carried forward concurrently with the airplane design proper. A major speed-up resulted from working directly off drawing boards. Drawings were cut to about one-third the normal number and all working drawings were laid out directly on loft boards which were then, in most cases, transferred directly to the shop for use as jigs and templates. Photographs of the loft layouts serve as permanent records, and for reference purposes of all sorts.

A detailed progress report on the development of in-line, aircooled engines was given by A. T. Gregory, chief engineer, Ranger Engineering Corp., showing that the Ranger six-cylinder engine has been developed to give 50 per cent greater horsepower within the past five years, with equivalent reduction in weight per horsepower. It was shown that manifold design depends on a careful study of the harmonics of pressure waves within the intake manifold, a proper selection of length and diameter resulting in a supercharging affect. A detailed report on valve gear and camshaft development was also made. An indefinite life for all valve gear parts except the spring has now been achieved, practically through application of needle bearings to the rocker arms. Extensive experiment and mathematical analysis has made it possible to locate the critical speed of camshaft vibration outside the operating speed range of the engine, with consequent improvement in service life of valve gear and drive.

Major problem in the quantity production of aircraft engines is the proportionately high number of changes made during production, an average of 10 changes for every 18 engines produced. Origin and nature of such changes was discussed, with the conclusion that more benefit results from speeding up the design change process than from trying to choke it down. Several outstanding recent design changes were described, such as the oil scavenging annulus which has been incorporated in the front and rear walls of the Cyclone G.200 crankcase resulting in a higher rate of oil flow with better scavenging. Progress in the design of a forged steel crankcase was outlined. The present case is as light, and as cheap to manufacture, as the alloy case it has displaced, and has proved much more satisfactory in service. An astonishing development is the reversal of the piston skirt oil scraper ring, making it a "pumper". Result is better lubrication of the cylinder walls. Precautions to prevent oil getting past the upper rings has actually reduced oil consumption. Other design changes were noted, such as the spikes forged on the under side of the piston head for cooling, the coil spring piston pin retainers, the new end sealed master rod bearing which improves oil flow through the rod system, and the new automatic self-cleaning oil filter.

A report by O. C. Bridgeman on the C.F.R. Vapor Lock Project, indicated that vapor lock, while not a problem at normal operating altitudes of 5–10,000 ft., becomes a very real problem at 20,000 ft. or more, and is of vital importance from a military standpoint. No conclusions have been drawn as yet, but Dr. Bridgeman indicated that the solution might be found in use of fuel coolers, in conjunction with a supercharged fuel system to keep the fuel under pressure in the tank, lines, pump, and carburetor

A look into the future was given the Friday afternoon audience with presentation of two papers dealing with submerged engine installations. The paper on problems of submerged engine installations, prepared by Wellwood E. Beall and E. G. Emery, Jr. of Boeing Aircraft Company, was read by N. B. Moore, in charge of Aeronautics Department, University of California. This paper presented a discouraging array of problems requiring solution before submerged engines may be adopted. Benefit of such installations was reported as a speed increase of about 7 or 8 per cent on the basis of calculations that have been made. The four major problems were summarized as: 1. Development of satisfactory propeller extension shaft. 2. Safe disposal of exhaust gases. 3. Overall cooling of the engine compartment, including oil cooling, accessory cooling, exhaust disposal system cooling, etc. 4. Mounting of the engine, especially with respect to possible engine or propeller failure. Discussion raised the question of application of present types of long-nosed radial engines to submerged, or partially submerged mountings in the fore part of the wing. T. P. Wright reported seeing such an installation in England on the Blenheim bomber. Propeller shaft extension was 14 in., and cowl improvement was so great that one would estimate a performance gain of at least 5–10 miles per hour. Yet careful tests showed no gain whatever. However, use of propeller hub cuffs on the Supermarine Spitfire brought a gain of 10–12 mph.

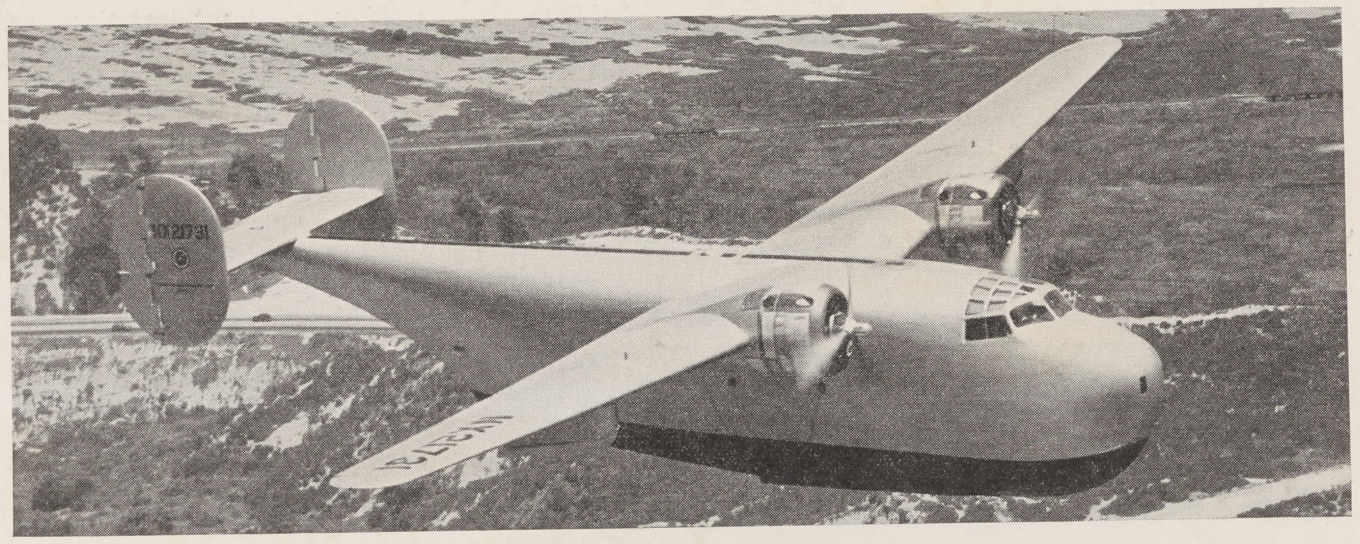
Discussing propeller requirements for submerged engine installations, George W. Brady, Curtiss Propeller Division of the Curtiss-Wright Corp., named two primary problems as improved aerodynamic treatment of the propeller hub shanks, and suitable structural support for the extension shaft. Vibration of the propeller-shaft-engine system is a major problem, but with the propeller mounted independently of the power-plant it may be possible to so greatly reduce propeller vibration as to make a reduction in propeller weight practicable. This weight saving could then be applied to the propeller drive and structural mount, reducing the overall increase in weight otherwise to be expected from use of such a system.

Brint Edwards served as chairman of the final session of the meeting, on Saturday morning, at which two papers were presented dealing with the light alloys of magnesium and aluminum. L. B. Grant, of the Dow Chemical Co. said (see also p. 36) that advantages of magnesium alloys to aircraft production were so great that only shop inertia could be responsible for failure to make wider use of the material to date. Europe is much ahead of us in this respect, customarily making much wider use of the material than in this country.

In discussing aluminum, G. D. Welty, Aluminum Company of America, presented a detailed history of the development of aluminum. He conceded that magnesium alloys, stainless steel, and plastics had all made inroads on the field of application of aluminum alloys, but felt aluminum is not yet at the zenith of its usefulness and will continue to be a major factor in aviation, and in industry generally for many years to come.

The LOG of the U.S. Naval Academy
Oct 27-'39

MODEL 31



CONSOLIDATED'S WONDER PLANE

by
F. M. HERTEL

WITH the boom of the heavy artillery resounding on both European fronts, there comes a noise quite as resounding in its nature here in our own country. This loud clamor is in the form of words, the bombshells of the alarmists. Every newspaper, some magazines, and various public meetings usually include within their sheets, pages, or programs one of these fear instilling bombshells in some form or another.

On every side we are peppered in machine-gun-like rapidity with stories of how the present aviation industrial setup in the United States is not, could never be, able to put this country on an equal wartime basis with the totalitarian states. However, the Consolidated Aircraft Corporation has launched what appears to be a successful counter attack using as its ammunition its new Model 31.

Each one of us here who has gone through Second Class summer or who has been here during the fall and spring has become acquainted with the PBY-2's. These ships and their younger brothers have been very useful to the U. S. Navy particularly on the long Pacific mass formation flights from San Diego to Hawaii and the various other bases located in those waters. The officers and men involved in these flights seem to have a habit of breaking records of times and performance as a matter of routine.

Lacking two days of ten months after its authorization by the Corporation, Model 31 was taking its first tests in its stride. Probably no other craft capable of carrying 52 passengers and having the same range and speed had been produced in such a short time. The overall length is 73′, height 22′, wingspan 110′, weight approximately 50,000 lbs.

It's normal crew will consist of five: pilot, co-pilot, navigator, engineer, radio operator. Since the ship was a private undertaking in every respect, it has no armament, but the Navy Department was cognizant of its construction. Such load carrying properties can easily be converted into military uses if the occasion arises.

To say that any one of its features is unique is to say that they all are. To begin with the beaching gear is included as part of the plane with provision for the complete hydraulic retracting of the tricycle arrangement into enclosed compartments for maximum efficiency in flight. The wing is full cantilever and has the fuel tanks built integrally. Contrary to former PBY construction the outboard floats retract to the underside of outer wing panels. The hull, streamlined to utter perfection and divided into two full decks has a large flight compartment and eight additional compartments.

And now, here is some dope about the twin engines which together with the three bladed 16 ft. Hamilton Standard Hydromatic propellors drive this ship through the air. They are Wright, 18 cylinder, twin-row radial engines each rated at 2000 H.P. at take-off. According to statistics compiled by the company's engineers these engines put out 2,200,000 ft.lbs. of energy in one second.

If a horse is given a standing area of 3′ x 8′, the standing space required would be 2.2 acres. Or if the average man works at rate of one quarter horsepower, the two engines are the equal of 16,000 men. Better yet for those steam savoirs who are interested, these engines require 125 cu. ft. of air per second to burn .778 lbs. of fuel to produce 15,000 B.T.U. The electric equivalent of heat liberated in this same time interval would operate for four and one-half hours a 1000 watt electric stove.

Taking both the speed of construction and the tremendous capabilities of the Model 31 into consideration, this counter attack launched by Consolidated should silence the guns of the alarmists.

Edison Praises Efficiency of Navy; Mentions Epic Flights of S. D. Airmen

(Editor's note: This is the second in a series of four articles covering the major portion of the annual report of the secretary of the navy. Prepared by Acting Secy. of the Navy Charles Edison, it was released through The Associated Press. The next article will appear next Tuesday.)

Employment of Forces

Operations of our naval forces during the past year have been conducted in accordance with the United States naval policy to maintain the navy in sufficient strength to support the national policies and commerce and to guard the continental and overseas possessions of the United States. They have been disposed to operate with a minimum expenditure of funds.

In adhering to the naval policy the employment of forces has been effected with the following in view:

(a) To exercise and train the units of the fleet to the highest state of efficiency:

(b) To organize the navy for operations in either or both oceans so that expansion only will be necessary in case of national emergency;

(c) To protect American lives in disturbed areas;

(d) To assist in evacuating American nationals from areas of especial danger;

(e) To maintain uninterrupted communications with and for American nationals and for our diplomatic and consular establishments in the areas involved;

(f) To cooperate fully with other departments of the government and with the states; and

(g) To cultivate friendly international relations.

The number of ships in commission and operated at sea included 15 battleships (3 in reduced commission), 18 heavy cruisers, 18 light cruisers, 181 destroyers and light mine layers (23 in reduced commission), 58 submarines, 5 aircraft carriers, 1 mine layer, 12 patrol vessels, and 100 auxiliaries of all types.

Included in the foregoing, the following new ships were placed in commission during the year: 1 heavy cruiser, 3 light cruisers, 8 destroyers, 4 submarines, 2 aircraft carriers and 1 oil tanker. Other ships placed in full commission were 2 mine sweepers, 1 cargo ship and 1 harbor tug.

The following ships were placed out of commission during the year: 11 destroyers, 1 river gunboat and 2 harbor tugs. In addition, 12 vessels of various types were stricken from the navy register.

The ships of the navy were maintained in the same general organization as in the recent past, namely, the United States fleet, the Asiatic fleet, the special service squadron, and the naval transportation service. The squadron designated as Squadron 40-T has continued to operate in the western Mediterranean.

United States Fleet

The United States fleet remained concentrated during the fiscal year and was under the command of Adm. Claude C. Bloch, U.S.N.

On Jan. 4, 1939, in accordance with approved employment schedules, the fleet sailed from west coast bases for the Canal Zone. The fleet made a mass transit of the canal on Jan. 13, 1939, and proceeded to base in the Guantanamo-Culebra area. Fleet problem XX was conducted in February and March in the Caribbean area and off the northeast coast of South America. The latter phase of the problem was witnessed by the president of the United States and the chief of naval operations in Houston. On completion of the problem the fleet dispersed for visits to Caribbean ports.

In April the fleet proceeded to the Hampton Roads area; cruisers and destroyers visiting gulf and South Atlantic United States ports. A scheduled visit of the fleet to New York to attend the opening of the World's Fair was canceled, and the fleet departed for west coast bases on April 20.

Vessels of the fleet were detailed to train naval reserves and naval reserve officers training corps units on the west coast as in previous years.

The Atlantic squadron, United States fleet, was organized in January, 1939, and includes the former training detachment, United States fleet, in addition to certain other vessels. This squadron has been actively engaged on the east coast in training naval reserves, naval reserve officers training corps units, and midshipmen. The Atlantic squadron took part in fleet problem XX and conducted fleet landing exercise 5 in the Culebra area. The midshipmen's practice cruise for 1938 was made by New York, Texas and Wyoming to foreign ports. The cruise for 1939 is now being made by New York, Arkansas and Texas to Canadian and United States ports with the first and third classes of the midshipmen. The midshipmen of the second class are being cruised in east coast waters in six destroyers of the Atlantic squadron.

Aviation

Throughout the year, the aircraft carriers Saratoga, Lexington and Ranger, with their attached squadrons, have been assigned to the battle force. In January, Enterprise and Yorktown, with their squadrons, reported to the commander-in-chief and were assigned to aircraft battle force.

On April 15, Ranger and attached squadrons were assigned temporarily to duty with the Atlantic squadron.

There were a number of changes among the squadrons and tenders of aircraft scouting force throughout the year.

VP squadrons 20 and 21 were commissioned Sept. 1, and were assigned to patrol wing 4 at Seattle. In January, Childs and Williamson, destroyers converted to seaplane tenders (small), were assigned to aircraft scouting force.

In accordance with the current naval aeronautic organization, ship units for new cruisers were formed in the year as their parent vessels were completed, viz., Phoenix, Boise, St. Louis and Wichita.

The patrol squadrons of aircraft scouting force operated extensively in the following areas: east coast, Caribbean, Canal Zone, west coast, southeastern Alaska and Hawiian Islands. The tactical squadrons of the First Marine aircraft group, normally based at Quantico, Va., and Marine scouting squadron 3, based at St. Thomas, V. I., participated in the fleet problem and fleet landing exercise 5 in the San Juan-Culebra area. The tactical squadrons of the Second Marine aircraft group, based at Naval Air station, San Diego, participated in several landing exercises in conjunction with the operation of the Fleet Marine force; in tactical exercises in connection with fleet operations; and in indoctrinal operations aboard aircraft carriers.

Special operations, additional to those regularly scheduled for naval aircraft, were conducted as follows:

On Sept. 7, 1938, 17 patrol planes comprising patrol squadron 4 and five spare planes, were ferried nonstop from San Diego to Pearl Harbor.

On June 28, 1939, 15 patrol planes of patrol squadron 1 were ferried nonstop from San Diego to Pearl Harbor.

Presidential mail was delivered by patrol airplanes from Miami to various points in the Caribbean in the cruise of the president in Houston in connection with fleet problem XX.

VMF squadron 1 of the First Marine aircraft group, Quantico, participated in the national air races at Cleveland, O., Sept. 3 to 5, 1938.

Although part of regularly scheduled exercises, the operations of patrol wing 1 in connection with fleet problem XX are worthy of note. That wing, comprising 48 patrol airplanes, departed San Diego for Coco Solo, nonstop, Jan. 10, 1939, and arrived at their destination Jan. 11. From Coco Solo the wing flew to San Juan, P. R., Jan. 23, and while based in that vicinity participated in fleet landing exercise 5 and fleet problem XX. After completion of fleet problem, patrol wing 1 proceeded nonstop from San Juan to Norfolk, Va., March 9, and while on the east coast participated in a joint air exercise off the New England coast, basing at Newport for that purpose. Two squadrons of this wing were retained on the east coast, the remaining two returning to San Diego by way of Guantanamo, Coco Solo and the Gulf of Fonseca, leaving Norfolk May 1 and arriving San Diego May 10. Exclusive of distance flown in connection with the fleet problem, patrol wing 1 covered a distance of over 10,000 miles on its cruise.

Fleet Training

Tactical exercises were held periodically during the year by all units of the fleet. Advances were made and experience gained in the employment of the various types. The year's training culminated in fleet problem XX, comprising operations in the Atlantic ocean, east of the West Indies. Annual fleet problems should be continued, as they are of the utmost value in training the personnel of the fleet.

The major units of the United States fleet should continue to be based in the same general operating areas as this policy affords the maximum opportunity for tactical training and indoctrination between types.

Naval Communications

Thirty-six naval radio traffic stations have been in commission in the past fiscal year. Five such stations have been maintained in inactive status. Thirteen United States missions abroad have maintained radio receiving sets for the purpose of copying the state department bullets broadcast daily from the naval radio stations at Washington and Cavite.

The expansion and communication training of the naval communication reserve has made satisfactory progress during the past year. There are now 30 reserve radio control stations equipped with government-owned transmitting and receiving equipment The communication reserve has rendered valuable service in local emergencies during storms and floods, especially in the disruption of communications in New England following the hurricane of September, 1938.

Calif., Monday, December 4, 19

New Building, Plan as Big Air Order Due

Trib. Sun 12-4-39

Award of a $20,000,000 contract to Consolidated Aircraft Corp. for building new navy patrol bombers, which may be made this week, will necessitate the construction of a new factory building at the Lindbergh field plant of the firm, which probably would be completed in six months' time, officials of Consolidated report. Maj. R. H. Fleet, president of the firm, flew to Washington, D. C., last week to confer with navy authorities, and is reported holding the view the navy department should bear the greater part of the expense of the addition, as the building would not be used under normal manufacturing conditions in the aircraft industry.

The estimated cost of the building is said to exceed $1,000,000. The building, which would be located north of the present factory, would be 400 by 900 feet. If the contract for the planes is awarded and the building erected, it is estimated employment to between 2000 to 3000 men would be given.

Union Dec. 8-39

Club to Hear Talks On Aircraft History

Pt. Loma Community Men's club will hold its December dinner meeting Wednesday at 6:30 p.m.

Capt. Roscoe Arnett, president, has invited two speakers. Comdr. Roland G. Mayer, U.S.N. ret., in charge of the U. S. Navy inspection of aircraft at the Consolidated Aircraft Corp., will give "A Short History of Flying Boats in the U. S. Navy." Comdr. Mayer was second in command of the ill-fated dirigible Shenandoah and he has the distinction of having spent more time in the air in lighter-than-aircraft than any other naval man.

The second speaker will be Maj. Edgar M. Gott, vice president in charge of public relations at Consolidated. He will give a brief resume of "Highlights of the Consolidated Aircraft Corp. Since its Inception 16 Years Ago."

Following the speakers, a sound film, "Construction of Aircraft in the Plant of the Consolidated Aircraft Corp." will be shown. Mrs. George Rye will sing, accompanied by Mrs. Burling M. Stump.

Union Trib 12-11-39

Thursday Set For Flight of Consair Plane

Naval authorities tentatively have set Thursday at dawn as the take-off time for a huge long-range Consolidated-built patrol bomber, which is to flown nonstop to Washington for final acceptance tests at the naval air station at Anacostia, D. C. Bearing the designation XPBY-5A, the plane is somewhat similar to the PBY-type patrol planes used on several long-distance overwater mass flights.

Two pilots, Lts. Carl E. Geise and Roy Jackson, and a crew of seven mechanics and radio operators will make the trip in the twin-motored craft. The plane can operate on land or sea and in remote bases where floating aircraft tenders are unavailable. The amphibian also can climb a ramp or beach under its own power, thus eliminating the necessity for a beaching crew.

A tricycle type landing gear has a single wheel forward and two aft, all retractable. The nose wheel is completely enclosed in the retracted position, and contributes to the streamlined appearance of the bomber when in flight. The extended gear serves as a sea anchor in rough water landings and greatly assists the pilot in retaining control.

According to aircraft officials the plane is especially adaptable for service out of the new naval bases being established in Alaska and the West Indies, where rough water landings and take-offs are common.

Giant Amphibian To Leave S. D.

Union 12-11-39

Test Hop Planned To Washington

Piloted by Lts. Carl E. Geise and Roy Jackson and carrying a crew of seven mechanics and radio operators, the world's largest amphibian long-range navy patrol bomber will leave here this week on a non-stop flight to Washington. Weather conditions permitting, the take-off probably will be soon after dawn Thursday.

Built by Consolidated Aircraft Corp. for the bureau of aeronautics, the huge flying boat is to be flown to the naval air station at Anacostia, D. C., for final acceptance tests.

(Picture on Page B.)

Designated the XPBY-5A, the twin-motored plane embodies many of the characteristics of the famed PBY-type patrol bombers which have achieved many long-distance overwater mass flights from San Diego to Panama, Hawaii, the Philippines and the West Indies.

Because the new plane can operate on land or sea and in remote bases where floating aircraft tenders are unavailable, the amphibian patrol bomber opens up a new era of long-distance flight operations for the navy's air patrol wings, officials assert.

RETRACTABLE GEAR

The landing gear is of the tricycle type, a single wheel forward and two aft, all of which are fully retractable. All three wheels are

Giant Amphibian To Leave S. D.

(Continued from Page 1)

operated by a central hydraulic power drive and the operations are carried out in sequence automatically. The nose wheel in the bow is completely enclosed in the retracted position, thus contributing to th streamlined appearance of the bomber when in flight.

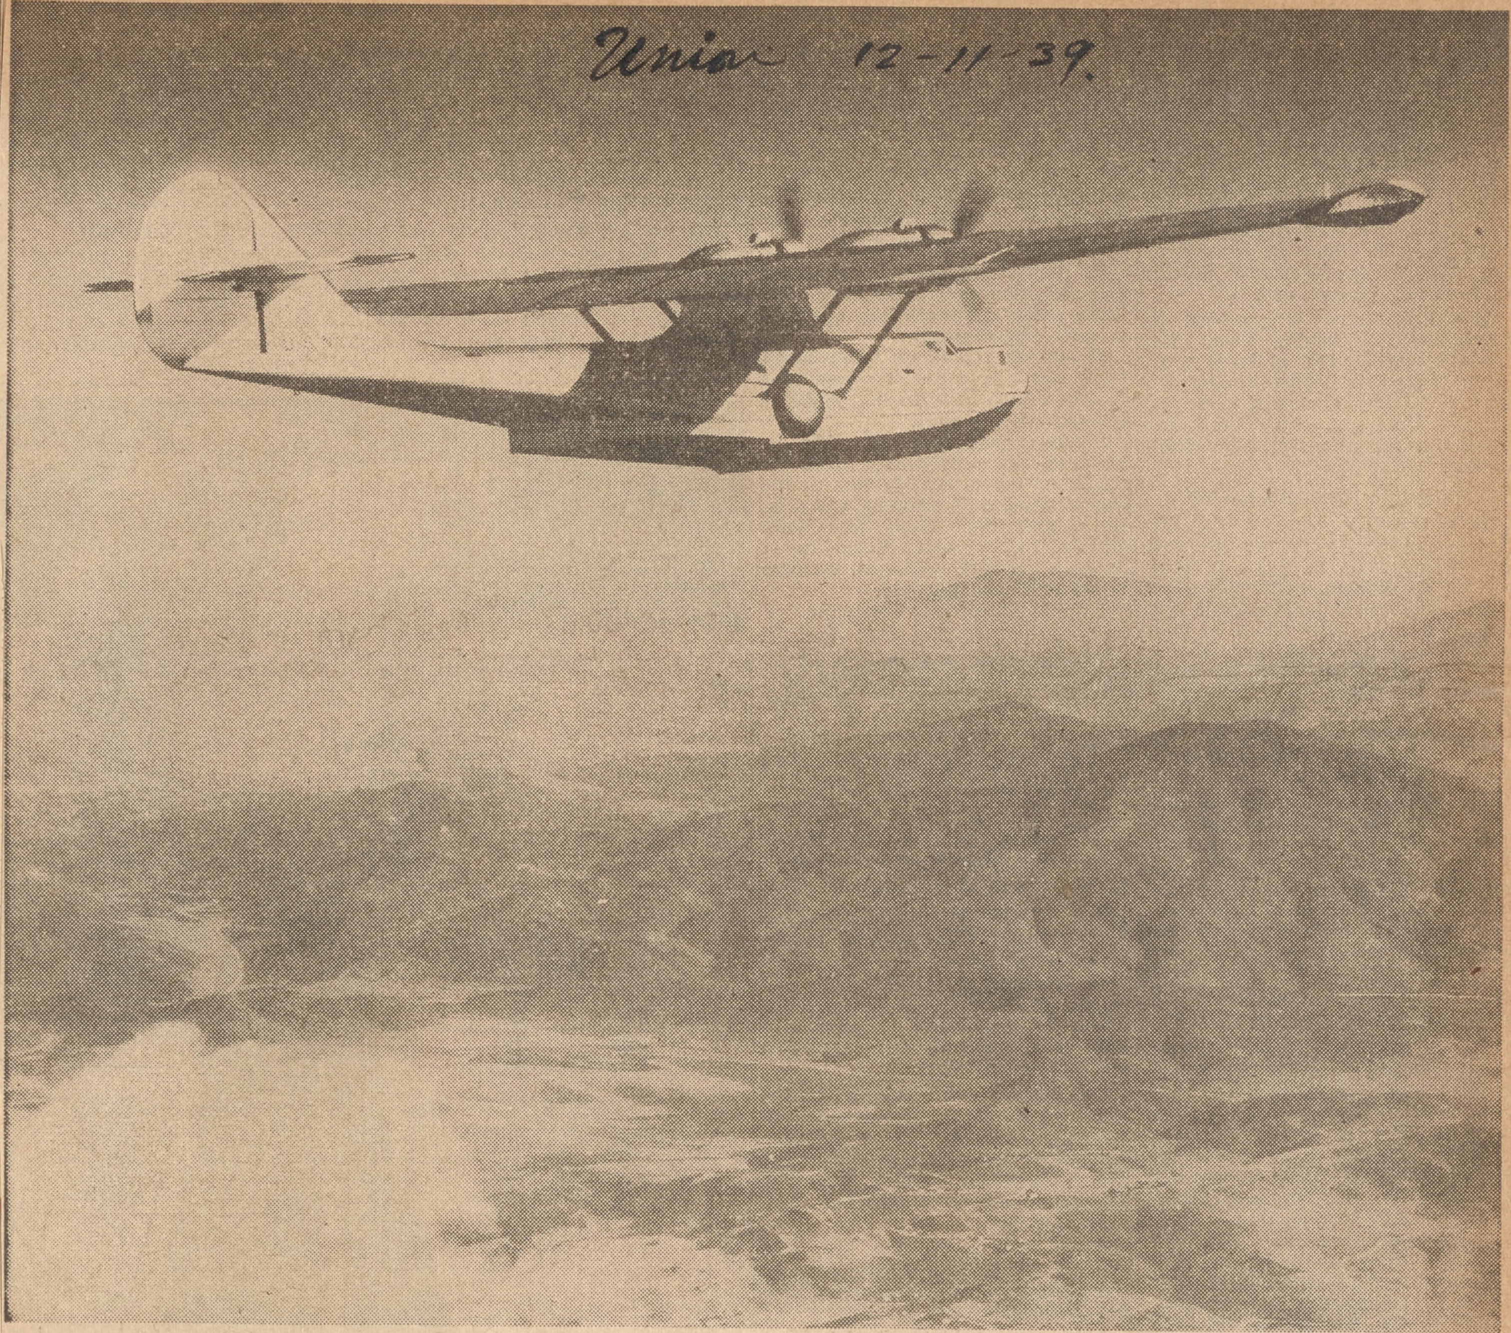
For rough water flight operations the extended gear serves as a sea anchor and greotly assists the pilot in retaining control. Turns on the water are achieved with far less skidding.

NO LANDING CREW NEEDED

One of the important factors is the elimination of a beaching crew as the amphibian can climb a ramp or beach under its own power or be launched in the same manner.

Aircraft officials stress the new Consolidated plane especially is adaptable for service out of the new naval aviation bases being established in Alaska and the West Indies where rough water landings and take-offs are the rule rather than the exception.

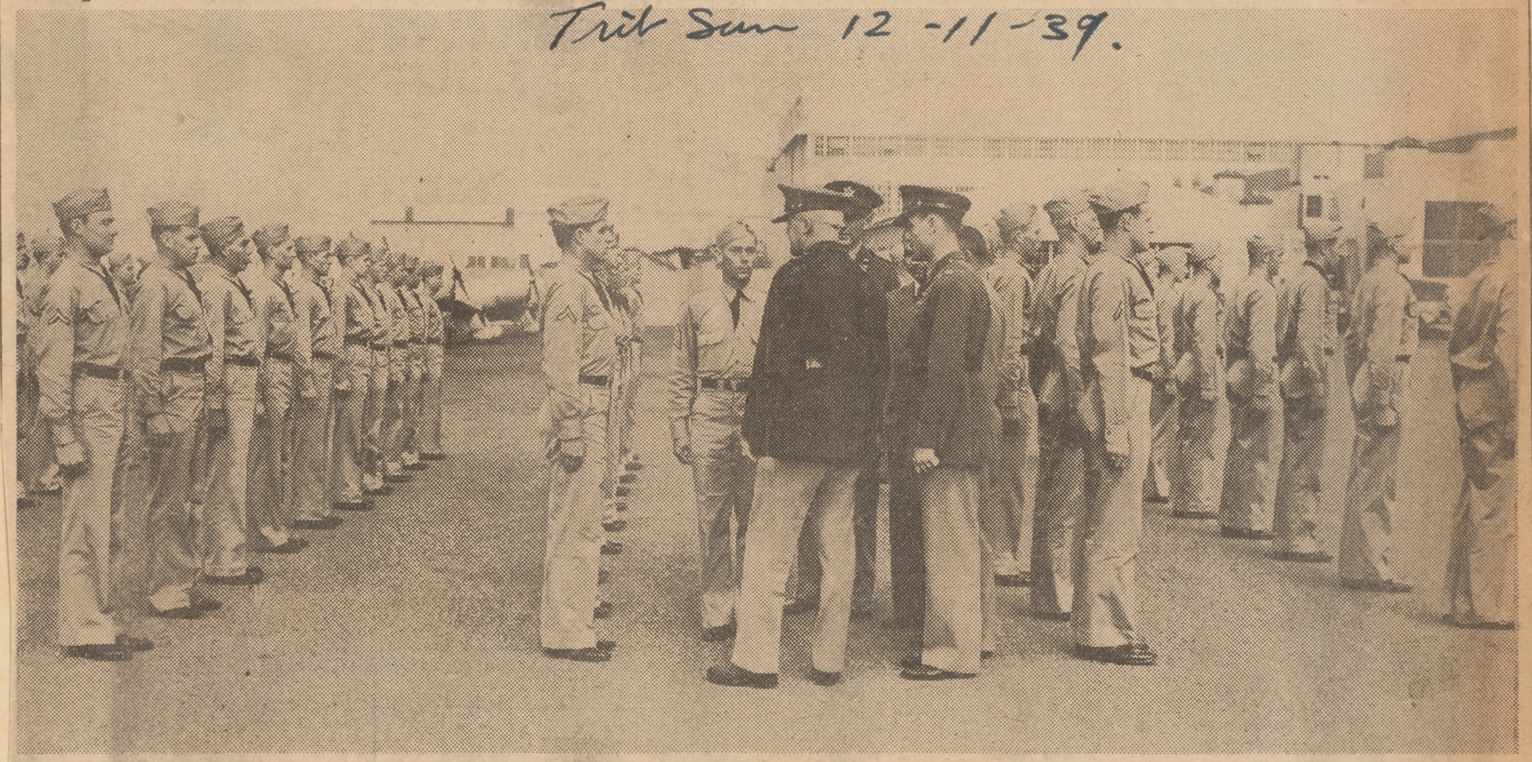
Union 12-11-39.



World's largest amphibian bomber, this Consolidated-built twin-motored plane will leave San Diego this week on a non-stop flight to Washington, where final tests are to be made before acceptance. Story on Page 1.

Army Air Chief and Officer Group Review Cadets in Training at San Diego School

Trib Sun 12-11-39.



Maj. Gen. Henry H. Arnold, chief of the army air corps, is shown here with a group of officers at Lindbergh field reviewing air corps cadets in training at the Ryan school. Arnold is in the immediate foreground, at the left of the knot of officers.—(William Wagner photo.)

ARNOLD PLEASED AT PROGRESS IN PLANE BUILDING

Visibly pleased by San Diego's progress in aircraft manufacture and as a training center for flying cadets, Maj. Gen. Henry H. Arnold, chief of the army air corps, made a hurried, but thorough, inspection of the Ryan and Consolidated plants here today.

"I have nothing to say now," Arnold declared. "This is a routine inspection by the chief of the air corps."

Arnold's expression as he viewed the trim corps of cadets lined up in front of the Ryan plant as he arrived there was sign enough that the air corps chief is pleased with the caliber of the men in training and type of instruction they are receiving. He not only reviewed the gray-clad cadets on the field, but interviewed a few who were in the new barracks in the 3300 block on India st.

Thoroughness of Arnold's "inspection technique," employed when he has only a brief three hours to cover the air corps points of interest, was shown by the fact that he assigned individual officers in his party to go through the various shops, schools and hangars while he conferred with aircraft plant executives, inspected the barracks and viewed army planes being manufactured by Ryan and Consolidated. With Arnold were Col. J. H. Burns, executive in the office of the assistant secretary of war; Col. D. N. W. Grant, army medical corps; Lt. Col. Fabrian L. Pratt, army medical corps; Maj. R. M. Webster, air corps, and Capt. E. H. Beebe, aide to Arnold.

Arnold, former Rockwell field commanding officer, arrived here from March field in an army Douglas staff plane at 8:30 a.m. He left at 11 a.m. for Glendale, from where he will fly to San Francisco.

1939

Arnold Pleased With Air Cadets, Plane Factories

It was a flying trip in more ways than one for Maj. Gen. Henry H. Arnold, chief of the army air corps, who landed at Lindbergh field at 8:35 a. m. yesterday, and three hours later was in the air again.

Although he had nothing to say for publication, Gen. Arnold, former commanding officer at Rockwell field here, was visibly pleased with the result of his inspections of local aircraft plants — Ryan and Consolidated — and of the army cadets who are getting their preliminary flight training at the Ryan school, and are quartered at the new cadet barracks on India st. While he conferred with plant executives and covered the high spots of the shops, he sent the officers of his staff on hurried inspection trips which resulted in contacting everything.

STARTED WEEK AGO

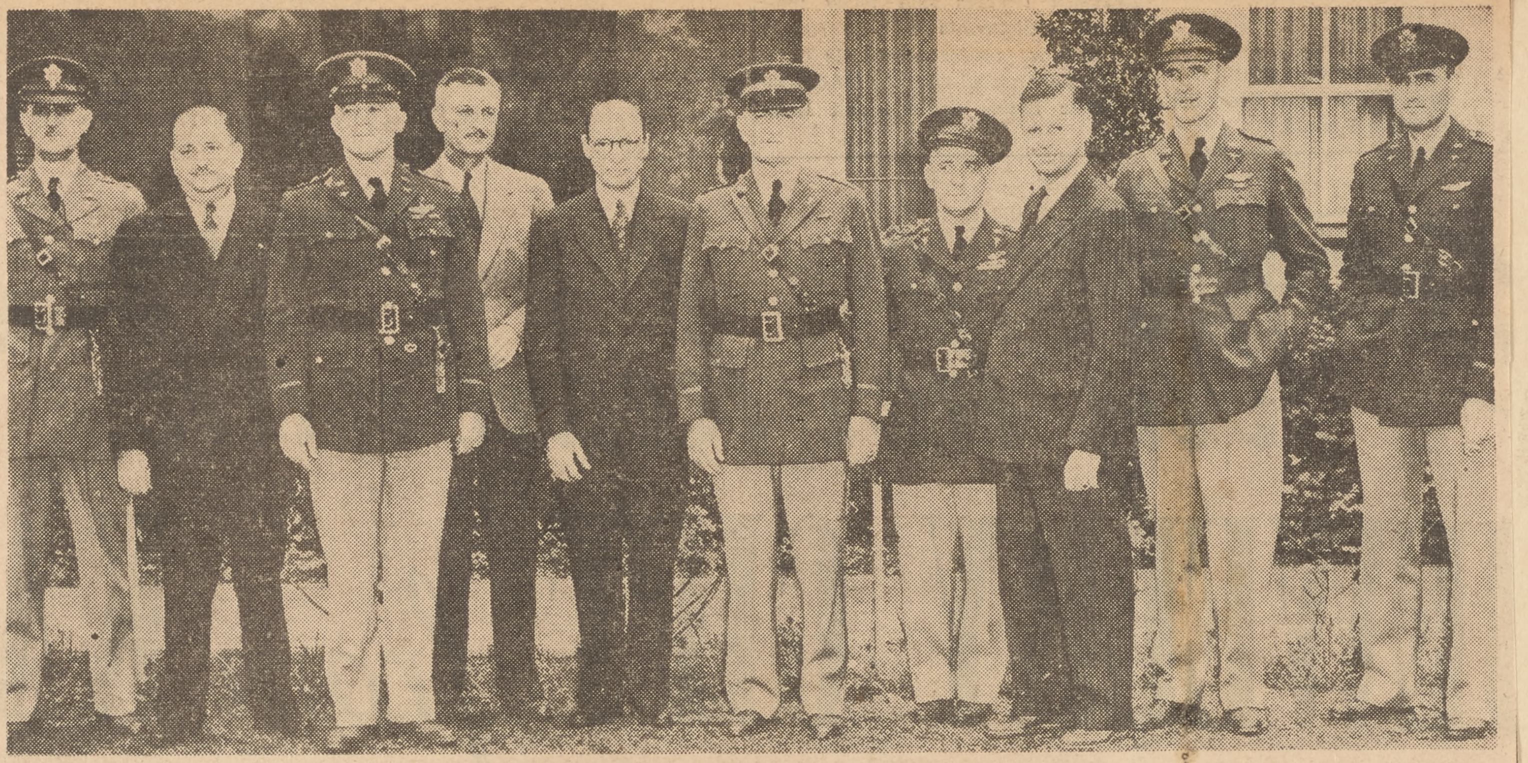
It was just a week ago yesterday that Gen. Arnold and his party left Washington. Before reaching here they attended the officers' graduation exercises at Maxwell field, and inspected the southeast air bases under construction at Tampa and Mobile; Bakersfield field; the training center at Randolph field, and also March field.

The big Douglas staff plane took off from here for Glendale, where aircraft factories and training activities in the Los Angeles area were due for inspection yesterday and today. The plane then will take the corps chief on to the air depot at Sacramento, and then will visit Portland, Seattle and Tacoma air corps activities before heading back to Washington, D. C.

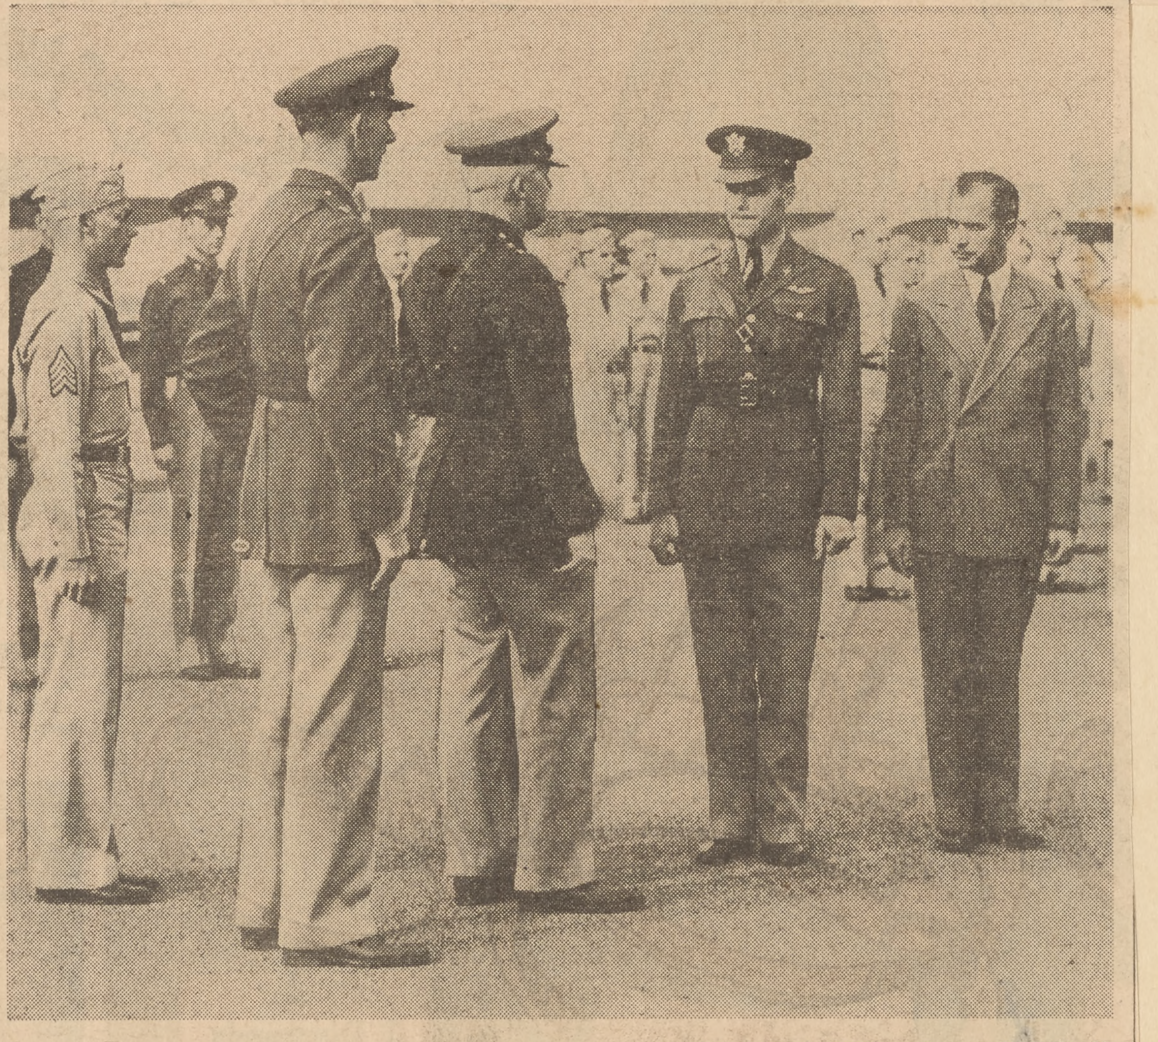
PARTY NAMED

Accompanying Gen. Arnold were Col. J. H. Burns of the ordnance department, who is attached to the office of assistant secretary of war; Col. D. N. W. Grant, medical corps, from Bardsdale field; Col. F. L. Pratt, medical corps, in charge of flight surgeons' training at Randolph field, and the following air corps officers: Maj. R. M. Webster, from the flight training section office at Washington, D. C.; Capt. E. H. Beebe, pilot and aid to Gen. Arnold, and Lt. L. R. Parker, from Bolling field, Washington, D. C.

ARMY'S AVIATION HEAD PAYS 'FLYING' VISIT TO SAN DIEGO



Maj. Gen. H. H. Arnold, air corps chief, paid an official visit here yesterday. Left to right: Col. D. N. W. Grant; I. M. Laddon, Consolidated vice president; Gen. Arnold, Maj. E. R. McReynolds, local air corps representative; C. A. Van Dusen, Consolidated vice president; Col. J. H. Burns; Col F. L. Pratt; E. N. Gott, Consolidated vice president; Maj. R. M. Webster and Capt. E. H. Beebe.



With the cadets lined up in the background are (left to right) Cadet Capt. William Large, Maj. R. M. Webster, Gen. Arnold, Capt. J. C. Horton, commanding the training detachment, and T. Claude Ryan.

S. D. Plane Leaves; Largest Amphibian

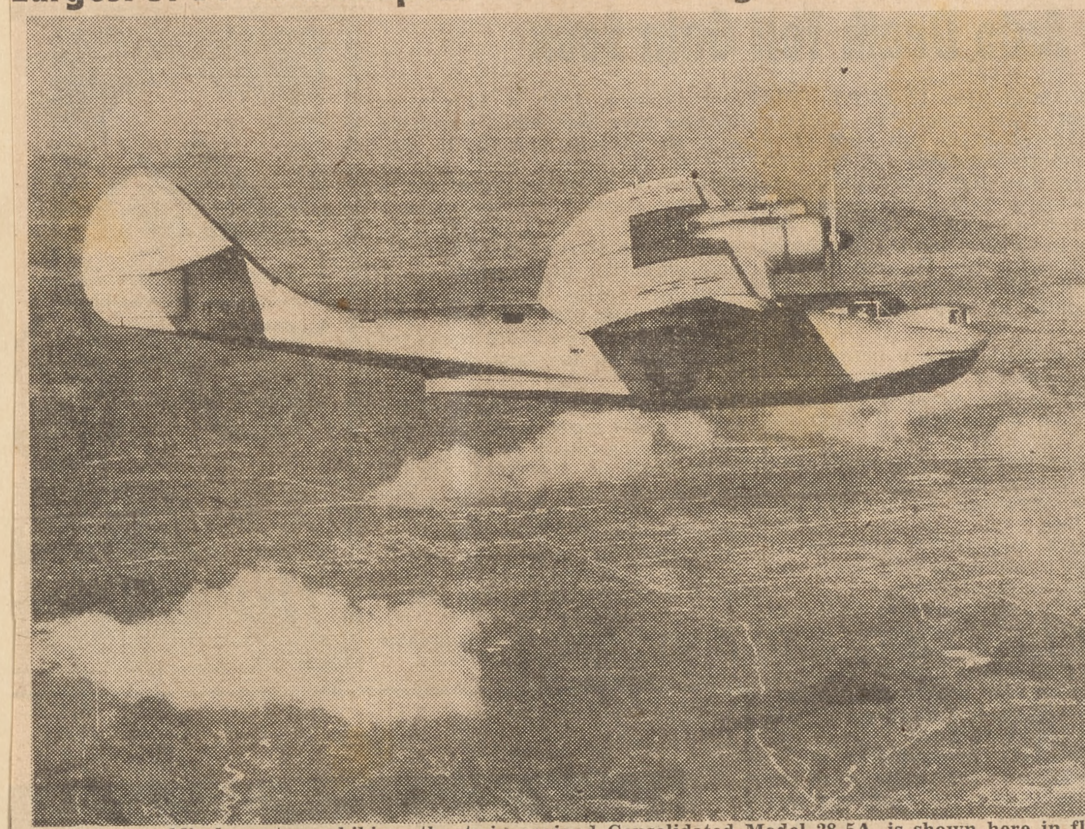
The world's largest amphibian plane, Consolidated's twin-engined Model 28-5A built for the United States navy, today was en route east from here for Anacostia, D. C., for a series of acceptance flights. The plane left the naval air station at 7:20 a.m., and is scheduled to arrive at Anacostia tomorrow.

Capable of taking off or landing either on land or water, the plane will spend tonight at San Antonio, Tex., where it is expected to land between 4 and 5 p.m. Aboard are six men, as follows: Lt. Carl E. Giese, pilot; Lt. Roy Jackson, copilot; Chf. Radioman Wilson, Aviation Mach. Mate (1c) Frye, Aviation Mach. Mate (2c) Dills, and G. R. Tibbs, a mechanic from the Consolidated plant.

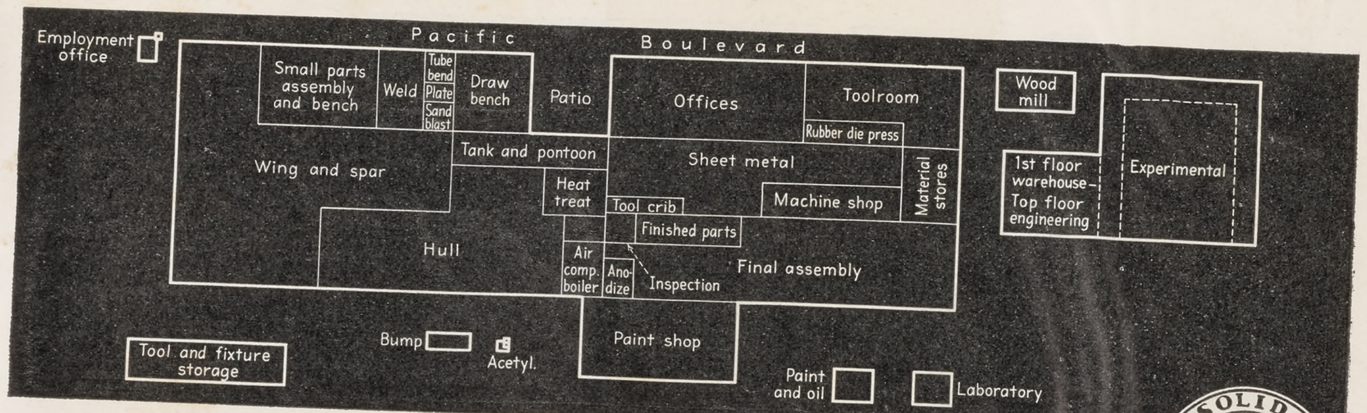
Consolidated's newest contribution to aeronautical progress is basically the firm's Model 28 twin-engined flying boat which the navy knows as the PBY. The inherent advantages of the PBY planes have been retained, and the greater advantage of land-plane operation added. The craft's landing gear is of the tricycle type, with a single wheel forward and two aft, all of which are fully retractable.

Trib Sun 12-12-39

Largest S. D.-Built Amphibian Plane Going East for Tests



The world's largest amphibian, the twin-engined Consolidated Model 28-5A, is shown here in flight. Built for the United States navy, it carries the markings XPBY-5A. The nose wheel retracts into the bow, while the side wheels retract into wells. Basically the familiar model 28, or navy PBY, the new amphibian retains its famous flying boat characteristics and adds in the advantages of land plane operation, with several advantages for seaplane operation. The plane is to be flown east Thursday for tests at Anacostia, D. C.—(Official United States navy photograph.)



CONSOLIDATED of San Diego

Has a daylight factory built for line production of large aircraft.

By C. F. McReynolds

West Coast Editor, Aviation

LOCATED on Lindbergh Field, San Diego, California, the Consolidated factory has been built from the ground up to handle large aircraft. We might say that the plant has been built "from the water up" as most of the ground on which it stands was reclaimed from San Diego Bay and this filled land has presented certain special problems which had to be solved in building the factory and installing certain heavy machinery. The Consolidated factory is located in the Southern California aircraft industry area which provides unusual facilities for supply of all needed materials and supplies, as well as a favorable reservoir of trained men. The plant is located on Lindbergh Field, with unobstructed access to runways, and to quiet waters for launching and flight testing of flying boats. Supplies may be and are brought in by water, rail, highway, and air, with delivery right at the factory door. Equable weather conditions in the San Diego area have made it practical to build a factory that is "all windows and doors", of relatively light, long span roof construction, and with no major heating problem. In addition, a high percentage of operations are performed in the factory yard, which serves as an integral part of the plant without requiring the expenditure of capital for roofing, heating, etc. Enclosed by a high fence, the yard area is well supplied with electric power outlets, air, water, and other facilities, and is used for a major portion of all final assembly operations. The area under roof at the Consolidated plant is approximately 450,000 sq. ft., with an additional 212,462 sq. ft. in usable yard area. The main factory building extends for 1025 ft. along the east side of Lindbergh Field, and has a width of 300 ft. Construction is of steel frame with saw tooth roof, galvanized iron siding, generous window area, and with almost continuous doors along the field side to permit shifting planes off the production line at any desired point. The east 200 ft. of the factory building has a ceiling clearance of 14 ft., as this area is largely devoted to miscellaneous manufacturing operations, machine shops, and offices. The remaining 100 ft. of factory width serves as the final assembly bay, extends the full length of the building, and has a height of 30 ft. Adjoining the main building at the center of the assembly side is the paint shop, measuring 200 by 100 ft., and also having a ceiling clearance of 30 ft. This permits shifting hulls and other bulky parts out of the assembly line, into the paint shop, and back to assembly without difficulty. An experimental building is located south of the main plant and separated from it by a 50 ft. alleyway. This building, of construction similar to the main building, houses an experimental section measuring 225 by 250 ft. with a 40 ft. ceiling clearance, and a receiving stores section 125 ft. square, with a second floor which carries the engineering department. There are two mezzanine floors extending around three sides of the experimental shop, the fourth being reserved for doors opening on the flying field. The lofting department of engineering occupies a major part of these mezzanine areas. Other Consolidated factory buildings located adjacent to the main plant include the wood mill, tool storage shed, laboratory, and paint storage building.

The modernization program recently completed entailed an expenditure of more than $500,000 for new equipment alone. Although presses and drop hammers represented the major items of expenditure, numerous pieces of equipment were added to the machine shop, including three Brown & Sharpe automatic screw machines, two Cleveland screw machines, a Cincinnati centerless grinder, and a LeBlond gap lathe to swing 50 in. For the drop hammer die foundry two James H. Knapp gas fired tilting type melting furnaces were installed, each with a capacity of 8,300 lbs. of zinc alloy or 12,000 lbs. of lead. To supply power for the new air operated drop hammers a Worthington 20 in. x 12 in. x 14 in. horizontal two stage compressor was installed. Driven by a 200 h.p. electric motor, this compressor has a capacity of 1150 cu. ft. of air compressed to 100 sq. in. per minute. This brings the total air compressor plant to a capacity of 2275 cu. ft. per minute. A stand-by

1. Riveting is largely the means of fabrication for today's large aircraft. Squeezers, guns and hydraulic yokes are employed.

2. Pneumatic tube bending machines are now coming into use. In the Model 28 Consolidated twin engined flying boat, approximately 900 feet of tubing is employed.

3. Power end of the cable stretching machine with a capacity up to 20,000 lb. Designed and built by Consolidated Aircraft for pre-stretching all control cables.

4. Back spotfacing a fitting through use of a drilling fixture.

5. A multitude of small machined parts are made for use in the airplane. Here cable terminals are being milled in a special fixture.

6. Cold working of dural parts increases their strength. Thin sections, extreme curvatures, bring problems not encountered elsewhere.

7. Rivets of many sizes and shapes to the tune of a million per week can be turned out by these two rivet making machines.

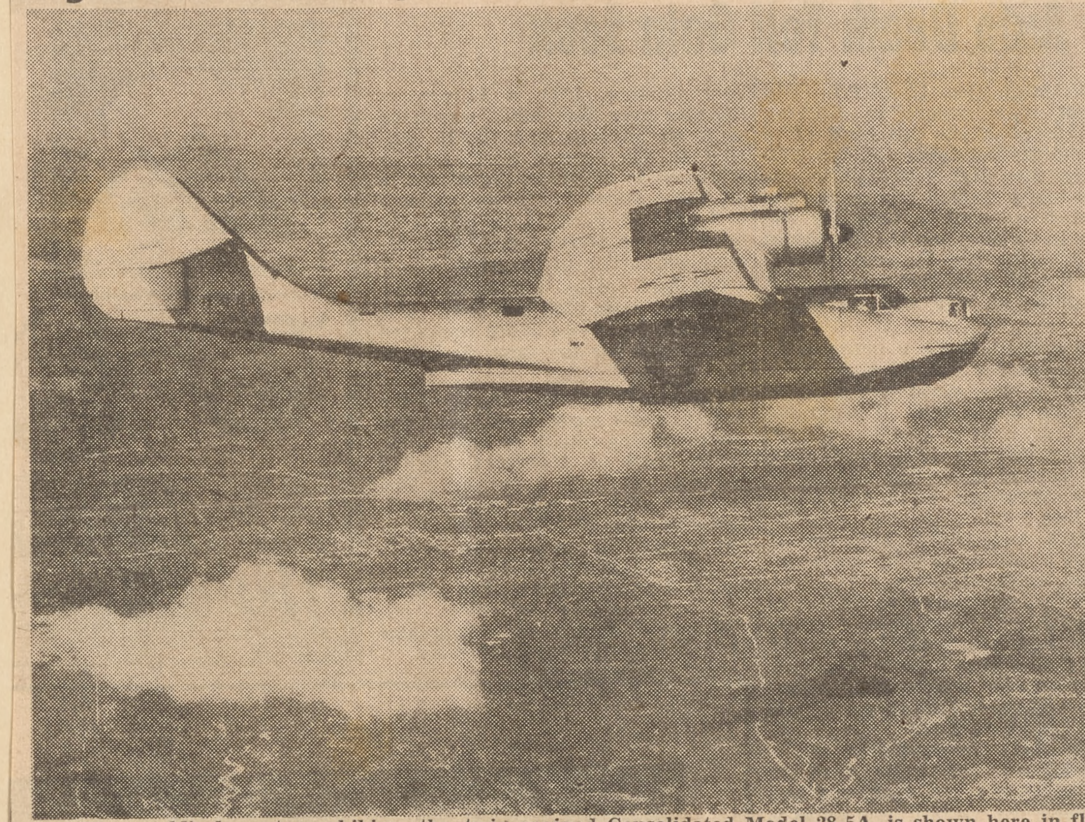
Largest S. D.-Built Amphibian Plane Going East for Tests



The world's largest amphibian, the twin-engined Consolidated Model 28-5A, is shown here in flight. Built for the United States navy, it carries the markings XPBY-5A. The nose wheel retracts into the bow, while the side wheels retract into wells. Basically the familiar model 28, or navy PBY, the new amphibian retains its famous flying boat characteristics and adds in the advantages of land plane operation, with several advantages for seaplane operation. The plane is to be flown east Thursday for tests at Anacostia, D. C.—(Official United States navy photograph.)

system is provided to supply Butane gas to the boilers, heat treat equipment, and furnaces in emergency.

A new salt bath furnace was installed in the heat treat department, with a capacity to heat treat 2000 lbs. of aluminum alloy parts per hour in a salt pot 21 ft. long and requiring approximately 18,000 lbs. of potassium nitrate and the same amount of sodium nitrate for its initial charge.

Additional facilities provided in the paint shop include a huge paint booth for hull finishing. Measuring 30 ft. long, 20 ft. wide, and 18 ft. high, this booth has complete lighting and ventilating facilities. Two open front booths for miscellaneous spray work are 10 ft. high, 8 ft. deep, and 30 and 65 feet long respectively. Air is pumped through the paint shop at the rate of 203,000 cu. ft. per minute by means of nine exhaust fans requiring 62½ motor horsepower.

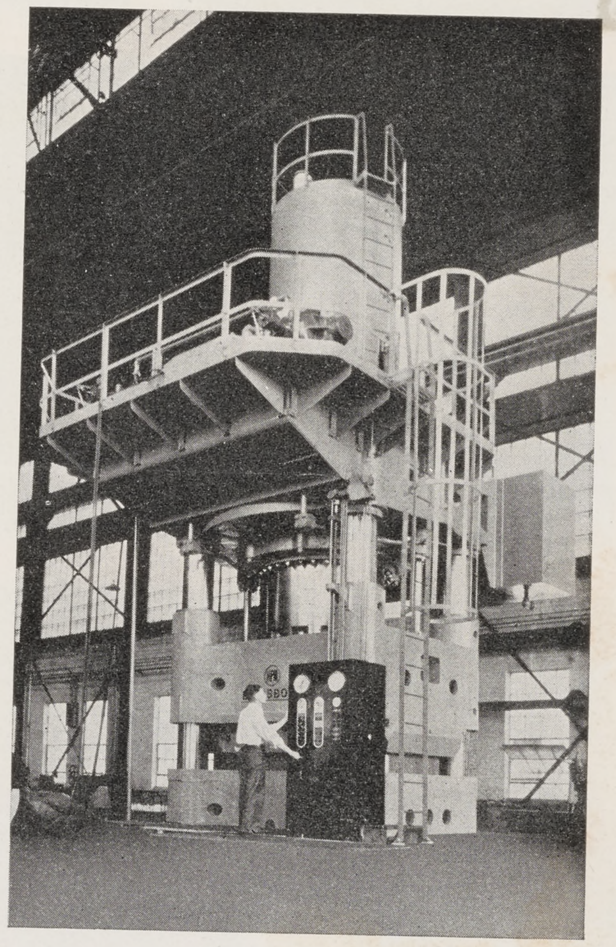
Major new equipment item, and the center of greatest interest in connection with the modernization program, is the battery of presses and drop hammers installed. This includes a 4500 ton Birdsboro hydraulic press, a 1000 ton Hamilton double crank punch press, four Chambersburg air operated drop hammers, and four new rope lift type drop hammers of Consolidated design and manufacture. The Birdsboro-HPM press has a 48 in. working stroke, a platen area 140 by 118 in., a total weight of 610,000 lbs. and a foundation weight of 225,000 lbs. The air operated drop hammers vary in size from 101,000 pounds gross weight down to 33,000 lbs. The big hammer has a stroke of 72 in. and platen area 48 by 96 in. It can accommodate punches, or dies, up to 50,000 lbs. in weight. The foundation weight, for the inertia block alone, amounts to 415,000 lbs.

Installation of these drop hammers occasioned unusual engineering difficulties due to the filled ground on which the plant is built, which we referred to earlier. Since the hammers were to be installed in the center of the main factory and quite close to the offices, it was considered desirable to minimize if not eliminate the pounding action usually associated with operation of drop hammers. Also, due to the unsatisfactory bearing qualities of the sub-soil, it was feared that such a heavy drop hammer would pound its foundation, no matter how massive, right down through the floor and out of sight. Load bearing and vibration transmission problems were solved simultaneously by provision of an ingenious "earthquake proof" mounting. Steel piles of "H" section were first driven 60 ft. into the sub-soil. As the roof clearance was only 30 ft. it was necessary to drive these piles in increments, welding on short sections as the work proceeded. A heavy concrete foundation "box" was constructed on top of these pilings, with the top of the box open and flush with the factory floor. Inside the box an inertia block was constructed and suspended from steel beams floating on Korfund coil steel springs supported on the foundation box. The drop hammer, mounted on this inertia block, transmits its shock to the block, resulting in a maximum deflection of the steel springs of about ½ in., and eliminating all shock to the main foundation box or the building proper.

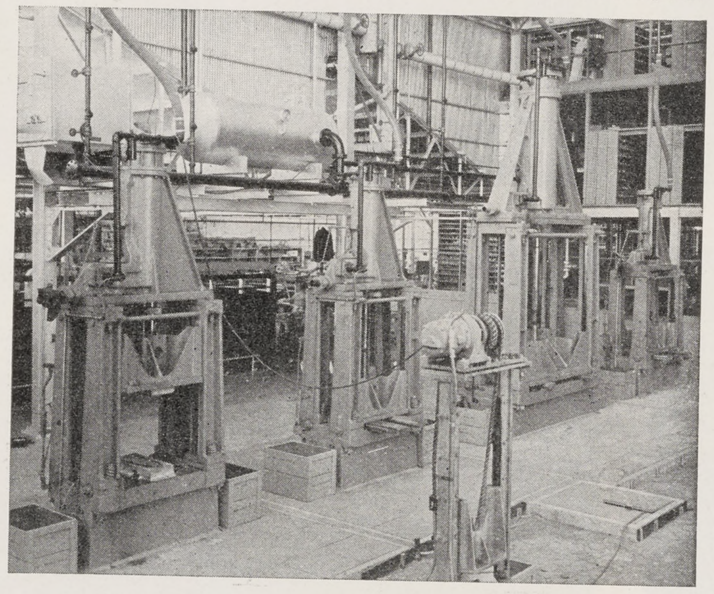
Aircraft jigs and fixtures have always represented a special problem. Quantities have rarely justified development of permanent jigs, with durable steel fixtures and locating blocks. But wood jig parts, however satisfactory for assembly of a few planes, have not been satisfactory for production in quantities of fifty or more, due to cracking, chipping, swelling, wear, etc. Consolidated has solved this problem by melting up all aluminum alloy scrap and casting it into standard shapes and sizes suitable for use in jig and fixture work. Where very large jig parts are needed, for location of wing to fuselage, etc., a single member can be conveniently cast in the alloy metal. This metal is relatively easy to machine and work

(*Turn to page 102*)

This Birdsboro — HPM press has a 48 in. working stroke, a platen area 140 x 118 in. and a total weight of 610,000 lb.



These new penumatic drop hammers are mounted on inertia blocks supported on coil springs and specially driven steel piles.



Consolidated

(*Continued from page 46*)

with the net result that at little more than the cost of wood parts the production line is fitted with metal fixtures and jig parts that are every bit as satisfactory as steel for the limited runs produced on them.

As metal has supplanted other materials in airplane construction the machine shop has become the heart of aircraft production. At Consolidated 85 per cent of all machine work is performed in the company's own machine shops. Tool room and production machine shop work more or less interchangeably, the tool room shifting over to production machine work as tooling is completed for a major manufacturing run on a single model. So important is the elimination of lost time between design and delivery that production of a new type is usually started through the machine shop simultaneously with tool and fixture orders that go to the tool shop. As special fixtures and jigs become available they are placed in the production line, but production does not wait on them.

Tool room equipment ranges in size and character from the huge Cleveland planer with 30-ft. bed to the Societe Genevoise (Swiss) jig borer used on precision jig work. Most blanking dies are made on the DoAll Metalmaster from ⅛ in. crucible steel sheet, with a hardened punch ⅛th in. thick, at a cost one-third that of the conventional blanking die. It is economical to make such dies for production runs as small as thirty parts. Other special tool room equipment includes a Pratt & Whitney surface grinder, a Fosdick Radial for large jig and fixture work, and the usual battery of lathes, mills, shapers, etc.

Sheet metal shop equipment includes a Cincinnati brake with a 10 ft. throat, which may be extended to 15 ft. by end brackets used in connection with light alloy work; and a Cincinnati shear with a 14 ft. throat, used for trimming and external profiling of large sheet metal blanks. A battery of Niagara punch presses handles a multitude of blanking, forming, drawing, joggling, notching, perforating, nipping, dimpling, crimping, slotting, and burnishing operations, and even some small shear work. In order to get maximum use of the punch presses an ingenious system of dies has been developed, including spring die sets, magnetic die holders, notching and slotting dies held in special die sets, and a fascinating technique in handling joggling dies. Joggling, offsetting, or crimping, is of special importance in joggling or off-setting plate, sheet, or extruded or drawn sections in order properly to assemble certain complex fittings in an aircraft structure. A clever system of joggle dies, using a sliding shoe and return springs, serves to convert the vertical motion of the punch press into a desired transverse and angular motion to achieve the various degrees of joggle required.

Big Amphibian Flying East

A 14-ton amphibian navy patrol bomber left naval air station at 7:20 a.m. yesterday for Washington. The craft, said to be the world's largest amphibian, was in command of Lt. Carl E. Giese of the Anacostia naval air station, with Lt. Roy Jackson of La Mesa co-pilot.

Built by Consolidated Aircraft Corp. for the bureau of aeronautics, the huge flying boat is being flown to Washington for final acceptance tests.

Lt. Geise planned to remain over night at San Antonio and will continue to Washington today via Pensacola.

Union 12-15-39

Air Squadron to Get Schiff Trophy Here

In a colorful ceremony at the Naval Air station at 9:30 a.m. tomorrow, Capt. Charles P. Mason, commander Patrol Wing 1, will present a replica of the famed Schiff trophy to Lt. Comdr. S. B. Moore, commander squadron VP-11.

The squadron was awarded the Schiff trophy for flying the greatest number of hours without an accident during the last fiscal year. Because of Comdr. Moore's illness President Roosevelt presented the original trophy to Lt. Comdr. Frank T. Ward, squadron executive officer, at a White House ceremony last month.

Doctors at the Naval hospital have granted permission to Comdr. Moore to attend tomorrow's ceremonies.

'American Fighting Planes Can't Fight In Big League'

'Statement Requires Many Qualifications,' Says Ingersoll, Who Waited to Write This Until He Checked Facts Here

tions to make. (From Page One)

THESE IMPORTANT QUALIFICATIONS

First—As far as our own national defense goes, it is probably not necessary that we ever produce the best interceptor fighter in the world. Because the best interceptor fighter is a highly specialized plane necessary for defense only when the attacking bombers are themselves accompanied by fighter planes—a situation highly unlikely in the U. S. A., which would first have to be attacked by bombers flying such long distances that their protection by enemy fighters would be impractical. Our planes can shoot down unaccompanied bombers.

Second—Just as shock troops are at most a small percentage of any army, so the fastest and most lethal fighter planes are a small percentage of any air force. And if we have no aerial shock troops which can fight alongside the R. A. F. against the Luftwaffe, the planes the British are getting from us are anything but useless—serve in doz-

GIVEN ADEQUATE FIGHTERS, THIS CANNOT HAPPEN

As long as the R. A. F. fighter continues to lick the Luftwaffe fighting plane this cannot happe But unless and until Americans ca produce a fighting airplane th specifications of which I will pres ently describe, the R. A. F. must g on relying on British-built plane And in such a war as is bein fought over England, it is not th British that need American help but the Americans that need British help—in manufacturing a fighting machine that can fight in the big league.

So much for American fighter Now about American bombers. Any plane that can carry a large load a long way is useful as a bomber. For bombing at night it is not even necessary that the plane fly fast. But a first class bomber is a bomber that not only can carry a large load of bombs to its objective, but one which can defend itself from attack by enemy planes. In this respect, the best American bombers now produced still ars as woefully deficient as the best American pursuit ships now in England.

AMERICAN BOMBERS WEAK ON DEFENSE

This will not long be so, because we are now incorporating in our bomber designs defensive devices developed by the British. But it is true at present, and the generalization goes not only for the flying fortresses, but for every other American bombing plane, light and medium as well as heavy, now going to Britain.

The defensive device referred to

greater numbers, despite what bombing the Germans can do by night, they do not feel an acute need for help from us in this de-

cations to the flat statement that our best planes cannot compete with the best English and German planes, this sole fact is not the whole story. First-hand descriptions of what I saw and heard in England follow this article. I think they will make both the indictment and its qualifications clearer to you.

Let's begin by visiting the front line trenches of the air—the airport from which the interceptor squadrons take off, the fighter station. We go tomorrow.

Navy Experimental Plane Lands

WASHINGTON, Dec. 16 (UP)—The navy's experimental amphibian plane, the XPBY-5A, landed today at Anacostia naval air station after a flight of five hours and fifteen minutes from Pensacola. The ship, which will undergo a series of tests at Anacostia, left San Diego, Calif., on its transcontinental flight Thursday. It flew to Randolph Field, Texas, Thursday, and to Pensacola yesterday. The plane, built by Consolidated Aircraft Corporation, is powered by twin Wasp engines in the wings. It has a 104-foot wingspread, and is 65 feet long. It is commanded by Lieut. Comdr. C. E. Giese.

DEC 13 1939

Huge Amphibian Plane To Be Flown Across U.S.

Navy Will Test Mysterious XPBY-5A This Week

SAN DIEGO, Calif., Dec. 12 (UP).—The Navy will test the mysterious XPBY-5A, the largest amphibian airplane in the world, in a cross-country flight this week.

At 8 a. m. Thursday the plane will swoop up from the water of San Diego Bay, or else fly off the flat ground of the North Island Naval Base—it can do either equally well—and fly to Anacostia Naval Air Station at Washington.

Details and size of the huge plane were not made public. The builders, Consolidated Aircraft Corporation, declare, however, that it will operate efficiently both over land and sea and will be especially useful in remote areas where floating aircraft tenders and good airdromes are not available. Such areas are the new naval bases in Alaska and the West Indies, where rough water landings and take-offs are routine. The plane can take off from the ocean, fly across land and water and land on an airdrome.

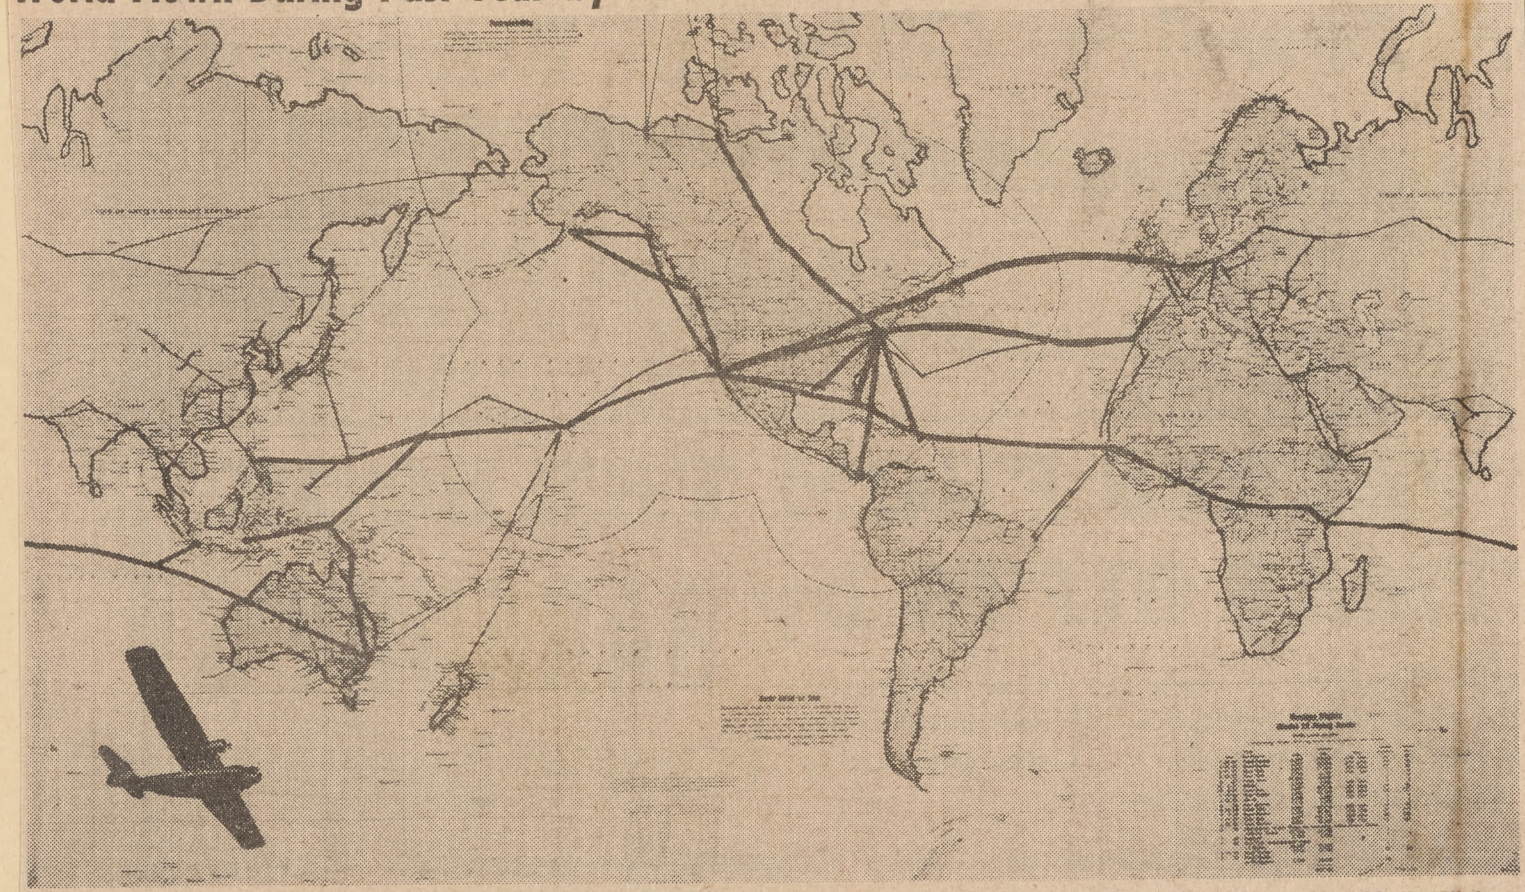
World Flown During Past Year by Consolidated-Built Aircraft



Consolidated-built planes have flown the world, as indicated by the accompanying map showing their routes. Richard Archbold's flying boat, the "Guba" ("Sudden Storm") made a round-the-world flight, while navy planes built by the firm have flown from here to Panama, Hawaii, the Philippines and Alaska. Other Consolidated-built planes have made many crossings of the Atlantic. One flew the polar wastes to look for missing Russian transpolar fliers.

PLANT HITS PEAK IN EMPLOYMENT OF SKILLED HELP

By HAROLD OSBORNE

"Wings over America" in 1939, a year marked by unprecedented aviation expansion in this country, brought Consolidated Aircraft Corp. an increase in orders for army and navy planes which has resulted in an increase in employment at the local factory of approximately 200 percent from April until December, officials at the plant report. Consolidated's 1939 "employment curve" shows a steady growth from slightly more than 1100 the latter part of March to approximately 3200 by Dec. 1.

Aviation History Made

In addition to the new army and navy plane orders received this year and climaxed today by the navy's award of a $20,016,699 contract for an unspecified number of aircraft, 1939 was highlighted at Consolidated by the launcing of new, larger model planes and by a 5750-mile flight from here to Felistowe, Eng., of a 15-ton plane. There also were several score flights by navy patrol planes ranging from PBY flights during the fleet maneuvers in the Caribbean last winter to flights from here to Honolulu and Coco Solo and from Honolulu to the Philippine islands. In June, Richard Archbold's Consolidated-built flying boat, the Guba, landed on San Diego bay, completing a voyage around the world.

Naval aviation history was made in January at the start of the annual fleet maneuvers when a mass flight of 48 Consolidated-built patrol bombers was made from San Diego to Coco Solo, C. Z., a distance of 3087 miles, which was covered in 25 hours, 43 minutes. Number of officers and men making this flight was 336. The planes later flew from the Canal Zone to successfully carry on extensive flight operations with the fleet in the Caribbean.

In June, 15 Consolidated-built patrol bombers flew from San Diego to Pearl Harbor, covering 2553 miles in 16 hours, 17 minutes. A second mass flight of patrol planes was made from here to Honolulu in September, in which 14 planes participated. Later, 14 Consolidated bombers were flown 5586 miles from Honolulu to the Philippines.

The flight from San Diego to England was made with only two stops en route. A delivery flight to the British government, it took the 15-ton Model 28-5 flying boat from San Diego bay to Buffalo, N. Y., thence to Botwood, Newfoundland, and then across the north Atlantic to England.

New Flight Planned

A Consolidated plane sold to American Export Lines flew 24,935 miles in transatlantic and European survey flights between June 30 and Aug. 4. Taking off from New York on three transatlantic flights during that period, it visited points ranging from the Azores islands and Marseilles, France, to Foynes, Ireland, in preparation for commercial transatlantic service.

Archbold's Gaba, which flew from San Diego to New Guinea in June, 1938, was used for 10 months in New Guinea by the scientist-explorer and then continued on around the world to San Diego by way of Australia, the Indian Ocean, Africa and the Atlantic. It landed here July 6 this year, and now is being made ready for another scientific flight to New Guinea. Its round-the-world flight covered 24,130 miles, and was featured by its use by the Australian government in a survey flight across the Indian ocean.

With interest in expected further expansion of the Consolidated plant heightened as a result of today's huge order by the navy, Consolidated being lowest bidder on an order for navy bombers and parts which may run to $20,000,000, a summary of new army and navy planes previously placed with the firm in 1939 follows:

On March 22 the navy department awarded a $4,699,000 contract to the firm. The order came on the eve of Consolidated's last delivery of 209 twin-motored bombers of PBY-type to the navy. Under the national defense policy inaugurated this year the exact type of planes and the number were not revealed.

During April the war department awarded Consolidated an order for four-engined bombers totaling $2,880,000, with details as to number and type kept secret.

Army Orders Bombers

Consolidated's third order of the year was received Aug. 10, when the war department awarded a contract for $8,485,000 for construction of an unannounced number of four-engine army bombers. The planes in this order, it was stated by The Associated Press, are expected to approach a speed of 300 miles an hour.

The big four-motored plane which San Diegans have seen taking off and landing on the bay the last few days was turned over by Consolidated Aug. 24 to the navy. Built as the XPB2Y-1, it became the first plane to be officially recognized as a flagplane in the navy. On that date Rear Adm. Arthur B. Cook, commander of aircraft scouting force, by dispatch, removed his flag from the light cruiser Memphis and hoisted it aboard the XPB2Y-1 thereby establishing a precedent in naval history. Never before had such a flag been officially hoisted on an airplane.

Last week Consolidated's newest contribution to aeronautical progress made its appearance, when Model 28-5A, an amphibian with tricycle-type landing gear, was flown by the navy from North Island to Anacostia, D. C., for a series of test flights there. Basically a twin-engined flying boat, which the navy knows as the PBY, the new plane has the double advantage of being able to land and take off either on water or land. Incorporation of the amphibian gear as an integral part of the plane makes the field of operations of the world's largest amphibian virtually "from anywhere to anywhere on the face of the globe," officials of Consolidated declare.

Backlog of $17,000,000

Model 31, the firm's 25-ton flying boat which is capable of carrying 28 passengers across the Atlantic, was launched May 5 as a "private venture." Unlike previous experimental flying boats which were constructed by the firm under government contract, this plane was built as Consolidated's own project and was completed in the brief period of 10 months.

Consolidated now has a backlog of slightly more than $37,000,000, all in orders for the United States army and navy. So far no orders have been received for planes for foreign governments, other than the one of Model 28-5, which was delivered to the British government in July.

A spokesman for Consolidated said the firm's policy on employment is to re-employ former workers and San Diego residents whenever possible, and to employ experienced workmen as far as possible. With present orders in hand, it was said, the peak of employment has been practically reached at the plant.

The Truth About England

Pasadena Star News 12/23/40

'American Fighting Planes Can't Fight In Big League'

'Statement Requires Many Qualifications,' Says Ingersoll, Who Waited to Write This Until He Checked Facts Here

(Continued From Page One)

and the models which are about to succeed the Spitfires and the Hurricanes will mount 12—or eight machine guns plus four cannon. There are other respects in which the best American fighters compare unfavorably with the fighters of the R. A. F. and the Luftwaffe, but this is the principal one. The fighting power of a plane cannot easily be increased simply by sticking additional machine guns or cannon into it. The design of a fighting plane—which is after all nothing but a flying gun platform—must begin with its guns and the plane must be designed around them, the whole worked out to achieve the puropose of carrying the guns and their ammunition in the most effective manner.

USED AS TRAINERS OR AGAINST ITALY

The best American fighter planes already delivered to the British are used by them either as advanced trainers—or for fighting equally obsolete Italian planes in the Middle East. That is all they are good for.

Even the American R. A. F. squadron—the Eagles—then training in England, which had planned to use American Brewster Buffalo fighters, had abandoned the idea and were being outfitted with Hurricanes.

I was going to lead off with this news—because I was very shocked by what I found out from the test pilots and engineers in England and what I saw at the station where the R. A. F. tests its new models.

WAITED TO CHECK FACTS IN U. S.

I did not break the story as soon as I came back because I wanted first to check what I had seen with American experts, to find out whether the situation was really as bad as it appeared, or whether we really did have models which could compete with the best British and German fighters but which we were simply keeping to ourselves. And the situation seemed too serious to me to want to risk going off half-cocked.

After the best check I have been able to make of models either in production or planned in this country—and after conferences with authorities on military strategy—the above statement still stands, but I have several important qualifications to make.

THESE IMPORTANT QUALIFICATIONS

First—As far as our own national defense goes, it is probably not necessary that we ever produce the best interceptor fighter in the world. Because the best interceptor fighter is a highly specialized plane necessary for defense only when the attacking bombers are themselves accompanied by fighter planes—a situation highly unlikely in the U. S. A., which would first have to be attacked by bombers flying such long distances that their protection by enemy fighters would be impractical. Our planes can shoot down unaccompanied bombers.

Second—Just as shock troops are at most a small percentage of any army, so the fastest and most lethal fighter planes are a small percentage of any air force. And if we have no aerial shock troops which can fight alongside the R. A. F. against the Luftwaffe, the planes the British are getting from us are anything but useless—serve in dozens of other important capacities.

AMERICAN AUTHORITIES HAVE THE FACTS

Third—There were American military observers in Great Britain when I was there. They are at last aware of the situation and they are now bringing back first-hand reports to guide and modify our own program.

And Fourth—We have in manufacture in this country models which probably will be able to compete. I put this fact only fourth in my list of extenuating circumstances, because these newest American models will not be ready until late in the winter. They have not been tested in combat and if the history of the production of new models of airplanes teaches anything, it is that there are unforeseen imperfections and bugs in every new model which take time to be worked out. The German and English planes are not better because the German and English designers are smarter, but because their designs have been worked out and perfected under prsssure and in actual combat.

But with all these qualifications, the fact still remains that the planes that Great Britain is producing for herself in British factories under a rain of German bombs must still stand alone between England and the Luftwaffe. To date we have been wholly unable to be of any assistance to England in the most crucial phase of the crucial fight for supremacy of the air over England.

BRITAIN HOLDS OUT BECAUSE OF SUPERIORITY

In the series of articles which follow this one I will explain that the British are in business today solely by virtue of the superiority of the Hurricanes and Spitfires' over the Messerschmitts. If the Hurricane and Spitfire had not been able to defeat the Messerschmitt in combat over England, German bombers, instead of scattering bombs by night over Coventry in the dark, seeking to blow industrial needles out of residential hay stacks, groping blindly and in general ineffectually for vital targets, would long since have been blackening the air over England by day, their dive bombers would have been picking off whatever they cared to pick off, and England would long since have become another Poland bomb destroyed.

GIVEN ADEQUATE FIGHTERS, THIS CANNOT HAPPEN

As long as the R. A. F. fighter continues to lick the Luftwaffe fighting plane this cannot happen. But unless and until Americans can produce a fighting airplane the specifications of which I will presently describe, the R. A. F. must go on relying on British-built planes. And in such a war as is being fought over England, it is not the British that need American help, but the Americans that need British help—in manufacturing a fighting machine that can fight in the big league.

So much for American fighters. Now about American bombers. Any plane that can carry a large load a long way is useful as a bomber. For bombing at night it is not even necessary that the plane fly fast. But a first class bomber is a bomber that not only can carry a large load of bombs to its objective, but one which can defend itself from attack by enemy planes. In this respect, the best American bombers now produced still ars as woefully deficient as the best American pursuit ships now in England.

AMERICAN BOMBERS WEAK ON DEFENSE

This will not long be so, because we are now incorporating in our bomber designs defensive devices developed by the British. But it is true at present, and the generalization goes not only for the flying fortresses, but for every other American bombing plane, light and medium as well as heavy, now going to Britain.

The defensive device referred to is the automatic revolving machine-gun turret. It's not hard to understand the defensive superiority this turret gives. Every American has seen pictures of them—little glass cubicles housing a machine-gunner and a battery of machine guns. Hydraulically operated, the turret itself swings in a 180-degree arc. And the guns can shoot straight up to almost straight down. In other words, the turret can shoot its battery of guns in almost any direction.

The no-secret of the British bomber design is the wide tail of the fuselage, which permits the attachment of one of these turrets so that the gunner sits literally behind the whole plane and can protect it from any attack from the rear, from any direction and from above and below.' If you accept the desirability of this turret you will see at once the defect in the American design for defensive purposes by noticing how this turret has to be attached in converting the American Lockheed into a military ship—it must be stuck up in the middle of the back, like an air-resisting bump on a log. And obviously it cannot protect the plane from attacks from the rear and below.

TURRET IN NOSE, TAIL USED BY BRITISH

The standard English equipment on medium and light bombers is a turret in the nose and the tail. In the very largest bombers—even in our flying fortresses—there are additional turrets in the fuselage which retract like landing gear.

In bombing an undefended objective by night, defensive turrets are just so much waste load to carry. But already the Germans, as well as the English, have night fighters, and the British bombers over Germany have so far had a remarkable record of success in shooting down attacking night fighters. The revolving turret has been an important reason for this success.

These are the highlights of the news on "how useful are our planes to the British?" No Britisher would make these statements as flatly as I have made them. First, because since they have developed their own fighters which can beat the Luftwaffe's best, and are continuing to produce them in greater numbers, despite what bombing the Germans can do by night, they do not feel an acute need for help from us in this department. Second, because they do need all kinds of other planes—trainers, reconnaissance planes and bombers, bombers, bombers — and they are getting these from us in increasing numbers and, as I have said, our bombers are now incorporating the British revolving turret in their design.

IMPLICATIONS, HOWEVER, ARE DISQUIETING

But to an American it is shocking news that we have at this date no planes that can fight in the front line in the battle for the defense of England—and that we have yet to prove that any of our models now planned or in production ever can compete. And it's impossible not to wonder what our American designers and manufacturers were doing through the years when the Hurricanes and the Spitfires and the Messerschmitts were being developed. If a hostile power with equipment as good as this could ever establish itself a bombing base close enough to this continent to protect its bombers with fighters, there would be nothing we could do about it until we developed such a plane. And, to repeat, you cannot develop a major fighting machine over night. The Hurricanes and the Spitfires, the Messerschmitts and the still newer British and German models have been developed by a long process of trial and error, gradual and constant improvement.

WAR IN AIR HIGHLY TECHNICAL

Since I have gotten back, many, many people have asked me: What about our planes in England? Are they standing up? How do they compare? I have written these conclusions before describing what I have seen at the fighter and bomber stations in England. War in the air is complicated and highly technical. As I have tried to say in setting down my qualifications to the flat statement that our best planes cannot compete with the best English and German planes, this sole fact is not the whole story. First-hand descriptions of what I saw and heard in England follow this article. I think they will make both the indictment and its qualifications clearer to you.

Let's begin by visiting the front line trenches of the air—the airport from which the interceptor squadrons take off, the fighter station. We go tomorrow.

EXTRACT FROM

In the Air

From Hopes to Heartening Facts

By Our Flying Correspondent

IT is the great production tug-of-war. That is the unescapable reading of the German air action of the past few weeks. The Germans know we are after them in the air; they realise that our production is mounting and that soon we shall have numerical equality and then numerical superiority. They know what that means when it is coupled with technical superiority.

So they are determined to check our production. At all costs they know they must check it if they are not to be subjected in this coming year to the most devastating aerial offensive ever launched. It is the whole cause of their concentration on concentrated night bombing.

They go for our cities where there are aircraft and aero-engine factories; they go for our ports where they think that American aircraft are coming into this country.

It may be asked why they do not go more directly for our aircraft factories; why they should turn to the cities themselves and attack the workpeople rather than the works. The answer is simple. The Germans know, or at least the German high command knows, that the German airman's bombing aim at night is not too good.

The consequence is that the targets selected must be easy targets. It is no good selecting a works situated out in the country and expecting the German airmen to hit it at night. But when a city is selected it is almost certain that, however bad the aim, some damage will be done. The German high command thinks, rightly or wrongly, that that damage will affect our output through the workpeople more effectively than attempts to hit the factories direct.

> As a group of British pilots left the mess on a particularly hazardous job they found their Polish colleagues drawn up at the door. Their spokesman had in his hand an English dictionary. He stepped forward.
>
> "God pickle you, gentlemen," he said.
>
> The English language is full of pitfalls, and perhaps not the least of them concerns the words "pickle" and "preserve."

It is no use denying that to some extent the German theory holds good. When the workpeople's homes are hit, the workpeople are rendered slightly less efficient. But they are resilient in this country. They come back and work on and work harder after the bombing. That the Germans have not yet realised.

The Answer

Fundamentally it remains true, therefore, that the only way to stop an aircraft factory producing aircraft is to hit that factory and to wreck its machinery. Nevertheless, we must maintain and enhance our production, and we must not allow even the small checks that occur when the workers' homes are attacked to interrupt it.

What is the method; what is our answer to the night bombing of our workpeople in their homes and their cities? It is two-fold; first, rapid repair and full control of the transport and other facilities of those cities; and second, dispersal of productive resources, world dispersal and not just national dispersal.

British factories are well dispersed already. They are spread over the length and breadth of Great Britain and it would require more than the Nazi air force really to stop production over here. But there is more than that to it.

Factories working for our victory are not only dispersed over these small islands, but they are dispersed over a hemisphere. They are dispersed over the United States of America and the Dominions beyond the seas.

From Canada, from Australia, from New Zealand, from the United States aircraft and aero-engines pour in to these islands. Hit our factories at home, and the Dominions will gird themselves to still greater efforts and make up for the production loss here and over-top it.

Sink our ships that bring the aircraft over the water and we will fly them over. For most of the bombers of to-day can do the Atlantic flight as easily as going from Heston to Hendon before the war.

LOADING A TORPEDO into one of the Fleet Air Arm's Bristol Beauforts, one of the fastest twin-engined bombers in the world. The torpedo, which is carried inside the fuselage, has to be released from a height of only a few feet—20 feet was mentioned in connection with the attack on Taranto by Swordfish aircraft.

Inevitably the productive might of the British Commonwealth swells. Its inflow grows visibly and day by day and hour by hour. When the Nazis bomb our workpeople here, workpeople over the seas, out of range of their bombs, regard it as a matter of honour to better their previous best.

Meanwhile, what of the German production? It is very big. Nobody who knows anything about it will deny that. The German works are among the most modern in the world in lay-out and equipment. Their output capacity is formidable.

But our bombers have struck at their works in many parts. They have struck, I say, at the German works and not at the homes of the German workpeople. It is not because it is more humane that that method is better than theirs—though it is inevitably more humane—but because it is more damaging to the German war effort.

Changing Balance

So we look now coldly at the situation in the air. Our cities are being heavily bombarded by night. Those "new devices" which our elevated air officers talked so much and so prematurely about do not materialise or do not have any effect. The bombs fall.

Our workpeoples' homes are wrecked. But the works go on. Their output, however, is slightly reduced as was admitted in the House of Commons. But as their output goes down so the great arsenals of the Dominions and the United States put up their output, the balance is more than redressed; it changes in our favour.

That is the position. We suffer more and more in this country; but as we suffer so the war situation improves. We take blows, but we also begin to give them. Our production suffers; but German production suffers more and our deficiencies are more than made up from other parts of the world outside the range of the German bombers.

Look quickly at some of the aircraft we are getting from over the seas. First the great Consolidated B-24 four-engined bombing aeroplanes, mightiest bombers about which it is as yet not possible to speak freely though others are coming forward in secret.

Three hundred miles an hour, 3,000 miles and four tons of bombs is some measure of the hitting power of these aeroplanes. They can be heavily armed if heavy armament is needed—though it is clear that, until such times as the night interception problem is solved, there is not great need for heavy armament for big bombers. The Consolidated B-24 bombers are among the finest machines in their class in the world.

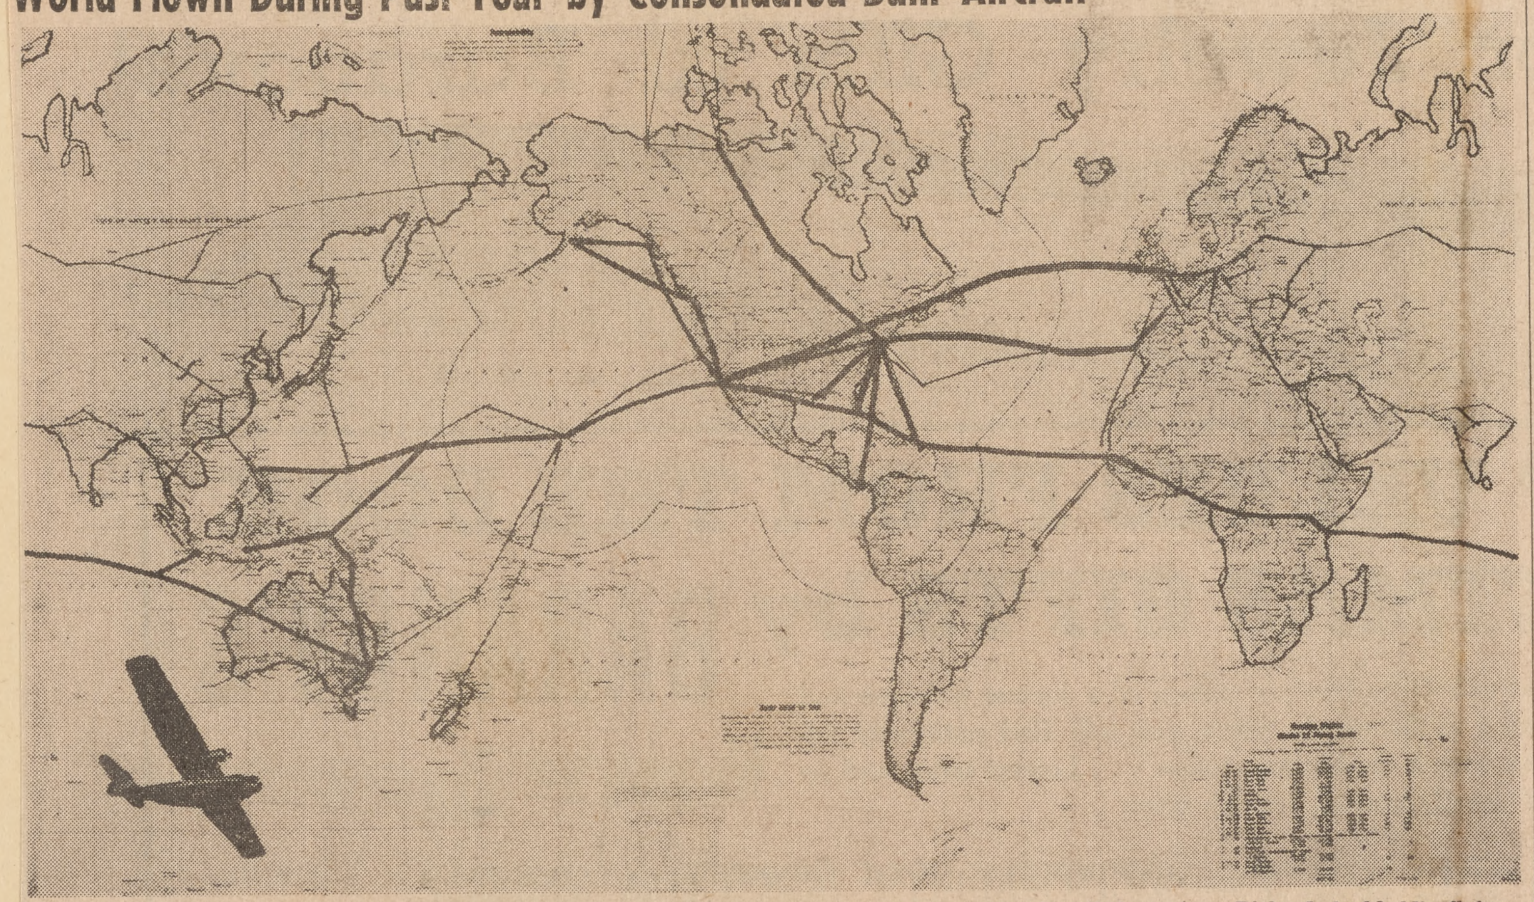
Now the new fighters, the beautiful Lockheed P-38, a twin-engined machine which delights the eye of every test pilot. Its lines are slim and its design unorthodox. It also has the tricycle undercarriage and its top speed is certainly over 400 miles an hour.

Then the Bell Airacobra, another daringly original design. Armed with the full number of guns called for to meet British standards, this is going to be an aircraft of remarkable qualities.

Other machines which will make things hum for the Nazis are the new Lockheeds, the Martin Baltimore bombers, the Curtiss Tomahawk (or P-40) fighters, the Grummans and the Boeings. Altogether a formidable crew. A selection of aircraft including some of the finest designs by the best designers in the world. What is more they are built by the best factories in the world.

PAGE EIGHT—A THE TRIBUNE-SUN, San Diego, Calif., Wednesday, December 20, 1939

World Flown During Past Year by Consolidated-Built Aircraft



Consolidated-built planes have flown the world, as indicated by the accompanying map showing their routes. Richard Archbold's flying boat, the "Guba" ("Sudden Storm") made a round-the-world flight, while navy planes built by the firm have flown from here to Panama, Hawaii, the Philippines and Alaska. Other Consolidated-built planes have made many crossings of the Atlantic. One flew the polar wastes to look for missing Russian transpolar fliers.

PLANT HITS PEAK IN EMPLOYMENT OF SKILLED HELP

By HAROLD OSBORNE

"Wings over America" in 1939, a year marked by unprecedented aviation expansion in this country, brought Consolidated Aircraft Corp. an increase in orders for army and navy planes which has resulted in an increase in employment at the local factory of approximately 200 percent from April until December, officials at the plant report. Consolidated's 1939 "employment curve" shows a steady growth from slightly more than 1100 the latter part of March to approximately 3200 by Dec. 1.

Aviation History Made

In addition to the new army and navy plane orders received this year and climaxed today by the navy's award of a $20,016,699 contract for an unspecified number of aircraft, 1939 was highlighted at Consolidated by the launcing of new, larger model planes and by a 5750-mile flight from here to Felistowe, Eng., of a 15-ton plane. There also were several score flights by navy patrol planes ranging from PBY flights during the fleet maneuvers in the Caribbean last winter to flights from here to Honolulu and Coco Solo and from Honolulu to the Philippine islands. In June, Richard Archbold's Consolidated-built flying boat, the Guba, landed on San Diego bay, completing a voyage around the world.

Naval aviation history was made in January at the start of the annual fleet maneuvers when a mass flight of 48 Consolidated-built patrol bombers was made from San Diego to Coco Solo, C. Z., a distance of 3087 miles, which was covered in 25 hours, 43 minutes. Number of officers and men making this flight was 336. The planes later flew from the Canal Zone to successfully carry on extensive flight operations with the fleet in the Caribbean.

In June, 15 Consolidated-built patrol bombers flew from San Diego to Pearl Harbor, covering 2553 miles in 16 hours, 17 minutes. A second mass flight of patrol planes was made from here to Honolulu in September, in which 14 planes participated. Later, 14 Consolidated bombers were flown 5586 miles from Honolulu to the Philippines.

The flight from San Diego to England was made with only two stops en route. A delivery flight to the British government, it took the 15-ton Model 28-5 flying boat from San Diego bay to Buffalo, N. Y., thence to Botwood, Newfoundland, and then across the north Atlantic to England.

New Flight Planned

A Consolidated plane sold to American Export Lines flew 24,935 miles in transatlantic and European survey flights between June 30 and Aug. 4. Taking off from New York on three transatlantic flights during that period, it visited points ranging from the Azores islands and Marseilles, France, to Foynes, Ireland, in preparation for commercial transatlantic service.

Archbold's Gaba, which flew from San Diego to New Guinea in June, 1938, was used for 10 months in New Guinea by the scientist-explorer and then continued on around the world to San Diego by way of Australia, the Indian Ocean, Africa and the Atlantic. It landed here July 6 this year, and now is being made ready for another scientific flight to New Guinea. Its round-the-world flight covered 24,130 miles, and was featured by its use by the Australian government in a survey flight across the Indian ocean.

With interest in expected further expansion of the Consolidated plant heightened as a result of today's huge order by the navy, Consolidated being lowest bidder on an order for navy bombers and parts which may run to $20,000,000, a summary of new army and navy planes previously placed with the firm in 1939 follows:

On March 22 the navy department awarded a $4,699,000 contract to the firm. The order came on the eve of Consolidated's last delivery of 209 twin-motored bombers of PBY-type to the navy. Under the national defense policy inaugurated this year the exact type of planes and the number were not revealed.

During April the war department awarded Consolidated an order for four-engined bombers totaling $2,880,000, with details as to number and type kept secret.

Army Orders Bombers

Consolidated's third order of the year was received Aug. 10, when the war department awarded a contract for $8,485,000 for construction of an unannounced number of four-engine army bombers. The planes in this order, it was stated by The Associated Press, are expected to approach a speed of 300 miles an hour.

The big four-motored plane which San Diegans have seen taking off and landing on the bay the last few days was turned over by Consolidated Aug. 24 to the navy. Built as the XPB2Y-1, it became the first plane to be officially recognized as a flagplane in the navy. On that date Rear Adm. Arthur B. Cook, commander of aircraft scouting force, by dispatch, removed his flag from the light cruiser Memphis and hoisted it aboard the XPB2Y-1 thereby establishing a precedent in naval history. Never before had such a flag been officially hoisted on an airplane.

Last week Consolidated's newest contribution to aeronautical progress made its appearance, when Model 28-5A, an amphibian with tricycle-type landing gear, was flown by the navy from North Island to Anacostia, D. C., for a series of test flights there. Basically a twin-engined flying boat, which the navy knows as the PBY, the new plane has the double advantage of being able to land and take off either on water or land. Incorporation of the amphibian gear as an integral part of the plane makes the field of operations of the world's largest amphibian virtually "from anywhere to anywhere on the face of the globe," officials of Consolidated declare.

Backlog of $17,000,000

Model 31, the firm's 25-ton flying boat which is capable of carrying 28 passengers across the Atlantic, was launched May 5 as a "private venture." Unlike previous experimental flying boats which were constructed by the firm under government contract, this plane was built as Consolidated's own project and was completed in the brief period of 10 months.

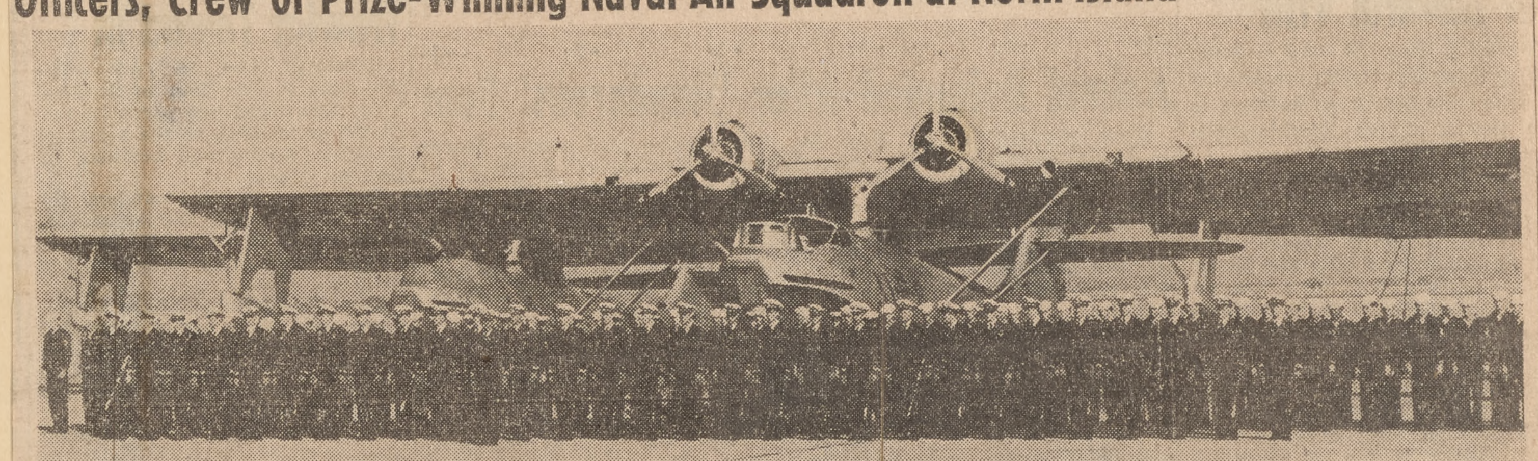
Consolidated now has a backlog of slightly more than $37,000,000, all in orders for the United States army and navy. So far no orders have been received for planes for foreign governments, other than the one of Model 28-5, which was delivered to the British government in July.

A spokesman for Consolidated said the firm's policy on employment is to re-employ former workers and San Diego residents whenever possible, and to employ experienced workmen as far as possible. With present orders in hand, it was said, the peak of employment has been practically reached at the plant.

THE TRIBUNE-SUN, San Diego, Calif., Wednesday, December 20,

Trib. Sun Dec. 20. 39.

Officers, Crew of Prize-Winning Naval Air Squadron at North Island



Officers and men of Squadron VP-11, winner of the Herbert Schiff memorial trophy awarded annually to the squadron having the greatest number of hours in the air during the fiscal year without accident, are shown here lined up in front of squadron planes at North Island. A replica of the trophy recently was presented Lt. Comdr. S. B. Moore, the squadron commander, by Capt. Charles P. Mason, commander of Patrol Wing 1. The 12 winning planes had a total flight time of 4903 hours in the last fiscal year.

Consair Gets $20,016,699 Bomber Order

New Buildings Will Double Size of Plant

Bringing the total backlog of orders to more than $40,000,000, the greatest in the history of the company, Consolidated Aircraft Corp., yesterday received a $20,016,699 contract for the construction of an undisclosed number of PBY-5 type long-range twin-motored patrol bombers from the navy department.

Yesterday's contract was the largest order for a single type of plane ever awarded by the navy. It brought the total amount expended by the government for Consolidated PBY-type bombers, including engines, equipment and armament, to $70,000,000.

WORK STARTS TODAY

The company, it was assumed here, has entered into a satisfactory agreement with the navy department whereby part of the cost of construction of new buildings will be borne by the government.

Consolidated officials announced that work will start today in construction of buildings which virtually will double the size of the existing plant. Orders for $500,000 of new machinery have been placed.

The present personnel of 3000 employes is to be expanded to 7000 when the new additions are working to capacity. New men will be taken on gradually as the various buildings are completed and machinery installed.

TRACT LEASED

A strip of land 1700 feet long, 260 feet wide and embracing a total of 17 acres, recently leased for 50 years by the harbor department to Consolidated, will be the site of the new plant additions.

The assembly shop, said by Consolidated officials to be the largest in the world, will be 720 feet long, 360 feet wide with a 120-foot clearance span, a graphic example of the immense size of the new planes which ultimately will be built here. This huge building will front on Pacific highway immediately north of the present plant.

The auxiliary service building, to be situated immediately westward of the factory, will be 1000 feet long and 30 feet wide. It will have facilities for expediting final

(Continued on Page 2, Col. 1)

Consair Gets $20,016,699 Bomber Order

(Continued from Page 1)

assembly out-of-doors and will make the Consolidated plant unique among the world's aircraft manufacturing plants.

NEW PAINT SHOP

There will be large additions to the existing paint shop and the experimental engineering and warehouse buildings. The paint shop will be 200 by 120 feet.

Consolidated authorities were aware several weeks ago that the new contract would be forthcoming and signed contracts for delivery of the fabricated steel for the various new buildings.

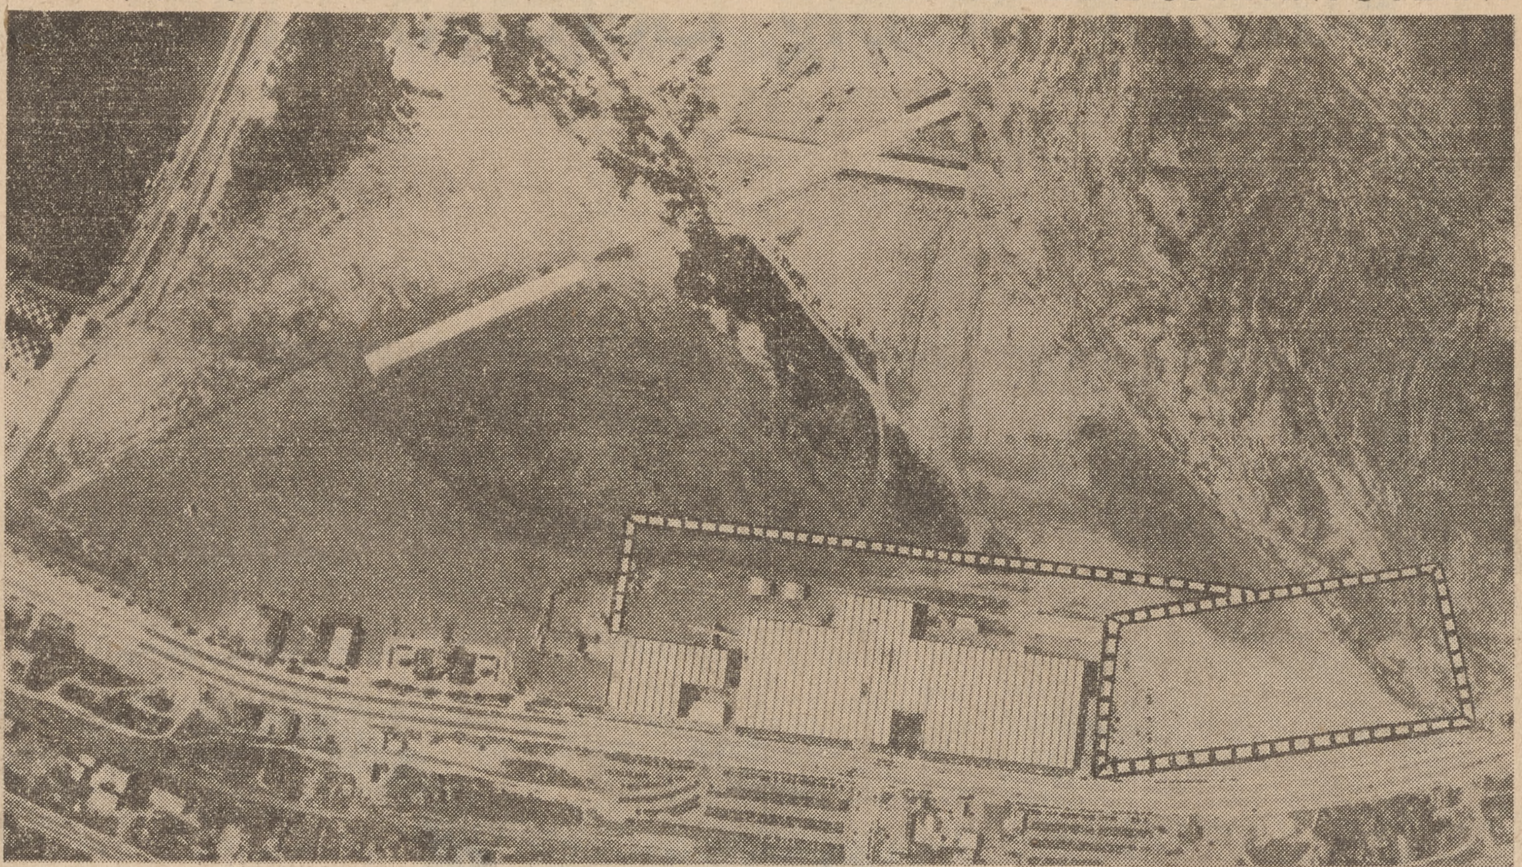
The structures will be completed in various stages, the first unit to be ready for occupancy within 90 days.

BACKLOG GROWS

Indicative of the tremendous expansion of the nation's aircraft industry since the outbreak of the European war, the total backlog of San Diego's three aircraft plants—Consolidated, Solar and Ryan—now exceeds $43,000,000 for planes and aircraft equipment, and $223,000,000 for all the plants situated in southern California.

Many of these planes are being built for the British, French and Chinese governments, but the majority are fighting craft for the U. S. army and navy.

NEW $2,500,000 BUILDINGS WILL DOUBLE SIZE OF AIRPLANE COMPANY'S PLANT



Air view of Consolidated plant at the municipal airport, showing area to be occupied by new $2,500,000 buildings and equipment. In addition to the 17 acres outlined, the harbor department has granted Consolidated an option on 15 additional acres for further plant expansion.

Trib. 12-22-39 ~~Union~~

Order New Steel For Consair Plant

In preparation for the 1940 start in construction work on new buildings for the Consolidated Aircraft Corp., in a plant expansion necessitated by a $20,016,699 contract received this week by the firm for navy patrol bombers, orders for structural steel amounting to $350,000 have been placed, Consair officials reported today. Steel now is being fabricated and erection of framework is expected to be started about Jan. 25.

Contracts for structural steel have been placed with San Diego and

(Continued on Next Page, Col. 4)

Place Steel Orders For Consair Plant

CONTINUED FROM PAGE ONE

Trib ~~Union~~ 12-22-39

Los Angeles contractors, it was reported and by Wednesday the firm will be ready to place a contract for pile driving, necessary because of the large size of the assembly shop, 720 feet in length and 360 feet wide, which is to be erected. The shop, which will be one of the largest in the world, will have a 120-foot clearance span, and will front on Pacific highway, just north of the present plant.

No order has been placed yet for excavating, it was said, although work of moving the plant's west boundary fence has started. It will be moved 260 feet out from its present location.

Doubling Payroll, Plan

With $250,000 already placed, orders for machinery, equipment and small tools up to $500,000 are to be placed soon, it was reported.

A spokesman for Maj. R. H. Fleet, Consair president, returning here tomorrow from Washington, D. C., where he has conferred with government officials, said that, with orders for planes now on hand, it is expected the present personnel of 3000 employes will be expanded gradually to approximately 7000 when the new additions are completed, several months from now, and are working to capacity. Additional employes, he said, will be taken on gradually, as various buildings are completed and machinery installed.

Work on the first new unit, an addition to the experimental building located at the south of the main building, is expected to be finished in about 90 days' time. The addition will replace a temporary shed now adjoining the experimental building.

Turkeys Assured For Consair Workers

Trib ~~Union~~ 12-22-39

Every employe of Consolidated Aircraft Corp. today was assured of the chance for a turkey dinner Christmas day, officials of the firm reported. In keeping with Consolidated's annual custom, a check for $5 was presented each person working at the plant. Latest figures on the Consolidated payroll are that approximately 3200 now are employed there.

NEWS from AUSTRALIA

Scientific Work : More Consolidateds : Gipsy Engines

SOME progress is being made in aeronautical research work under the Council for Scientific and Industrial Research (C.S.I.R.), the laboratory now being constituted the Division of Aeronautics and taking its place alongside the other Divisions of Animal Health and Forest Products. Mr. L. P. Coombes, formerly of Farnborough, is in charge.

The aerodynamics section has nearly completed its wind tunnel, but the supply of motor and airscrew from England may be delayed. The engine section has its C.F.R. engine for fuel research, and the structures and materials section has all its testing machines calibrated and working. Problems which are at present being worked upon are the use of an Australian timber for use in aircraft and the manufacture of Australian plywood. This is likely to be a fruitful subject for research as already there are difficulties about the supply of light alloys from U.S.A. and thoughts are turning to timber.

A research officer of the New South Wales Forestry Commission commented on the tests of local timber thought likely to be of use in aircraft production. A wood had been found which was a little heavier than imported spruce but was mechanically better. Large supplies were available, and it could be obtained in logs up to 60ft. long. It was one of the lowest-priced timbers on the market. The Air Board has asked the Aircraft Production Commission if it would be practicable to build a wooden twin-engined training aeroplane in Australia, to supplement supplies of aircraft from overseas.

A re-classification of positions has been made in the Department of Civil Aviation. Unofficial sources state that the position of Chief Aeronautical Engineer (which corresponds closely to the former Superintendent of Aircraft)

AUSTRALIA'S AERONAUTICAL LABORATORY: The newly completed building of the Aeronautical Division of the Council for Scientific and Industrial Research, at Melbourne.

This new development in Australian industry has called for the conversion from an automobile technique to that of aero engine precision, and some idea can be gleaned of the immensity of this task when it is learned that an agricultural implement manufacturer produced the camshaft. This camshaft is hollow and the manufacturing operation is similar to that required for the production of rifle barrels. With the aid of munitions engineers, this firm produced a praiseworthy job.

Every part of the engine is subjected to a critical examination before it is passed for assembly. The crankcase is X-rayed for material segregations, casting faults and internal cracks. All parts are put through an electric crack-detector for surface cracks, while one engine in fifty undergoes a fifty-hour type test on the bench. This engine is then completely dismantled and checked, reassembled, and given one hour's acceptance test before delivery.

An outstanding achievement in the production of this Gipsy engine in Australia was the connecting rods. These were a perfect job, and were the first of their kind ever commercially produced in Australia, being a machined aluminium-alloy forging. All this work has been developed

CAPT

CONSAIR GETS $20,016,699 JOB

Signals 'Go' On Doubling Size of Plant

The navy department has awarded a new $20,016,699 contract for airplanes to the Consolidated Aircraft Corp., Consair authorities announced today. No official details were released as to the number or type of aircraft involved, but it was believed that the contract specified latest developments of the local plant's famed PBY patrol bomber series.

A complete resume of the year's activities at the Consolidated Aircraft Corp. plant may be found on Page 8-A.

The huge order brings the Consolidated backlog of military plane orders to approximately $37,000,000, placing it securely among aviation's "big four," plant spokesmen said. More than 3000 workers now are employed on an earlier navy contract totaling $5,000,000 and an army contract for $12,000,000.

Get Acreage for Expansion

Maj. R. H. Fleet, Consolidated head, was in Washington concluding details of the contract, but local spokesmen said they assumed plant expansion plans, already announced, would be carried out in the immediate future.

Consolidated recently leased 17 acres adjacent to the Lindbergh field plant and obtained an option, containing no termination clause, on an additional 30 acres. Under terms of the lease, which runs concurrently with that covering the acreage upon which the existing plant is located, Consair will pay a "nominal" rental. The leases have 45 years to run, Joe Brennan, port director, stated.

Building Cost $2,500,000

In order to handle the additional navy order, it was expected that Consair would widen the present factory building by some 250 feet

(Continued on Next Page, Col. 6)

Consolidated Gets $20,000,000 Navy Plane Contract

About Dec. 20-39

Closing Agreement Signed With Treasury Stipulates Method of Computing Costs

Wash D.C. paper (?)

Lifts Backlog to $37,000,000

WASHINGTON — Consolidated Aircraft Corp. of San Diego, Calif., was awarded a contract for airplanes totaling $20,016,699 by the Navy Department.

The new contract increases company's backlog of unfilled orders to approximately $37,000,000 consisting almost entirely of U. S. Army and Navy orders. Consolidated has not as yet participated in any of the large foreign business placed in this country during 1939, but reports indicate that Great Britain is considering the purchase of 50 long-range patrol bombers.

Treasury Signs Closing Agreement

Secretary Morgenthau announced that the Treasury has signed a closing agreement with Consolidated Aircraft which stipulates how certain items may be handled in computing the company's costs on a Navy Department contract which is subject to the profit limiting provisions of the Vinson-Trammell act as amended by the national defense act.

The closing agreement provides that for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed. It also permits the company to charge off similarly the depreciated cost, less salvage value, of certain buildings which are necessarily required to be demolished in order for the company to carry out the contract. Cost of making the demolition is likewise allowed as a chargeoff.

No Fixing of Depreciation Rates

With respect to any buildings, machinery, or other similar facilities which may be acquired in order to perform the contract, the closing agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction for whatever part is permanently discarded upon the contract's completion. The allowance for cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and the salvage value at that time.

The deductions allowed are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

The Consolidated agreement is the second executed by the Treasury under the profit limit law. First agreement was made with Colts Patent Fire Arms Manufacturing Co.

NAVY ORDERS PLANES TO COST $20,000,000

N.Y. Times 12-21-39

Consolidated Signs Agreement Covering Production Charges

+ x

Special to THE NEW YORK TIMES.

WASHINGTON, Dec. 20—A $20,016,669.60 Navy Department airplane contract was awarded today to the Consolidated Aircraft Corporation of San Diego, the second subject to the 12 per cent profit-limiting provisions of the Vinson-Trammell Act as amended by the National Defense Act. At the same time the Treasury Department stated that it had signed an agreement stipulating how some items may be handled in computing costs.

The agreement provides that, for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed during the performance of the contract.

It also provides that the company may charge off as an indirect factory expense the depreciated cost, less salvage value, of buildings which must be demolished in order for the company to carry out the contract. The cost of making the demolition is also to be charged as an indirect factory expense.

With respect to any buildings, machinery, or other similar facilities which must be acquired by the company to perform the contract, the agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction with respect to the portion permanently discarded upon completion of the contract.

The allowance permitted with respect to the cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and for the salvage value at that time.

The deductions allowed with respect to these new facilities and the demolition of old facilities are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

HUNDRED EXCEEDED IN NAVY ORDER FOR CONSAIR PLANES

The navy department, in an official announcement, has revealed that the $20,016,669 contract for warplanes awarded last week to Consolidated Aircraft Corp. calls for construction of more than 100 PBY-5 patrol bombers.

The PBY-5 was described as being an advanced model of earlier PBY's, the big flying boats which have blazed ocean trails for the navy in a series of spectacular mass flights, most of which began here.

The new planes will have a cruising range of from 4000 to 5000 miles. Each will be powered with two 14-cylinder, 100-horsepower Pratt & Whitney engines, turning three-bladed propellers. They will have a wingspan of 104 feet, the hulls will be 65 feet long and 18½ feet high and each will weigh 12 tons. They will be flown by crews of seven officers and men.

Completion of the contract will bring into service more than 300 planes of the PBY class. They are designed to patrol the navy's far-flung sae lanes between mainland and Pacific island bases and to reinforce hemisphere defense policies, The Associated Press reported.

BIG NAVY AIR BOATS TO PATROL PACIFIC

Dec 24-39

Fifty Giant Craft Reported Involved in $20,016,669 Order to California Plant

N.Y. Times

By The Associated Press.

WASHINGTON, Dec. 23—The navy has ordered a fleet of giant, long-range, four-motor flying boats to patrol its far-flung "line of observation" in the Pacific and to reinforce the Administration's hemisphere defense policies.

Authoritative sources reported today that possibly fifty or more craft with a range of more than 5,000 miles were involved in the $20,016,669 order, the largest single aircraft contract in navy history, which went to the Consolidated Aircraft Corporation, San Diego, Calif., on Dec. 20. In accord with the navy's policy details were withheld.

The newest additions will augment fifteen other four-motor ships of the same general type ordered last year, and more than 200 smaller two-motor flying boats already in service.

The two-motor patrol craft have been "ferried" nonstop by the score to Hawaii and Panama and have been termed by foreign aviation experts "incomparably" the most formidable overseas striking force of the kind in existence.

Experimental Model a Monoplane

The navy has been experimenting with four-motor flying boats since 1935. The newest planes ordered are a development of the consolidated concern's experimental model, PB2Y2, a high wing monoplane with four 1,000-horsepower 14-cylinder motors. This plane weights about 30 tons, has a 118-foot wingspread and carries a crew of nine.

The unofficial estimate that fifty or more were involved in the $20,016,669 order was based on the cost of those contracted for last year. President Roosevelt asked Congress for $3,875,000 for nine four-motor navy planes, in addition to six provided for in the 1939 budget, so that their unit cost was $430,000 each. It is understood that the unit cost was reduced in the new, larger order.

Both army and navy are experimenting meanwhile with still more giant craft.

The army, seeking to extend the range and load capacity of its bombers, intends to build five planes nearly twice the size of its present seventeen-ton, four-motored bombers. About $4,000,00 was included in pending budget estimates for craft to weigh about thirty-five tons and capable of non-stop flights of well over 5,000 miles.

A single thirty-four-ton bomber, the B-15, has been making experimental flights for the last two years. It took medicines to Chile after an earthquake early this year.

Fifty-two of the four-motor seventeen-ton "fortress" bombers, such as have made round trip good-will flights to South America, were in service or on order when the $300,000,000 Air Corps expansion program was voted by Congress last year.

In recent months orders for a somewhat larger number were divided between two Pacific Coast plants.

Further, the War Department estimates turned over to President Roosevelt are understood to have included provision for 200 bombers of all types, of which a large proportion presumably would be of four motors.

The newest models turned over to the Air Corps are capable of top speeds of more than 300 miles an hour and they can carry five tons of bombs each, aviation circles understand.

To increase their range and power still further, the Air Corps is helping finance experiments with a forty-two-cylinder motor.

Union 12-21-39

Consair Gets $20,016,699 Bomber Order

New Buildings Will Double Size of Plant

Bringing the total backlog of orders to more than $40,000,000, the greatest in the history of the company, Consolidated Aircraft Corp., yesterday received a $20,016,699 contract for the construction of an undisclosed number of PBY-5 type long-range twin-motored patrol bombers from the navy department.

Yesterday's contract was the largest order for a single type of plane ever awarded by the navy. It brought the total amount expended by the government for Consolidated PBY-type bombers, including engines, equipment and armament, to $70,000,000.

WORK STARTS TODAY

The company, it was assumed here, has entered into a satisfactory agreement with the navy department whereby part of the cost of construction of new buildings will be borne by the government.

Consolidated officials announced that work will start today in construction of buildings which virtually will double the size of the existing plant. Orders for $500,000 of new machinery have been placed.

The present personnel of 3000 employes is to be expanded to 7000 when the new additions are working to capacity. New men will be taken on gradually as the various buildings are completed and machinery installed.

TRACT LEASED

A strip of land 1700 feet long, 260 feet wide and embracing a total of 17 acres, recently leased for 50 years by the harbor department to Consolidated, will be the site of the new plant additions.

The assembly shop, said by Consolidated officials to be the largest in the world, will be 720 feet long, 360 feet wide with a 120-foot clearance span, a graphic example of the immense size of the new planes which ultimately will be built here. This huge building will front on Pacific highway immediately north of the present plant.

The auxiliary service building, to be situated immediately westward of the factory, will be 1000 feet long and 30 feet wide. It will have facilities for expediting final

(Continued on Page 2, Col. 1)

Consair Gets $20,016,699 Bomber Order

(Continued from Page 1)

assembly out-of-doors and will make the Consolidated plant unique among the world's aircraft manufacturing plants.

NEW PAINT SHOP

There will be large additions to the existing paint shop and the experimental engineering and warehouse buildings. The paint shop will be 200 by 120 feet.

Consolidated authorities were aware several weeks ago that the new contract would be forthcoming and signed contracts for delivery of the fabricated steel for the various new buildings.

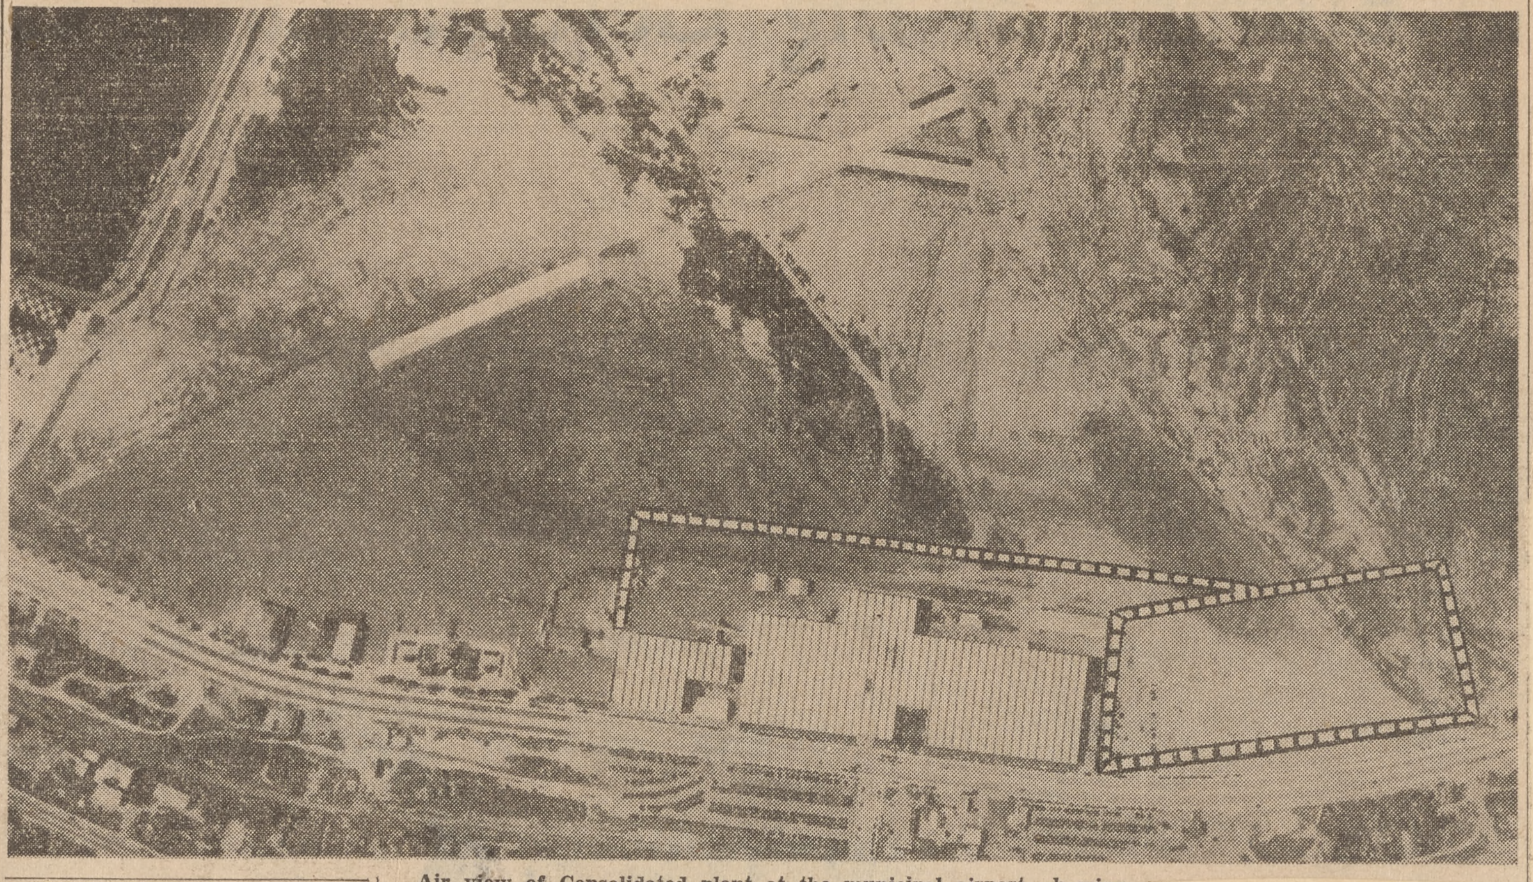
The structures will be completed in various stages, the first unit to be ready for occupancy within 90 days.

BACKLOG GROWS

Indicative of the tremendous expansion of the nation's aircraft industry since the outbreak of the European war, the total backlog of San Diego's three aircraft plants—Consolidated, Solar and Ryan—now exceeds $43,000,000 for planes and aircraft equipment, and $223,000,000 for all the plants situated in southern California.

Many of these planes are being built for the British, French and Chinese governments, but the majority are fighting craft for the U. S. army and navy.

NEW $2,500,000 BUILDINGS WILL DOUBLE SIZE OF AIRPLANE COMPANY'S PLANT



Air view of Consolidated plant at the municipal airport, showing area to be occupied by new $2,500,000 buildings and equipment. In addition to the 17 acres outlined, the harbor department has granted Consolidated an option on 15 additional acres for further plant expansion.

Trib. 12-22-39

Order New Steel For Consair Plant

In preparation for the 1940 start in construction work on new buildings for the Consolidated Aircraft Corp., in a plant expansion necessitated by a $20,016,699 contract received this week by the firm for navy patrol bombers, orders for structural steel amounting to $350,000 have been placed, Consair officials reported today. Steel now is being fabricated and erection of framework is expected to be started about Jan. 25.

Contracts for structural steel have been placed with San Diego and

(Continued on Next Page, Col. 4)

Place Steel Orders For Consair Plant

CONTINUED FROM PAGE ONE

Trib. 12-22-39

Los Angeles contractors, it was reported and by Wednesday the firm will be ready to place a contract for pile driving, necessary because of the large size of the assembly shop, 720 feet in length and 360 feet wide, which is to be erected. The shop, which will be one of the largest in the world, will have a 120-foot clearance span, and will front on Pacific highway, just north of the present plant.

No order has been placed yet for excavating, it was said, although work of moving the plant's west boundary fence has started. It will be moved 260 feet out from its present location.

Doubling Payroll, Plan

With $250,000 already placed, orders for machinery, equipment and small tools up to $500,000 are to be placed soon, it was reported.

A spokesman for Maj. R. H. Fleet, Consair president, returning here tomorrow from Washington, D. C., where he has conferred with government officials, said that, with orders for planes now on hand, it is expected the present personnel of 3000 employes will be expanded gradually to approximately 7000 when the new additions are completed, several months from now, and are working to capacity. Additional employes, he said, will be taken on gradually, as various buildings are completed and machinery installed.

Work on the first new unit, an addition to the experimental building located at the south of the main building, is expected to be finished in about 90 days' time. The addition will replace a temporary shed now adjoining the experimental building.

Turkeys Assured For Consair Workers

Trib 12-22-39

Every employe of Consolidated Aircraft Corp. today was assured of the chance for a turkey dinner Christmas day, officials of the firm reported. In keeping with Consolidated's annual custom, a check for $5 was presented each person working at the plant. Latest figures on the Consolidated payroll are that approximately 3200 now are employed there.

NEWS from AUSTRALIA

Scientific Work : More Consolidateds : Gipsy Engines

SOME progress is being made in aeronautical research work under the Council for Scientific and Industrial Research (C.S.I.R.), the laboratory now being constituted the Division of Aeronautics and taking its place alongside the other Divisions of Animal Health and Forest Products. Mr. L. P. Coombes, formerly of Farnborough, is in charge.

The aerodynamics section has nearly completed its wind tunnel, but the supply of motor and airscrew from England may be delayed. The engine section has its C.F.R. engine for fuel research, and the structures and materials section has all its testing machines calibrated and working. Problems which are at present being worked upon are the use of an Australian timber for use in aircraft and the manufacture of Australian plywood. This is likely to be a fruitful subject for research as already there are difficulties about the supply of light alloys from U.S.A. and thoughts are turning to timber.

A research officer of the New South Wales Forestry Commission commented on the tests of local timber thought likely to be of use in aircraft production. A wood had been found which was a little heavier than imported spruce but was mechanically better. Large supplies were available, and it could be obtained in logs up to 60ft. long. It was one of the lowest-priced timbers on the market. The Air Board has asked the Aircraft Production Commission if it would be practicable to build a wooden twin-engined training aeroplane in Australia, to supplement supplies of aircraft from overseas.

A re-classification of positions has been made in the Department of Civil Aviation. Unofficial sources state that the position of Chief Aeronautical Engineer (which corresponds closely to the former Superintendent of Aircraft) carries a salary of £A900 and is charged with the responsibility of directing the inspectors and aeronautical engineers. These latter are graded into two classes, with ranges of £A510-582 and £A420-510. A senior is in charge of them, with a salary of £A636-708.

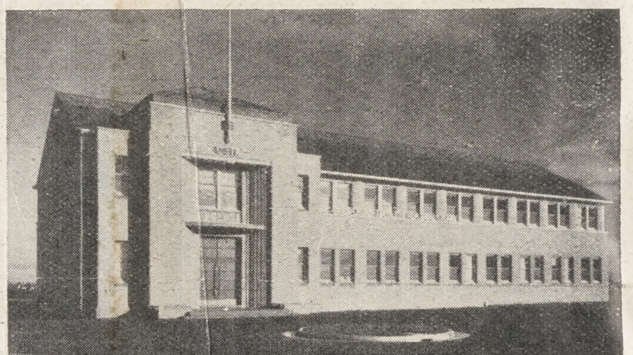
In charge of the inspecting staff is a supervising inspector on £A582-660. Senior inspectors' salaries range between £A474 and £A546. The Chief Electrical Engineer, who deals with all radio equipment and related matters, receives £A1,100, with two assistants, each on £A900.

At June 30 the following licences were in force in Australia: Private pilots, 1,225; commercial pilots, 324; flying instructors, 87; navigators, 85; first-class radio, 20; second-class radio, 20; third-class radio, 52; ground engineers, 651; aircraft registration certificates, 332; aircraft airworthiness certificates, 261; aerodrome licences, 240 (in addition to which the Government provides 268 aerodromes, landing areas, flying boat bases and emergency alighting areas).

An order for another 11 PBY2s has been placed with the Consolidated Aircraft Corporation by the Government for the R.A.A.F. Extremely useful for coastal patrol work, these boats are intended to "replace" the Sunderlands which were about to be flown to Australia at the outbreak of war. The first order was for seven, and the end of this year has been spoken about as a possible date of delivery.

Australian-built Gipsy Engines

With the delivery by General Motors-Holden of the first twenty Gipsy Major engines for the DH Tiger Moth primary trainers, the first stage in the production of 500 of these units has been achieved in Australia. Only production men can realise the tremendous effort behind this achievement by the contractors and sub-contractors in several States, in the manufacture of over 500 different items for the engine in a very short time.



AUSTRALIA'S AERONAUTICAL LABORATORY: The newly completed building of the Aeronautical Division of the Council for Scientific and Industrial Research, at Melbourne.

This new development in Australian industry has called for the conversion from an automobile technique to that of aero engine precision, and some idea can be gleaned of the immensity of this task when it is learned that an agricultural implement manufacturer produced the camshaft. This camshaft is hollow and the manufacturing operation is similar to that required for the production of rifle barrels. With the aid of munitions engineers, this firm produced a praiseworthy job.

Every part of the engine is subjected to a critical examination before it is passed for assembly. The crankcase is X-rayed for material segregations, casting faults and internal cracks. All parts are put through an electric crack-detector for surface cracks, while one engine in fifty undergoes a fifty-hour type test on the bench. This engine is then completely dismantled and checked, reassembled, and given one hour's acceptance test before delivery.

An outstanding achievement in the production of this Gipsy engine in Australia was the connecting rods. These were a perfect job, and were the first of their kind ever commercially produced in Australia, being a machined aluminium-alloy forging. All this work has been developed and produced in about a year, without the full range of manufacturing equipment being initially available in Australia, and this is a commendable achievement.

Around Australia

A Brisbane business man, wishing to fly round Australia, left Sydney by flying boat on the first stage of his trip. He was accompanied by his wife, who acted as his secretary. His schedule was:

Sydney-Darwin by Qantas Empire flying boat (2,384 miles), Darwin-Daly Waters by Guinea Airways (328), Daly Waters-Wyndham by MacRobertson-Miller Airlines (524), Wyndham-Perth by MacRobertson-Miller Airlines (1,903), Perth-Melbourne (1,809) and Melbourne-Sydney (440), both by Australian National Airways.

In circumnavigating Australia by air a distance of 7,388 miles has to be covered. At Darwin, passengers now have much better accommodation as the new hotel, which has some affiliations with one of the airlines, is now open.

C.O.D. in the Outback

A little discussed, but highly important, service to the outback districts of Queensland and Northern Territory is the C.O.D. system which Qantas has successfully carried on since the early days of the company. By this method people living in country centres are able to order from the large city houses of Brisbane and Sydney, and Qantas not only delivers the parcels at destinations, but collects the cash through its many agencies, and finally settles with the despatching firm.

Lady purchasers can buy the very latest models in shoes and frocks and obtain delivery within a few days. Developing with the years, figures for the past 12 months show that over 1,000 items, to the value of about £3,000, were handled in that period.

CAPT

CONSAIR GETS $20,016,699 JOB

Signals 'Go' On Doubling Size of Plant

The navy department has awarded a new $20,016,699 contract for airplanes to the Consolidated Aircraft Corp., Consair authorities announced today. No official details were released as to the number or type of aircraft involved, but it was believed that the contract specified latest developments of the local plant's famed PBY patrol bomber series.

A complete resume of the year's activities at the Consolidated Aircraft Corp. plant may be found on Page 8-A.

The huge order brings the Consolidated backlog of military plane orders to approximately $37,000,000, placing it securely among aviation's "big four," plant spokesmen said. More than 3000 workers now are employed on an earlier navy contract totaling $5,000,000 and an army contract for $12,000,000.

Get Acreage for Expansion

Maj. R. H. Fleet, Consolidated head, was in Washington concluding details of the contract, but local spokesmen said they assumed plant expansion plans, already announced, would be carried out in the immediate future.

Consolidated recently leased 17 acres adjacent to the Lindbergh field plant and obtained an option, containing no termination clause, on an additional 30 acres. Under terms of the lease, which runs concurrently with that covering the acreage upon which the existing plant is located, Consair will pay a "nominal" rental. The leases have 45 years to run, Joe Brennan, port director, stated.

Building Cost $2,500,000

In order to handle the additional navy order, it was expected that Consair would widen the present factory building by some 250 feet

Consolidated Gets $20,000,000 Navy Plane Contract

About Dec. 20-'39

Closing Agreement Signed With Treasury Stipulates Method of Computing Costs

Wash D.C. paper(?)

Lifts Backlog to $37,000,000

WASHINGTON — Consolidated Aircraft Corp. of San Diego, Calif., was awarded a contract for airplanes totaling $20,016,699 by the Navy Department.

The new contract increases company's backlog of unfilled orders to approximately $37,000,000 consisting almost entirely of U. S. Army and Navy orders. Consolidated has not as yet participated in any of the large foreign business placed in this country during 1939, but reports indicate that Great Britain is considering the purchase of 50 long-range patrol bombers.

Treasury Signs Closing Agreement

Secretary Morgenthau announced that the Treasury has signed a closing agreement with Consolidated Aircraft which stipulates how certain items may be handled in computing the company's costs on a Navy Department contract which is subject to the profit limiting provisions of the Vinson-Trammell act as amended by the national defense act.

The closing agreement provides that for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed. It also permits the company to charge off similarly the depreciated cost, less salvage value, of certain buildings which are necessarily required to be demolished in order for the company to carry out the contract. Cost of making the demolition is likewise allowed as a chargeoff.

No Fixing of Depreciation Rates

With respect to any buildings, machinery, or other similar facilities which may be acquired in order to perform the contract, the closing agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction for whatever part is permanently discarded upon the contract's completion. The allowance for cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and the salvage value at that time.

The deductions allowed are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

The Consolidated agreement is the second executed by the Treasury under the profit limit law. First agreement was made with Colts Patent Fire Arms Manufacturing Co.

NAVY ORDERS PLANES TO COST $20,000,000

N.Y. Times 12-21-39

Consolidated Signs Agreement Covering Production Charges

+X

Special to THE NEW YORK TIMES.

WASHINGTON, Dec. 20—A $20,016,669.60 Navy Department airplane contract was awarded today to the Consolidated Aircraft Corporation of San Diego, the second subject to the 12 per cent profit-limiting provisions of the Vinson-Trammell Act as amended by the National Defense Act. At the same time the Treasury Department stated that it had signed an agreement stipulating how some items may be handled in computing costs.

The agreement provides that, for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed during the performance of the contract.

It also provides that the company may charge off as an indirect factory expense the depreciated cost, less salvage value, of buildings which must be demolished in order for the company to carry out the contract. The cost of making the demolition is also to be charged as an indirect factory expense.

With respect to any buildings, machinery, or other similar facilities which must be acquired by the company to perform the contract, the agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction with respect to the portion permanently discarded upon completion of the contract.

The allowance permitted with respect to the cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and for the salvage value at that time.

The deductions allowed with respect to these new facilities and the demolition of old facilities are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

Trib-Sun 12-27-39

HUNDRED EXCEEDED IN NAVY ORDER FOR CONSAIR PLANES

The navy department, in an official announcement, has revealed that the $20,016,669 contract for warplanes awarded last week to Consolidated Aircraft Corp. calls for construction of more than 100 PBY-5 patrol bombers.

The PBY-5 was described as being an advanced model of earlier PBY's, the big flying boats which have blazed ocean trails for the navy in a series of spectacular mass flights, most of which began here.

The new planes will have a cruising range of from 4000 to 5000 miles. Each will be powered with two 14-cylinder, 100-horsepower Pratt & Whitney engines, turning three-bladed propellers. They will have a wingspan of 104 feet, the hulls will be 65 feet long and 18½ feet high and each will weigh 12 tons. They will be flown by crews of seven officers and men.

Completion of the contract will bring into service more than 300 planes of the PBY class. They are designed to patrol the navy's far-flung sae lanes between mainland and Pacific island bases and to reinforce hemisphere defense policies, The Associated Press reported.

BIG NAVY AIR BOATS TO PATROL PACIFIC

Dec 24-39

Fifty Giant Craft Reported Involved in $20,016,669 Order to California Plant

N.Y. Times

By The Associated Press.

WASHINGTON, Dec. 23—The navy has ordered a fleet of giant, long-range, four-motor flying boats to patrol its far-flung "line of observation" in the Pacific and to reinforce the Administration's hemisphere defense policies.

Authoritative sources reported today that possibly fifty or more craft with a range of more than 5,000 miles were involved in the $20,016,669 order, the largest single aircraft contract in navy history, which went to the Consolidated Aircraft Corporation, San Diego, Calif., on Dec. 20. In accord with the navy's policy details were withheld.

The newest additions will augment fifteen other four-motor ships of the same general type ordered last year, and more than 200 smaller two-motor flying boats already in service.

The two-motor patrol craft have been "ferried" nonstop by the score to Hawaii and Panama and have been termed by foreign aviation experts "incomparably" the most formidable overseas striking force of the kind in existence.

Experimental Model a Monoplane

The navy has been experimenting with four-motor flying boats since 1935. The newest planes ordered are a development of the consolidated concern's experimental model, PB2Y2, a high wing monoplane with four 1,000-horsepower 14-cylinder motors. This plane weights about 30 tons, has a 118-foot wingspread and carries a crew of nine.

The unofficial estimate that fifty or more were involved in the $20,016,669 order was based on the cost of those contracted for last year. President Roosevelt asked Congress for $3,875,000 for nine four-motor navy planes, in addition to six provided for in the 1939 budget, so that their unit cost was $430,000 each. It is understood that the unit cost was reduced in the new, larger order.

Both army and navy are experimenting meanwhile with still more giant craft.

The army, seeking to extend the range and load capacity of its bombers, intends to build five planes nearly twice the size of its present seventeen-ton, four-motored bombers. About $4,000,00 was included in pending budget estimates for craft to weigh about thirty-five tons and capable of non-stop flights of well over 5,000 miles.

A single thirty-four-ton bomber, the B-15, has been making experimental flights for the last two years. It took medicines to Chile after an earthquake early this year.

Fifty-two of the four-motor seventeen-ton "fortress" bombers, such as have made round trip good-will flights to South America, were in service or on order when the $300,000,000 Air Corps expansion program was voted by Congress last year.

In recent months orders for a somewhat larger number were divided between two Pacific Coast plants.

Further, the War Department estimates turned over to President Roosevelt are understood to have included provision for 200 bombers of all types, of which a large proportion presumably would be of four motors.

The newest models turned over to the Air Corps are capable of top speeds of more than 300 miles an hour and they can carry five tons of bombs each, aviation circles understand.

To increase their range and power still further, the Air Corps is helping finance experiments with a forty-two-cylinder motor.

Western Flying.

When Consolidated Aircraft Corp. wanted two powerful new type aircraft engines in a hurry from the Pratt & Whitney Co. plant in East Hartford, the Army loaded them on its C-39 transport. Here's the crew after it landed in San Diego: Lieut. T. J. Schofield, Maj. E. R. McReynolds, Lieut. Glenn Holland, welcomed by E. N. Gott of Consolidated and W. G. Chamberlain of Pratt & Whitney.

So the cadets are flying over the United States, Consolidated PT-3A and Stearman PT-13 trainers are doing their eights, spins and rolls over California, Illinois, Nebraska, and Oklahoma. Western Flying

---

Consolidated Aircraft Corporation at San Diego has leased an additional 17 acres adjoining Lindbergh Field, and its present plant site. It is understood that additional manufacturing facilities are to be built on the new site.

Evening—8:00 P. M.

T. P. WRIGHT, Chairman

Engineering Experimental Aircraft—W. A. HITE, Vultee Aircraft Div., Aviation Mfg. Corp.

New Method of Developing Prototype Airplanes as Applied to Consolidated Aircraft Corp.'s Model 31—B. W. SHEAHAN, Consolidated Aircraft Corp. (Motion picture: Building PBY airplanes.)

Western Flying.

Another record aircraft development achievement was presented in the second paper of the evening—the story of Consolidated Aircraft Corp.'s sensational Model 31 flying boat. The discussion was presented by B. W. Sheahan, engineer in charge of drafting and personnel at Consolidated and related the phenomenal 10-month progress from authorization to test flight.

The talk of the industry, Consolidated's Model 31 stood revealed by Mr. Sheahan as the first plane to use the new Davis airfoil in its wing; the first plane to fly the Wright 18-cylinder, double-row, 2000 h.p. engines; and far superior to the Consolidated PBY series in performance. A brief table of dimensions in his talk revealed the ship's weigh empty as 25,000 pounds and "a proximately" 50,000 pounds gross.

Much of Mr. Sheahan's paper discussed the development of the Model 31 in less than a year's span as compared to the two to three year development of big flying boats under the standard prototype procedures of government practice.

Motion pictures were shown of the Model 31's first test flight.

ELVE APPROVED FOR REAR ADMIRALS

Selection of Captains and of 80 Commanders for Captaincies Announced

ACCEPTED BY PRESIDENT

Tower, Navy's No. 1 Flier, Is Among Dozen Promoted to the Higher Rank

Special to THE NEW YORK TIMES.

WASHINGTON, Dec. 13—President Roosevelt approved today a navy board's selection of twelve captains for promotion to rear admirals and eighty-one commanders for advancement to captains, most of them officers of the line.

The new admirals include the Chief of Staff of the Fleet, the Chief of Staff of the Battle Force and the Chief of the Bureau of Aeronautics. Admiral Charles P. Snyder, new commander of the Battle Force of the Fleet, was president of the board of selection.

Rear Admiral Towers, Chief of the Naval Bureau of Aeronautics, has been holding that grade temporarily and today's action of the President makes him a permanent flag officer. He is a noted naval aviator with a flying career of nearly thirty years. He was one of Glenn Curtiss's first pupils and he mommanded the first naval flying unit to see foreign service. This was at Vera Cruz in 1914. He has been an aviation attaché of the embassies in London, Paris, Berlin, Rome and the Hague and is a former Chief of Staff of the Aircraft Battle Force. He is 54 years of age.

Similar boards will meet in the next few weeks to choose several hundred officers for promotion to the grande of commander, lieutenant commander and lieutenant.

The prospective appointees are:

Captains to Become Admirals

John Henry Towers, chief of the Bureau of Aeronautics.
Ferdinand Louis Reichmuth, captain of Navy Yard at Washington.
Isaac Campbell Kidd, commanding officer of the Arizona.
Roland Munroe Brainard, director of Ships Movement's Division, office of the Chief of Naval Operations.
Sherwoode Ayers Taffinder, Chief of Staff and Aide to the Commander of the Battle Force, the flagship California.

Captains to Rear Admirals

Alexander Sharp, office of the Chief of Naval Operations.
Aubrey Wray Fitch, commandant of the Pensacola Naval Air Station.
Robert Alfred Theobald, Chief of Staff and Aide to the Staff Commander in Chief, United States Fleet.
Raymond Ames Spruance, commanding officer of the Mississippi.
Henry Kent Hewitt, Inspector of Ordnance in charge of the Naval Ammunition Depot at Puget Sound.
Felix Xerxes Gygax, Director of the Naval Reserve Division Bureau of Navigation.
Charles Alfred Dunn, manager of the industrial department of the New York Navy Yard.

Comanders to Be Captains

Robert Benthan Simons of Charleston, S. C.
Samuel Jacob Zeigler Jr. of Falmouth, Va.
Alfred Eugene Montgomery of Piedmont, Calif.
Robert Stevenson Haggarty of Salem, N. Y.
Ingram Cecil Sowell of Lawrenceburg, Tenn.
James Cary Jones Jr. of Huntsville, Ala.
Daniel Edward Barbey of Portland, Ore.
Elmer Lee Woodside of St. Joseph, Mo.
Glenn Benson Davis of Norwalk, Ohio.
Palmer Hall Dunbar Jr. of San Diego.
Thomas Macy Shock of Coronado, Calif.
Adolf Von Scheven Pickhard of New York City.
Norman Campbell Gillette of Chicago.
George Dickson Hull of San Diego.
Paul Hendren of Chadbourn, N. C.
Chapman Coleman Todd Jr. of Washington, D. C.
Wilbur John Ruble of Eaton, Calif.
John Lesslie Hall Jr. of Williamsburg, Va.
Laurence Toombs Du Boose of Washington, D. C.
Arthur Granville Robinson of Washington, D. C.
Walter Edward Doyle of Cheyenne, Wyo.
Charles Jefferson Parrish of Coronado, Calif.
Oliver Lee Downes of Dover, Del.
Paulus Prince Powell of White Plains, Va.
Samuel N. Moore of Washington, D. C.
Leo Hewlett Thebaud of Washington, D. C.
Henry Albert Seiller of Syracuse, N. Y.
Robert Dudley Kirkpatrick of Dothan, Ala.
Carleton Fanton Bryant of Searsport, Me.
John Henry Buchanan of Bonham, Texas.
Herman Adolph Spanagel of Allentown, Pa.
Laurence Wild of Wilber, Nebr.
Roy Pfaff of Washington, D. C.
Joseph Reasor Redman of Reno, Nev.
Frank Loper Lowe of Pine Bluff, Ark.
Theodore Davis Ruddock Jr. of Annapolis.
George Barry Wilson of Norfolk, Va.
William Keen Harrill of Knoxville, Tenn.
Greene Williams Dugger Jr. of Greensboro, Ala.
John Marie Creighton of Westport, Conn.
Edmund Weidmann Burrough of Oswego, N. Y.
Albert Harold Rooks of Seattle, Wash.
Charles Emery Rosendahl of Cleburne, Texas.
John Gould Moyer of Delphi, Ind.
Robert Ward Hayler of Newport, R. I.
Richard Lansing Conolly of Waukegan, Ill.
William Anderson Corn of Ogden, Utah.
John B. W. Wallen of Manchester-by-the-Sea, Mass.
Thomas D. J. Doyle Jr. of Lincoln, Nebr.
Alexander Rieman Early of Baltimore.
Kemp Catlett Christian of Bogalousa, La.
William Augustin Heard of Sabinal, Texas.
Thomas Shore McCloy of Monticello, Ark.
Lyell St. Louis Pamperin of Oconto, Wis.
Herbert Ross Hein of Coronado.
George Ramford Ashe of Raleigh, N. C.
Robert Paul Hinrichs of Boston.
Pat Buchanan of Bonham, Texas.
Carlos Augustus Bailey of Washington, D. C.
Wells Eldredge Goodhue of Seattle.
Wallace Benjamin Phillips of New York City.
Harry Dickson McHenry of Adams, N. Y.
Eugene Thompson Oates of Baltimore.
Robert Messinger Hinckley of St. Paul.
Eric Lloyd Barr of San Pedro, Calif.
Rivers Johnson Carstarphen of Houston.
Virgil Childers Griffin Jr. of Mobile.
Benjamin Perlman of Pasadena.
James Chaffin Clark of Columbus, Ga.
Robert Archibald Hall of Hampton, Neb.
Guy Chapman Hitchcock of Honolulu.
Anton Bennett Anderson of Bloomfield, N. J.
Schuyler Mills of Austin, Texas.
Forrest Unna Lake of Florence, S. C.
Clarence Gulbranson of River Forest, Ill.
Carroll Morgan Hall of Philadelphia.
Campbell Dallas Edgar of Cazenovia, N. Y.
Paul Seymour Theiss of Indiana, Pa.
Charles Snow Alden of Troy, N. Y.
Otto Marquard Forster of St. Louis.
Leonard Noel Linsley of Baltimore.

Navy Classifies PBY-5 Bombers

Union Dec 27-39

Clearing up misunderstanding as to the precise type of long-range bomber to be built under Consolidated Aircraft corporation's latest contract of $20,016,669, the navy department officially announced yesterday that the contract calls for delivery of more than 100 two-motored PBY-5 type patrol bombers.

Described as improvements of previous type PBY's, the new bombers will increase to more than 300 the number of such craft in service, The Associated Press reported from Washington.

The big flying boats will have a cruising range of 4000 to 5000 miles. They are designed to patrol the navy's long line of observation between island bases in the Pacific and to reinforce hemisphere defense policies.

Each air boat will be powered with two 14-cylinder 1000-horsepower Pratt and Whitney engines turning three-blade propellers. They will have a wing span of 104 feet. The hull will be 65 feet long and 18½ feet high. Each will weigh 12 tons and carry a crew of seven officers and men.

We released approx 200 pictures all over world

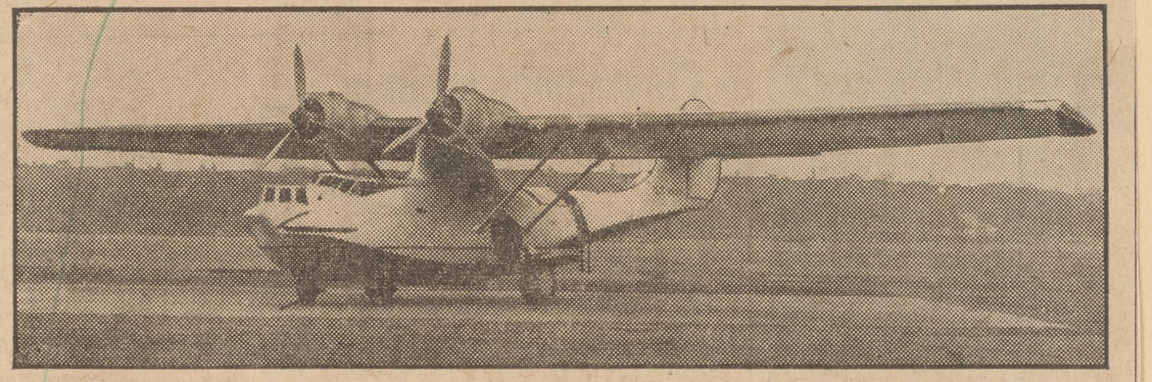
New 'Mystery' Plane Arrives Here for Trials by the Navy

No Technical Questions Get Answers and Cameras Are Kept at a Distance



UNCLE SAM'S NEWEST "MYSTERY" PLANE—The giant patrol bomber, built on the West Coast for the Navy, is shown as it arrived at the Naval Air Station to be flown for performance tests. All technical information is being withheld from the public. —Underwood & Underwood Photo.

The Navy's latest mystery-veiled patrol plane—a squatty, blunt-nosed amphibian—roared into the Naval Air Station at Anacostia yesterday afternoon for a series of performance trials.

The giant ship, built in secret on the West Coast, rolled to a stop on the main runway in view of newsreel cameramen and news photographers, allowed to "shoot" the new craft for the first time.

But even so, the ship still was kept well "under wraps." Cameramen and reporters were required to make their pictures and observations yards away from the plane. Technical information was withheld completely at the station.

Later, Comdr. L. P. Lovette, information officer at the Navy Department, said "absolutely no data" on the plane is to be made public, adding, "we had an extremely difficult time even getting you fellows pictures."

The ship resembled a huge spraddle-legged bug in its position between rows of small scouting planes being tuned up for routine flights.

Lands Without Circling.

The plane landed directly without circling and members of her crew climbed from the ship's interior, partially glass inclosed, to be greeted warmly by Comdr. S. P. Ginder, in charge of the station.

The crew members were Lt. Carl E. Giese, pilot; Lt. Roy Jackson, co-pilot; K. L. Frye, machinist mate, first class; S. C. Dills, machinist mate, second class; J. R. Wilson, chief radioman, and G. R. Tibbs, machinist of the Consolidated Aircraft Corp., builders of the craft.

The final lap of the ship's transcontinental flight—from Pensacola, Fla., to Washington—was completed in 6½ hours and under "excellent flying conditions," according to members of the crew.

A question, "What's her top speed?" brought from the amphibian's pilot the reply:

"I'm sorry. I can't say."

A similar reply was given all queries regarding technical details of the plane's performance. Otherwise, the crew and attaches at the station were smilingly co-operative.

104-Foot Wing Spread.

The crew members shivered for nearly 30 minutes in the cold breeze blowing across the landing field to allow photographers to make pictures of them with the ship in the background. Lt. Comdr. M. E. A. Gouin, who as flight test officer at the station will have charge of the plane's performance trials, answered general questions concerning the transcontinental flight and the pending tests, which he described as "purely routine."

The plane took off from San Diego Thursday and made overnight stops at Randolph Field in Texas and at Pensacola en route to the base here.

The patrol ship is a high-wing type with tricycle landing gear which folds into the body. Its pontoons retract into the ends of the wings which support the two twin Wasp engines. The wing spread is 104 feet and the ship measures 65 feet from its turned-up nose to tail.

Under the amphibian's wings is painted "XPBY-5A," which is no mystery.

In the layman's language that inscription simply means "long-range patrol ship." But that's about as far as the Navy cares to go.

Consolidated Aircraft C

Positions in shares are suitable only for those who can afford to carry a high degree of speculative risk; approx. price, 29. The U. S. Navy—Consolidated's best customer—recently awarded this company a $20 million order and boosted the unfilled order backlog to around $37 million. In the meantime, reports are current that Great Britain may purchase 50 long range patrol bombers from this concern. So far, Consolidated has not received any of the foreign business placed in this country over the past several months. Dividends are likely to be postponed in favor of plant expansion.

Mighty New Bomber Wheeled Out for Flight Test Tune-up

L. A. Times

SAN DIEGO, Dec. 26.—One of America's mightiest Army bombers was wheeled out of the Consolidated Aircraft Corp. factory for the first time today and a corps of technicians prepared it for test flights soon to take place.

The four engines of the sleek, silver-fuselaged craft, said to generate 5000 horsepower, were tuned up in a preliminary phase of testing as plant officials ordered every precaution before the untried plane takes to the air.

Performance far in excess of the Boeing "flying fortresses," most powerful in active army service, is expected of the Consolidated plane, officially designated B-24. The Boeing can fly more than 250 miles an hour over a nonstop range greater than 3000 miles and carries five machine guns.

Exact performance characteristics and armament of the B-24 are closely guarded Army secrets.

One of the Consolidated plane's striking features is its comparatively narrow wingspread for a four-engined ship—only 110 feet. It is known as the "perfect wing," developed by David R. Davis, veteran Los Angeles aeronautical designer and former associate of Donald Douglas. The Consolidated Model 31—largest airboat in the nation—also employs this wing, housing two 2000-horsepower motors.

Consolidated has two contracts, totaling $11,365,000, for an unnamed number of four-engined Army bombers.

Aerial War Monster Passes First San Diego Test Flight

L. A. Times

SAN DIEGO, Dec. 29. (Exclusive)—With Brig. Gen. Jacob Fickel, commander of the G.H.Q. First Wing at March Field, and three members of his staff looking on, the Consolidated B-24, America's most advanced Army bomber, was unveiled to public view here today.

The giant, four-motored craft, a radical advance on the Boeing "flying fortresses," was wheeled out of the plant for the first time Tuesday, but not until today was the plane ready for testing on Lindbergh Field, the municipal airport.

Feeling each of the manifold controls cautiously, the flight crew taxied the ship around the field for a few minutes, and then fully satisfied with every feature of the untried bomber, took the plane up for the first time.

Brig. Gen. Fickel was accompanied here in a Douglas B-18 bomber by Maj. Earl Hoag, executive officer; Maj. Howard Ramey, operations officer, and Lieut. Boyd Hubbard, his aide.

A large crowd of civilians around the rim of the field and on adjacent housetops witnessed the long-heralded debut of the B-24, first of an undisclosed number of similar planes destined to give the United States mastery of the skies.

New U.S. speedsters: the Navy's Consolidated XPBY-5A . . . the Army's 420-mile-an-hour Vultee Vanguard

AVIATION

Army Vultee Does 420 M.P.H. and Climbs at Mile a Minute

Aeronautical engineers frequently predict air speeds in excess of 500 miles an hour, but the official world's record of 440 miles an hour, made in 1934 by the Italian Francesco Agello, still stands. And the fastest warplanes known to be in service on the European fronts are the German Messerschmitts and British Supermarine Spitfires, neither of which is much faster than 355 miles an hour.

Into this speed picture last week was projected America's newest fighting plane, a long-snouted Vultee ship called the Vanguard, reported to have tested at almost 420 miles an hour. In addition to turning up enough speed to catch practically anything in the air, the new interceptor-pursuit ship—resembling a bullet—can climb to 40,000 feet at better than a mile a minute and can be maneuvered with the ease of much slower ships, the experts said. Much of this speed results from the use of the new Pratt & Whitney 1,600-horsepower "substratosphere" engine (NEWSWEEK, Sept. 11). When the new Vanguard is delivered to the Army it will mount either a small cannon or an electrically operated machine gun.

Not to be outdone by Army speed, the Navy also boasted a superlative airplane—the largest amphibian ever built. This was the Consolidated XPBY-5A, "12 tons of plane with both landing and flotation gear," which was flown from the factory at San Diego, Calif., to Anacostia, D.C., last week. It is much like the Navy's PBY flying boats which frequently make mass flights to Hawaii.

These two top products enhanced America's already dominant position in the aeronautical world—leadership which has given our aviation industry a backlog of plane orders amounting to $550,000,000. Latest evidences of this boom last week:

¶ Lockheed Aircraft Corp. received a

Mystery Bomber Tested Over City

Union 12-30-39

All information as to its details a carefully guarded military secret, a new army bomber, first of several being built by Consolidated Aircraft Corp., was in flight over San Diego yesterday.

The big multi-motored plane took off at 2:30 p. m., and was in the air for some time. At the Consolidated plant, it was reported that it is not known whether the plane will be in the air again today. The war department has directed that no details as to speed, design, armament or cruising radius be revealed.

Consolidated—known for its amphibian planes — constructed the land bomber to incorporate new features of construction. The test flight was described as successful.

S. D. Plane Firms Boast Backlogs Of 43 Millions

Union Jan 3-40

San Diego's aviation industry starts the New Year with a backlog of more than $43,000,000 in orders, greatest in the history of local plants and during the year employment in this line is expected to reach a new high.

Elsewhere in California plane factories are working on a backlog totaling $180,000,000, much of it war orders from abroad.

However, some of the orders in southern California plants are for commercial craft, it was indicated when Douglas Aircraft at Santa Monica announced it had started work on 40 DC-4 air transports valued at $14,000,000. These are four-engined sky craft, with a top speed of 262 miles an hour, cruising radius of 2000 miles, day capacity of 42 passengers and sleeper capacity of 22. They are equipped with super-charged cabins for high-altitude flying.

San Diego's plane orders, held by Consolidated, Ryan and Solar aircraft companies, are principally for military and naval planes, mostly being built for the U. S. government. Consolidated recently received a $20,016,699 order for flying boats from the navy departbent, bringing its backlog above $40,000,000.

NAVY ASKS 200 S.D.-TYPE BOMBERS

Trib Jan 8-40

Air Chief in Texas After S. D. Inspection

Brig. Gen. George H. Brett, chief of the army air corps materiel division, spent last night at El Paso, Tex., after taking off from Lindbergh field yesterday morning. Saturday Brett inspected the Ryan Aeronautical Co. and Consolidated Aircraft Corp. plants, viewing planes under construction at the two plants for the army.

Brett reported that the new four-motored bomber just completed at Consolidated probably will be flown from here to Wright field, Dayton, O., next month for tests. He reported that American aircraft factories have been awarded contracts totaling $120,000,000 for combat, bombing and training planes for the present fiscal year.

Union Jan 11, 40

Plane Factories Employ 28 CCC Graduates

Twenty-eight youths who recently completed a course of instruction in aviation at the Vista civilian conservation corps camp have been employed at the Ryan and Consolidated factories. Eight of the former CCC workers were employed by Ryan and the remainder by Consolidated.

The aviation instructor at the camp is C. Irwin, who is now instructing 16 more students.

Aircraft Work Training Urged

Vocational School Expansion Sought

A proposal to expand the local vocational school to provide training for 3000 men who can be absorbed before July 1 by the local aircraft industry, unanimously was recommended to the San Diego board of education yesterday by chamber of commerce directors.

H. A. Tiemann, vocational school director, told chamber officials that "this emergency involving the training of 3000 local men during the next six months can be met at a cost to the school district of $7060.

200 A WEEK

Donald Frye, personnel director, Consolidated Aircraft Corp., reported that his firm now is employing men at the rate of 200 a week and that the present personnel of 3000 men will be increased by June 1 to 7000 or 7500. Ryan Aeronautical Co., with 600 employes, will add 500 by next June, and the Solar Aircraft Co., with 450 employes, must add 100 by next summer, officials said.

The chamber's education committee, before which Tiemann outlined the plan of meeting the emergency, asked the chamber directors for the recommendation to the board of education.

MAJOR FACTORS

In approving the proposal the board held that three major factors justify the expansion: 1—Hundreds of young San Diegans will be afforded an opportunity to acquire positions in local industry during the next year. 2—Training of local men will prevent the importation of families from other states to establish themselves here. 3—Local aircraft factories prefer to employ San Diego citizens because they believe these men will be more permanent than those who might be attracted here.

Tiemann's recommendation to meet the emergency of training 3000 men for the aircraft industries embodies the addition to the school's

(Continued on Page 2-A, Col. 1)

Aircraft Work Training Urged

(Continued from Page 1)

teaching staff of one supervisor, three instructors, and the allocation of $4000 for equipment.

TOTAL COST

"Fifty percent of the salary expense," Tiemann said, "will be refunded by the federal government on July 1, thereby making the total cost of this expansion to the board of education $7060."

Frye, John Marco of the Ryan firm, and Edmund Price, Solar Aircraft Co. president, attended the directors' session and voiced sympathy with the plan to expand the vocational school.

Will Crawford, superintendent of schools, in a statement yesterday afternoon, declared that "the school administration has done its utmost to meet the vocational training needs in this area."

IMPORTANCE REALIZED

"Your school officials long have realized the importance of voca- tional training and the school [illegible] been devoting its attention to [illegible] paring young people for ente[illegible] the crafts in which job opportunities have been available," Crawford said. "One of the essential needs to a continuation of this successful training work in the vocational school is cooperation from citizens of this community.

"With this cooperation, your schools can continue to meet the vocational training needs."

Consair Silent On Augmented Plane Order

Indicating Consolidated Aircraft Corp. may receive another large order of navy planes, Adm. Harold R. Stark, chief of naval operations, said today the navy planned to obtain 200 more twin-engine long-range bombers of the Consolidated-built type, which flew in a formation of 48 from San Diego to Panama last year, The Associated Press reported today from Washington, D. C.

"Splendid Weapons"

Already 450 of these planes have been procured, or ordered, it was reported.

Stark's statement was made the house naval committee durin discussion of battleships, in whic he said present studies "indicate" that the navy will build 50,000 or 52,000-ton battleships. Larger vessels, he said, are not indicated.

On Dec. 20 Consolidated was awarded a $20,016,699 contract by the navy for an undisclosed number

Continued on Page 4A, Col. 6)

Indicates Gain In S. D.-Type Bombers

CONTINUED FROM PAGE ONE

of planes. Earlier last year, on March 22, the navy department awarded a $4,699,000 contract to the firm. The war department also awarded two contracts to Consolidated during 1939, one for $2,880,000 and the other for $8,485,000.

Stark, in revealing that within 22 months the navy will have 450 long-range bombers towards the goal of 650, was quoted by The United Press as stating that these flying boats will "constitute a perfectly splendid defensive or offensive weapon." The navy now has 250 of these bombers.

Consolidated officials, advised of the press dispatches quoting Stark, said they could make no statement.

Stark's information on the size of battleships contemplated came in response to questions as to what he thought of talk in congressional circles about building super-battleships of 70,000 or 80,000 tons.

Already at Work

Stark also told the house naval committee that the navy planned to obtain 200 more two-engine long-range bombers of the type which flew in a formation of 48 from San Diego to the Panama canal last year. Already 450 of these planes have been procured or ordered.

Stark also revealed that the two battleships for which President Roosevelt last week asked initial funds would be "practically" sister ships of the two 45,000-ton battleships for which congress voted starting funds last year. A house appropriations subcommittee is already at work on the president's latest request.

"Four such ships would be a perfectly splendid, high-speed unit," said Stark. He testified the four vessels were designed to have a speed of 33 knots.

"We are satisfied there is nothing on the ways in any way superior to what we have building or in contemplation," he asserted. Stark's explanation of present construction plans made it plain the navy does not contemplate starting any 50,000 or 52,000-ton ships this year.

Remarking that there had been "much talk" of the advantages of "62,000-ton battleships," Stark said that in his opinion they would be "either too big or not big enough." He did not explain his remark.

"By No Means Asleep"

Most naval officers who have been studying the question closely, he said, "leaned very much toward continuing our own program" and were not in favor of "rushing into something that looks very attractive on paper."

"The navy has not by any means been asleep on this question." The fleet's highest-ranking officer declared.

Comparing the advantages and disadvantages of super-battleships, Stark remarked that while a bigger craft obviously would be superior to an individual smaller ship, it should also be remembered that there is some advantage in numbers.

"A ship can be in only one place at a time," he said, adding that there had been an example of this fact in the south Atlantic recently. He apparently referred to the defeat of the German "pocket battleship" Admiral Graf Spee, by three smaller British cruisers.

Bigger ships, said Stark, would present a great target area for torpedoes, mines, bombs and guns. They would be able to get through the proposed new locks of the Panama canal, but Stark said that if the new locks happened to be jammed, the big ships could not negotiate the waterway at all.

He reported, too, that the navy is experimenting with 18-inch guns for battleships.

Its largest now are 16 inches.

NS SAN DIEGO, CALIFORNIA, TUESDAY, JANUARY 9, 1940 SECTION A 5 CENTS—75c PER MONTH

200 MORE S.D.-TYPE BOMBERS FOR NAVY; 50,000-TON SHIPS

Consair Silent On Augmented Plane Order

Indicating Consolidated Aircraft Corp. may receive another large order of navy planes, Adm. Harold R. Stark, chief of naval operations, said today the navy planned to obtain 200 more twin-engine long-range bombers of the Consolidated-built type, which flew in a formation of 48 from San Diego to Panama last year, The Associated Press reported today from Washington, D. C.

"Splendid Weapons"

Already 450 of these planes have been procured, or ordered, it was reported.

Stark's statement was made to the house naval committee during a discussion of battleships, in which he said present studies "indicate" that the navy will build 50,000 or 52,000-ton battleships. Larger vessels, he said, are not indicated.

WASHINGTON, Jan. 9 (A.P.)—Adm. Harold R. Stark today told congress that the navy is seeking $4,000,000 to carry out much of the proposed improvement program at the tiny Pacific island of Guam which the legislators rejected last year.

Stark's statement caused an outburst of questioning by members of the house naval affairs committee, who fought the Guam project at the session a year ago.

Stark, chief of naval operations, said the request for the funds had been included in the budget for the 14th naval district—the Hawaiian area — and explained that procedure was adopted because the navy did not need any congressional authorization for work in that district.

On Dec. 20 Consolidated was awarded a $20,016,699 contract by the navy for an undisclosed number of planes. Earlier last year, on March 22, the navy department awarded a $4,699,000 contract to the firm. The war department also awarded two contracts to Consolidated during 1939, one for $2,880,000 and the other for $8,485,000.

TH

14-YEAR EDUCATIONA' PROGRAM FOR S. D., PLAN TO BE OFFERED NEXT FALL AS AID TO STUDENTS

Inauguration of a new 14-year educational program, supplanting the present 12-year schedule, will be effected at San Diego High school next fall, the board of education announced. The additional two years, a junior college course leading to an associate of arts degree, will be designed to increase the vocational preparation of students "who stay in school because they cannot obtain employment because the demand for trained help in industry does not permit them to learn on the job as their parents did, and because university training is financially impossible to many who are qualified," explained John Aseltine, San Diego High principal, who will act as coordinator for the junior college program.

"Nothing will be changed in the present elementary, junior high or high school divisions of work," Will C. Crawford, superintendent of city schools, said. "We will coordinate the junior college program at San Diego High school with junior college work at State college, the Vocational school and San Diego Evening Junior college. There will be no duplication or competition between the different centers where the junior college program is carried on.

"Our high schools offer general cultural enrichment with some specific training," Aseltine said. "We now must do something for the vocational efficiency of our post-high school youth along the line of his or her bent, at a time when the student is ready for it. If two-thirds of our graduates go to college or into jobs immediately, it is for the other third that we offer needed help in our junior college program."

The board of education notified the chamber of commerce that vocational classes, requested for the training of aircraft workers, have been set up, and their number will be increased "as fast as the industry can supply us with competent teachers."

With two members (Dr. Edward L. Hardy and Jacob Weinberger) in the hospital, the other three members assured Don B. Smith, representing the chamber of commerce, and Donald Frye, personnel director at Consolidated Aircraft Corp., that the board was in full sympathy with training San Diego men for the jobs available at the three plane factories here.

Frye said his plant is hiring 200 men each week until July 1, but has to bring them here from other cities when qualified local men are not available.

Aircraft Class Begins

"We already have in operation the aircraft training school which you ask us to set up," Crawford told him, "but we are handicapped by lack of aircraft teachers. We must get these from your industry, with your cooperation, and at a salary that taxpayers can afford. With such teachers, we can push the program already going in our vocational school. Without them, we can do only the best we can."

The board members present, Mrs. Mildred Hale, O. E. Darnall and Mrs. Mary Fay, also:

Instructed board officers to issue diplomas for the 471 students who will be graduated from local high schools Feb. 2. They include 231 boys and 240 girls.

Approved retirement of 37 teachers who have reached retirement age under the new school pension plan at the close of this semester, after Crawford explained that all were either on leave of absence or on part-time, and that no new teachers would be employed to replace them.

Substitutes Named

Appointed as substitute teachers, or to other posts, E. G. King, J. E. Merk, Jack Warshauer, Wesley P. Heath, Anton J. Richetta, Edward D'Amico, Schurer Moe, Mary L. Jannoch, Frances Tupper, Alice Cole, Marie Johnson, R. A. Vernacchia, Mary E. Walker, Alvin Allen, Mrs. Marian V. Ramsay, Riva Bresler, Muriel Bartlett, Rosalie Maiss, Lowell Davies, Edward Janowsky, Richard C. Hager, Harold R. Hartley, Georgia Stebbins, Wilma Murray, Ethel M. Slayton, James Alexander, Levancha Bauman, Harold Charles, Alice B. Hammer, Hazel Holland, Connie Murphy, R. K. Perkiss, Marjorie Smith, L. R. Stillman, June Beebe, Mildred Epler, J. J. Kalstrom, Julia Knowlton and Marie Clavell.

Appointed W. L. Peterson director of the 1940 summer session.

Awarded to George Kruger on his bid of $2740, contract for constructing an additional room at Euclid school.

Bible Parley Asked

Instructed the clerk to write a letter to the Rev. Orno Tyler, San Diego Ministerial association head, inviting him to call a committee of Jews, Protestants and Catholics together to find a basis of agreement for placing the Bible as a reference in the public schools. It was brought out in discussion that all creeds decry the lack of religious instruction in the schools, but themselves prevent this step by disagreement as to what should be done.

Notified Col. John Sherman that high school students who are members of the national guard will receive leave and an opportunity to make up their work later, although the board requested that national guard officers cooperate by checking on ages of recruits to make sure they are 18 before being accepted.

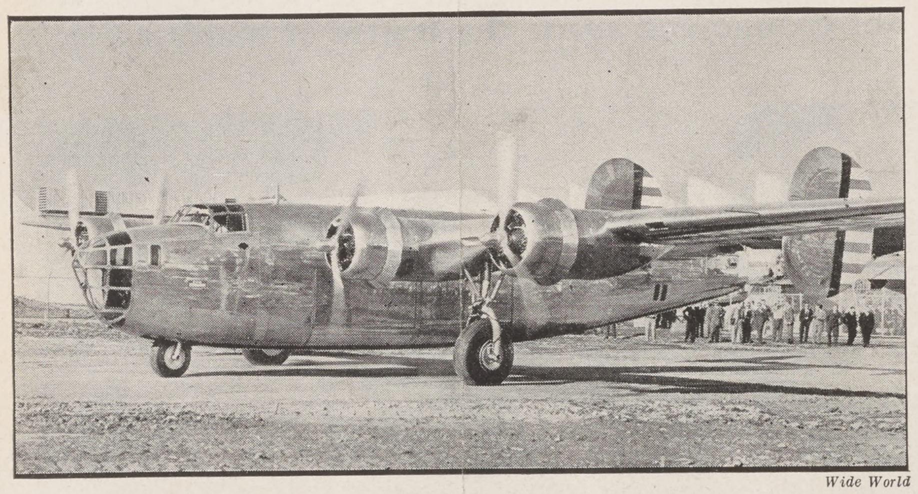
BUSINESS WEEK Jan 13-40

Consolidated Aircraft Tests a Fast New Army Bomber



Wide World

This Consolidated Aircraft army bomber attained a speed of 325 miles an hour—near top speed for planes of its type—in its initial test flights at San Diego, Calif., recently. Consolidated, builder of navy amphibian and patrol planes, has incorporated several new features in the four-engined, 5,000-h.p. land bomber—including a tricycle landing gear for greater safety, "perfect curve" wings for greater speed.

ARMY AIR CHIEF HOPS IN CONSAIR 4-MOTORED BOMBER ON S. D. VISIT

Union 1-17-40

Flying from Langley field, Va., to the west coast, Maj. Gen. Delos C. Emmons, commanding the army's general headquarters air force, arrived at Lindbergh field yesterday for a brief visit, a feature of which was a flight in the new 4-motored bomber recently completed at the Consolidated Aircraft Corp. plant.

Arriving at 1 p.m., he went with his party to the Consolidated plant. After a tour of the shops they entered the big B-24 plane and had a short flight over the city.

"Nice looking ship," was the general's laconic comment after they landed—and no further statements were forthcoming. The party immediately boarded the big twin-motored Douglas C-42 transport plane and took off for March field, Riverside, their next stop.

Gen. Emmons, a 1909 graduate from West Point, served in the infantry until 1917, when he entered the army's old flight training school at Rockwell field, North island. A year ago, with the rank of brigadier general, he commanded the first wing, GHQ air force, at March field, being promoted to major general last March and sent to Washington, D. C.

Accompanying Gen. Emmons were Capt. Wentworth Goss, his aid; Lt. Col. C. W. Lewis; Maj. Harold A. McGinnis and two mechanics.

Welcoming the party on its arrival here were Capt. W. W. Gross, commanding the local air corps reserve squadron, and Capt. John C. Horton, in command of the air corps training detachment here.

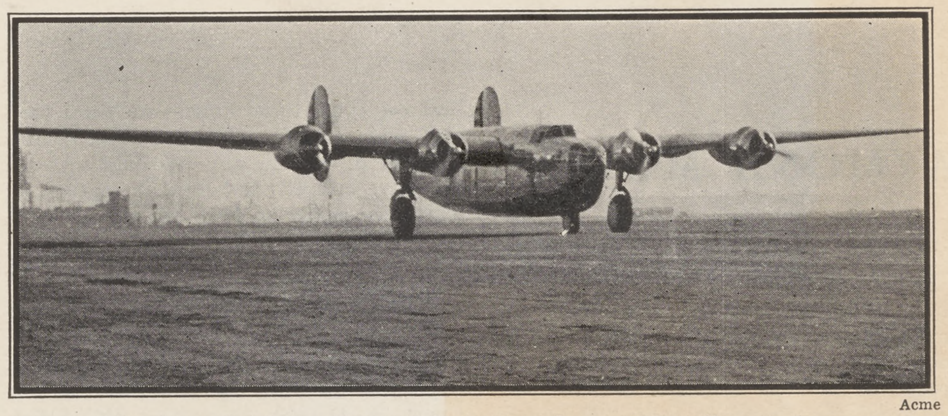
RECAPITULATION of NEWS of YEAR – DEC. 30 TRIB.

JANUARY 15, 1940 "NEWSWEEK" 59



Acme

The Army's Consolidated B-24 bomber—325 miles an hour

the glass and will silver a 12-foot-square area in 57 seconds, compared with the half hour for conventional processes.

Trends

Steel output for the first full week in 1940 was estimated at 86.1 per cent of capacity, compared with 85.7 in the New Year's week and 51.7 a year ago.

Coffee imports into the United States during 1939 were estimated at 16,104,000 pounds over the 1,900,000,000-pound record set in 1938.

The number of *cremations* during the five years ended Dec. 31, 1938, was recently set at 182,054 by the Cremation Association of America—a 24.7 per cent increase over those reported in the previous five years.

Freight carloadings for the week ended Dec. 30 decreased less than seasonally for the fourth consecutive time; at 550,270 loadings were the highest for that week since 1936.

In squadrons of five, each led by an experienced cross-country pilot, the private flyers hopped from point to point on the trip south, their gasoline and oil being furnished free by the Gulf Oil Corp. At the three-day maneuvers, they watched a program of air acrobatics, military flying, and light-plane racing, attended meetings and social gatherings of fellow air hobbyists, and just sat in the sun. The biggest racing event was the 1,000-mile cross-country flight ending in Miami, for $8,250 in prizes offered by Bernarr Macfadden. The winners of this race were: Homer Rankin, who flew a twin-motored Beechcraft from St. Louis, averaging 234.097 miles an hour; Russell Holderman, pilot of a Lockheed 12 which averaged 208.561 miles an hour from New York, and William M. Cason, who averaged 194.507 miles an hour from Houston, Texas.

¶ American Export Airlines signed a contract for three Vought Sikorsky flying boats for delivery starting next December, if the company gets permission of the Civil Aeronautics Authority to start its proposed Atlantic service. These ships will weigh 58,000 pounds and carry sixteen passengers nonstop across the Atlantic at cruising speeds of about 175 miles an hour.

¶ Pan American Airways, which is opposing American Export Airlines' application for an Atlantic route (NEWSWEEK, Nov. 13, 1939), disclosed it is in the market for a fleet of ocean planes that will dwarf its present 82,500-pound Clippers, the largest commercial air liners now in service. Contracts for planes weighing 125,000 pounds, capable of carrying 50 passengers (present Clipper capacity is 74 on day trips, 40 overnight) to Europe overnight at 300 miles an hour, will be let next summer on the basis of designs to be submitted by aircraft manufacturers.

¶ The Army's newest type bomber, the Consolidated B-24, underwent flight tests last week at San Diego, Calif. This big four-motored ship—5,000 horsepower—is capable of flying about 325 miles an hour with a full bomb load and has a nonstop range of better than 3,000 miles.

San Diego to Train Aircraft Workers

SAN DIEGO, Jan. 15.—Will Crawford, superintendent of schools, today informed the Board of Education that expansion of facilities of the local vocational schools has been started in response to demands of San Diego aircraft factories for hundreds of aircraft workers.

In six-week courses it is planned to provide by July 1 approximately 2000 young men with sufficient knowledge of aircraft fundamentals to qualify them for positions in the Consolidated, Solar and Ryan plants.

By the end of 1940 these factories expect to increase their pay rolls by 4000 men, to fulfill mounting orders for military aircraft.

Crawford explained that the greatest difficulty encountered in the vocational schools enlargement is the obtaining of competent instructors. He said that teaching salaries cannot equal that offered able technicians by private industry.

Trib. 1-17-40

Emmons Sees City From New Bomber

Maj. Gen. Delos C. Emmons, army general headquarters air force commander, on a brief visit here, yesterday was taken for a short flight over the city in the new four-motored bomber recently completed by Consolidated Aircraft Corp.

Emmons made no comment on the big plane, other than to say: "It's a nice looking ship." After landing at Lindbergh field, members of the officer's party boarded the Douglas C-42 transport plane in which they arrived here and took off for March Field, Riverside.

Emmons, with Capt. Wentworth Goss, aid; Lt. Col. C. W. Lewis, Maj. Harold A. McGinnis and two mechanics, was welcomed at Lindbergh field by Capt. W. W. Gross, local air corps reserve squadron commander, and Capt. John C. Horton, commander of the air corps training detachment here.

New Warplane Orders Pending

British Negotiations Reported Under Way at Southland Plants

By a Times Staff Correspondent

WASHINGTON, Jan. 15.—Southern California aircraft manufacturers appeared certain today to receive substantial orders for additional fighting planes for the British air force.

Negotiations with a view to placing contracts, primarily for bombers, are said to be proceeding satisfactorily, and there are indications that definite agreements will be reached within the next few weeks.

Large orders are in prospect for Douglas Aircraft Co. of Santa Monica and Lockheed Aircraft Corp. of Burbank, while a smaller order is likely to go to Consolidated Aircraft Corp. of San Diego. There is some chance also that the British will order more ships from North American Aviation, Inc., of Inglewood.

EDISON APPOINTED NAVAL SECRETARY BY THE PRESIDENT

N.Y. Times

Son of Inventor Promoted to Succeed Swanson After Filling the Post for Months

FOR AN 'INVINCIBLE' FLEET

Meanwhile, Officials Discount Talk of 60,000-Ton Warships as an Idle 'Dream'

Special to The New York Times.

WASHINGTON, Dec. 30—President Roosevelt today named Charles Edison, son of Thomas A. Edison, as Secretary of the Navy to fill the post vacant since the death last July 7 of Secretary Claude A. Swanson.

Mr. Edison, who was appointed Assistant Secretary of the Navy on November 17, 1936, had been Acting Secretary since Mr. Swanson's death. His appointment came as no surprise, although it had been expected that the President would await the convening of Congress to announce the selection. The brief White House announcement was as follows:

"The President has appointed Charles Edison as Secretary of the Navy. He gave him a recess appointment today."

Mr. Edison said that he would take the oath of office probably on Tuesday and smilingly told those who called to congratulate him that he did not want to call any one back to work on a government holiday and therefore would wait until the Navy Department opened after New Year's Day.

Plans a Simple Ceremony

Rear Admiral W. B. Woodson, Judge Advocate-General of the Navy, will administer the oath in a ceremony which Mr. Edison said would be a simple one attended by a few friends and officials of the navy and by newspaper men.

Mr. Edison's name probably will be submitted to the Senate for confirmation early in the session, it was said.

As Assistant Secretary Mr. Edison was a member of the "Little Cabinet" as well as one of President Roosevelt's circle of friendly advisers. His office has been a link between the Navy Department and the nation's industries which supply the needs of the naval establishment.

The great navy defense program, involving the expenditure of hundreds of millions of dollars, was entrusted to Mr. Edison, who has been primarily the administrator and the business executive of the navy ever since he took office, due to the almost continuous illness of Mr. Swanson for many months before his death.

Mr. Edison's interest in the navy goes back to the Spanish-American War, when, as a boy of 8 years of age, he was stirred more by the exploits of Admirals Dewey and Sampson than by the amazing inventions of his father. But Mr. Edison was not trained for the sea, being sent instead to Cartaret Academy and later to the Massachusetts Institute of Technology, from which he was graduated as an engineer.

Became Father's Aide in 1913

Mr. Edison joined his father in business in 1913 and soon became the administrator and executive of thirty-three organizations manufacturing, selling and distributing articles invented by the elder Edison.

The younger Edison became a friend of the President soon after the latter's inauguration in 1933 and participated in emergency and business relief programs. He helped to guide the NRA in New Jersey, later was assistant to Donald Richberg, NRA Administrator, and served as regional director of the Federal Housing Administration and as chairman of the New Jersey National Emergency Council.

Mr. Edison, now in his forty-eighth year, believes in an "invincible navy" that can defeat any probable enemy or probable combination of enemies. Such a navy was started under the defense program soon after Mr. Edison took office.

Last month, in making the annual Navy Day address, he said that the navy was now prepared to exercise the vital function of bringing the enemy to "our terms as quickly as possible while keeping him at a safe distance from our shores."

Praised Morale of the Navy

In that address, which was in the nature of a report on the condition of the navy, Mr. Edison declared that the morale of the men was high and the leadership of the officers proven by their accomplishments. He declared then for a continuing navy building program, and for a 100 per cent manning of the ships.

Meanwhile, it was learned today that the navy was not considering any plan involving the construction of battleships of greater than 45,000

Charles Edison Named Naval Secretary; Fills Post Vacant Since Swanson's Death

Continued From Page One

tons. Suggestions that the navy might build giant battleships of from 60,000 to 80,000 tons were not of naval origin and had little, if any, support in the designing, constructing or operating arms of the service, it was stated.

Charles Edison
Times Wide World, 1938

Representative Vinson of Georgia, chairman of the House Committee on Naval Affairs, who on Wednesday will introduce in the House the Administration-approved $1,300,000,000 Naval Expansion Bill, described the agitation for battleships of greater tonnages than ever before conceived as "a pipe dream."

Nothing had happened since the outbreak of the war in Europe, he said, to cause a change in the existing building program. This includes the big expansion bill to be introduced next week and on which public hearings will begin Monday, Jan. 8.

Cites Capacity of Shipyards

Mr. Vinson pointed out that the eight battleships now contracted for, of which six were now under construction, represented about the maximum load which the naval and private yards could take care of, while at the same time carrying forward the construction of other combatant types—aircraft carriers, cruisers, destroyers and submarines, which in their own particular spheres were as vital to the national defense as battleships.

In Mr. Vinson's opinion any two battleships of 35,000 or 40,000 tons would pay bigger dividends than a single giant craft such as had been suggested. The cost of such a ship would certainly be in excess of $100,000,000 and might even go as high as $150,000,000, he said, and to this would have to be added other millions for the building of new drydocks or for increases in the size of old ones, and a further large sum in the event that it was necessary to enlarge the Panama Canal to accommodate such large vessels.

"You can say," Mr. Vinson asserted, "that the navy has made no such suggestion and I am sure I am stating the fact when I say no such proposition is being considered. Furthermore, it would seem that few of our citizens understand the facts of the battleship situation in this country. The fact that the expansion bill which goes to Congress next week provides for no additional battleships seems to have caused a wide misunderstanding of the whole situation."

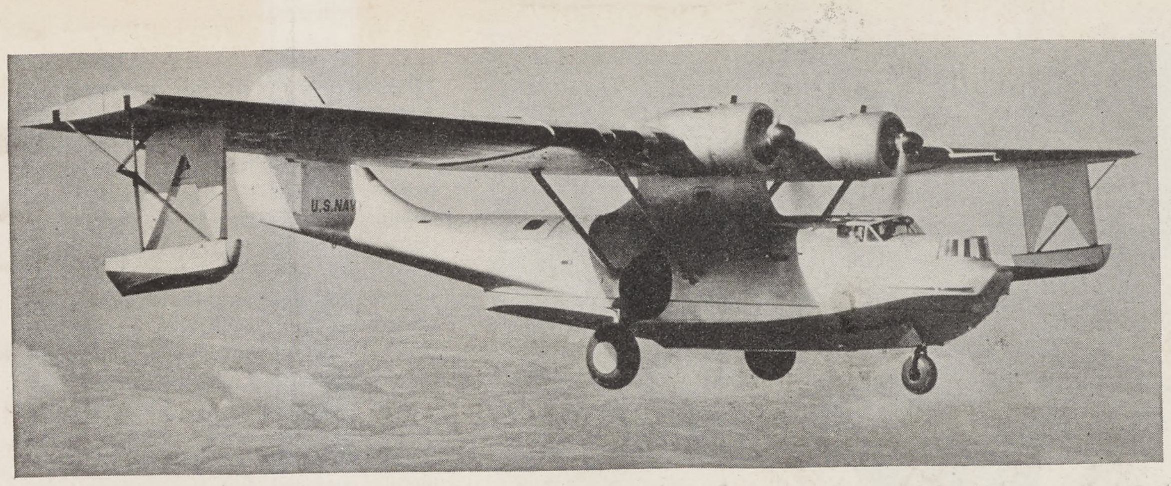
Fleet to Have 18 Battleships

To include battleships in the new expansion bill would be little more than a "silly gesture," in Mr. Vinson's opinion. Under the law as it now stood, he stated, the navy was authorized to construct ten additional battleships in the next five years, which would create a fleet of eighteen new battleships in commission or under construction before Jan. 1, 1946. That, said Mr. Vinson, was why the new expansion bill did not include battleships.

Summed up, the expansion provided for in the new $1,300,000,000 bill would mean the immediate increase of the combatant strength of the navy from 272 to 372 ships. The fleet, with these additions, would comprise eighteen battleships, eleven aircraft carriers, fifty-three cruisers, 202 destroyers, eighty-eight submarines, and an air strength of 6,000 planes. In addition, the bill calls for additional auxiliaries to a total of 125,000 tons.

The first witness to be called by the Naval Affairs Committee will be Admiral Harold R. Stark, chief of naval operations. Admiral Stark will urge passage of the bill in the form in which it will be introduced by Mr. Vinson. Mr. Edison, Rear Admiral John H. Towers, chief of the naval Bureau of Aeronautics, and Rear Admiral C. W. Nimitz, chief of the Bureau of Navigation, also will indorse the measure, it was said today.

Mr. Vinson hopes to conclude hearings in about two weeks and to bring the bill to the House early in February.



Flying Equipment

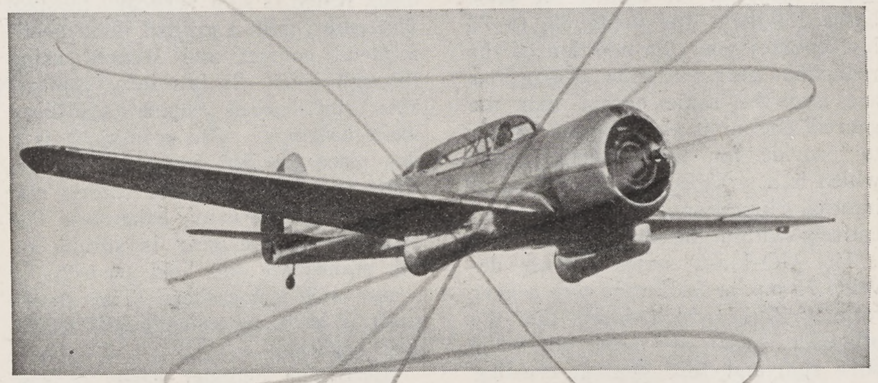
CONSOLIDATED Amphibian

THE latest achievement of the Consolidated Aircraft Corporation is the building of the world's largest amphibian, the Model 28-5A, or as designated by the Navy, the XPBY-5A. The new amphibian is basically the familiar Model 28 twin engine flying boat, better known by its Navy designation, PBY. The change was accomplished chiefly by the addition of a tricycle landing gear which is fully retractable. The side wheels and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the retracted position is completely closed over by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, which handles all the necessary operations in sequence automatically and both the extension and retraction of the gear is controlled by a single lever. Hydraulic pump power is obtained either from the main power plant or from an auxiliary engine, but hand operation is possible, if necessary.

The landing gear has a number of advantages in addition to the obvious one of greatly extending the scope of utility for the Model 28. For rough water taxiing the extended gear greatly assists in control by serving as a sea anchor. More engine power may be applied for short turns without undue acceleration, and turns on the water may be accomplished with far less skidding. Naturally, all danger of scraping the keel on the ramp is eliminated, and no beaching crew is required, for the ship can climb a ramp or beach under its own power. It may operate from sand beaches with no special ramps or facilities for handling.

Since the side wheels are above water when the ship rises on the step, and since automatic means are provided for expelling water from the closed bow wheel hatch before the plane is in the air, the flying trim remains unaffected. Repairs or routine servicing to the landing gear may be made with a minimum of trouble. The beaching gear lugs of the Model 28 have been retained, so that a standard beaching gear may be attached and the plane run out of water. This lifts the landing gear clear of the ground so that any servicing may be carried out.

CURTISS Falcon Trainer



Designed specifically for the training of "fighting pilots" the new, all-metal Curtiss Falcon 22 two-place basic combat and all purpose trainer has been contracted for by a foreign government. The plane has just completed flight tests and while no details concerning its performance are available, it is powered by a Wright Whirlwind 9-cylinder engine, incorporates a wing of special design which provides greatly improved stall and spin characteristics and is equipped with retractable landing gear. Provision has been made for all types of training activities, including gunnery, bombing and instrument flying. This ship is smaller than the well-known Curtiss Hawk 75A pursuit but incorporates the latest in structural design. The wing is of the full-centilever type and is all metal with multiple spars, having an internal structure of longitudinal stiffiners, shear spars and fore and aft bulkheads which are riveted to the skin; and is constructed in five separate units. The center panel contains two fuel tanks with a total capacity of 68 gallons, are located near the center line.

AVIATION FINANCE

REVIEW OF FINANCIAL PICTURE for 1939

By Raymond Hoadley

Who for the past fifteen years has been associated with the financial aspects of the aviation industry. During this time Mr. Hoadley has been writing several financial columns from Wall Street and is Aviation Editor of the New York News Bureau.

As a result of the unprecedented economic development which the aircraft companies experienced last year, the industry now ranks as "big business". The main factor contributing to this marked change in economic stature has been the greatly accelerated demand for military and commercial aircraft witnessed in the past twelve months. This has led to record-breaking shipments and unfilled orders, increased earning power and substantial expansion of production facilities. For the first time the opportunity has come for real assembly line operation sufficient to place the plane, engine and accessory manufacturers in the quantity production field along with most of America's great industries. It is one industrial group that appears assured of near capacity operation extending well into 1941, a unique and enviable position even in times of the most marked prosperity.

Reflecting a portion of this increased demand, shipments in 1939 were the highest in the industry's history. They amounted to around $200,000,000, more than one-third larger than the 1938 total of approximately $135,000,000. Three of the larger companies, Curtiss-Wright, Douglas and United Aircraft together late last fall had unfilled orders somewhat in excess of the estimated $335,000,000 deliveries of the entire industry in the past two years. Unfilled orders now at hand exceed the industry's shipments from 1934 to 1938 inclusive. While 1940 peak production will not be reached until early in the summer, it seems reasonable to expect that shipments this year will range upward from a conservative minimum of $400,000,000, an amount double the record level achieved in 1939.

The following table gives the total shipments and the relative proportion of export shipments from 1929 through 1939.

Aircraft Sales

Year	Total	Export
1929	$71,000,000	$9,100,000
1930	53,300,000	8,800,000
1931	49,100,000	4,800,000
1932	32,800,000	7,600,000
1933	33,200,000	9,100,000
1934	41,500,000	17,400,000
1935	41,500,000	14,200,000
1936	76,800,000	23,800,000
1937	110,000,000	39,400,000
1938	*135,000,000	68,200,000
1939	*200,000,000	*105,000,000

* Estimated.

A glance at the industry's order book easily explains the optimism felt in the trade regarding the 1940 shipment volume. The aircraft companies entered 1939 with a collective backlog of around $160,000,000. At the close of the year unfilled orders had risen to approximately $600,000,000, nearly half of which were received in the fourth quarter. As in 1938 and 1939 more than 50% of current orders are for foreign delivery.

In the first quarter of 1939 nearly $100,000,000 in foreign orders were received. By late summer the U. S. Army Air Corps had placed practically all contracts under its huge new aircraft armament program, the awards totaling $151,800,000 plus options of an additional $7,400,000. The Navy also had contracted for nearly $14,000,000 of its $38,000,000 appropriation for the 1939-40 fiscal year. Then in the early fall the United States air transport companies ordered some $24,000,000 of new equipment. The final buying wave came with the post-embargo orders from the Allied countries, estimated at approximately $170,000,000.

The sharp increase in volume of orders received last year can be seen in the following table showing the approximate unfilled orders of several major companies on December 1, 1939 and on December 31, 1938.

Company	1938	1939
Allison	$500,000	$17,500,000
Aviation Corp.	*.........	11,300,000
Bell	3,675,000	7,500,000
Boeing	14,894,000	27,000,000
Consolidated	2,796,000	18,000,000
Curtiss-Wright	31,000,000	150,000,000
Douglas	23,000,000	76,000,000
Grumman	3,500,000	4,500,000
Lockheed	30,000,000	27,000,000
Martin	13,903,000	53,000,000
No. Amer. Av.	10,914,000	47,000,000
Republic	*.........	10,000,000
United Aircraft	17,464,000	125,000,000
Total	$151,646,000	$573,800,000

* Not available.

Conditioned on continuation of the European War, it would appear that the industry will have an even larger backlog of orders at the close of 1940 than it has today. Great Britain and France, particularly the latter, will wish a continuous supply of American aircraft for the duration of the war. Looking ahead to 1941, France already has taken six month options on equipment for delivery next year. For the present at least, Great Britain probably will not be as large a war customer as France. The English may feel they have two or three months leeway in which to decide just how much outside aid they will require. They are represented as feeling that if the struggle lasts through the winter the chances are that it will be a long war. In that event Great Britain would come into the American market in a more substantial way. European neutrals, such as Norway, Sweden, Holland, Belgium, Portugal, Turkey, etc., are overseas prospects for fairly substantial orders. Italy alone remains an active competitor of the United States for the foreign trade. Air missions from South America are visiting domestic aircraft plants in increasing numbers.

The 1939 Army Air Corps program is not scheduled for completion until June 1941. In the meantime there is every indication that this program will be supplemented by further substantial orders this year. It is expected that Congress also will be asked to increase the authorized strength of the naval air force 100%, or from 3,000 to 6,000 planes, to be built over the next two or three years. A large appropriation will be requested to begin this new program. Within the next three years the United States hopes to have an air force of some 12,000 planes whose annual replacement requirements would be substantially larger than the air defense expenditures of recent years.

Additional transport orders may lag over a rather protracted period due to the rush of orders from the airlines last fall in anticipation of 1940 traffic requirements. However, continued rapid traffic gains, the charting of new routes, and plane retirements may lead to quite substantial purchases again next fall. Eastern Air Lines and American Airlines may follow Pan American Airways, T. W. A. and United Airlines into the four-engine transport field. Foreign airlines will continue to look to the United States for equipment. In the private plane group prospects this year are considered excellent. In the first six months of 1939 private sales amounted to 1,362, as against 602 in the like 1938 period. For the full year it is estimated sales totaled

---

NAVY ORDERS PLANES TO COST $20,000,000

N.Y. TIMES 12/20/39

Consolidated Signs Agreement Covering Production Charges

Special to THE NEW YORK TIMES.

WASHINGTON, Dec. 20—A $20,016,669.60 Navy Department airplane contract was awarded today to the Consolidated Aircraft Corporation of San Diego, the second subject to the 12 per cent profit-limiting provisions of the Vinson-Trammell Act as amended by the National Defense Act. At the same time the Treasury Department stated that it had signed an agreement stipulating how some items may be handled in computing costs.

The agreement provides that, for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed during the performance of the contract.

It also provides that the company may charge off as an indirect factory expense the depreciated cost, less salvage value, of buildings which must be demolished in order for the company to carry out the contract. The cost of making the demolition is also to be charged as an indirect factory expense.

With respect to any buildings, machinery, or other similar facilities which must be acquired by the company to perform the contract, the agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction with respect to the portion permanently discarded upon completion of the contract.

The allowance permitted with respect to the cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and for the salvage value at that time.

The deductions allowed with respect to these new facilities and the demolition of old facilities are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

BY THE WAY

With BILL HENRY

L.A. TIMES 1-22-40

UP IN THE AIR—Old-time flyers wandering out onto Lindbergh Field at San Diego these days rub their eyes when they see the enormous airplanes which loom up like dinosaurs and pterodactyls alongside normal craft. Business is certainly booming. They have 3500 men working at Consolidated and are likely to have nearly three times that many in another year. The enormous new Army bomber—sh-h-h-h—looks to be super-terrific. It'll carry so many people it'll need an usher to direct traffic. It'll probably upset Boeing's business in "flying fortresses," which will make V. P. Ed Gott feel terrible, no doubt. He used to be with Boeing. They've another enormous seaplane which is the only admiral's flagship in existance and still another that must belong to the guppy family. Makes you feel a bit bloated to look at it.

The Navy's Newest Patrol Bomber Arrives for Tests

T. N. SANDIFER

RATED AS THE WORLD'S LARGEST AMPHIBIAN AIRPLANE, Consolidated Aircraft Corporation's newest patrol bomber for the Navy, the XPBY-5A, roared up from Pensacola Naval Air Station, on December 16, to land without circling at the Anacostia, District of Columbia, air station for a series of performance flights by naval pilots there.

Flown by Lieut. Carl E. Giese, with Lieut. Roy Jackson as co-pilot, both Navy flyers, and with a Navy crew aboard, as well as Consolidated's mechanical expert G. R. Tibbs, the huge ship made the hop in 6½ hours, as the final lap of a transcontinental journey from the West Coast plant where she was built.

Long-range flights over land or ocean are a part of this big plane's heritage. Basically this is Consolidated's Model 28, two-engined flying boat, which in service as a Navy patrol bomber type has established a remarkable series of mass flight records, and other sustained performance records. The latest of the type is therefore a continuation of the series which has made mass flight records to Hawaii, Panama, and over other distances.

This particular plane, which probably will set the pace for others of similar capabilities, is able to fly from San Francisco to New York, and continue on for 1,000 miles beyond, and has other possibilities about which the Navy is decidedly uncommunicative. The new Model 28-5A Amphibian, as it is officially designated, is in fact, decidedly a mystery ship.

A hardy newsman, after the plane's arrival at Anacostia, soon found this out when he asked one of the pilots what his plane's top speed is.

"Sorry, I can't say," was the answer. All the record shows is that the ship took off from San Diego, Calif., December 14, and made overnight stops at Randolph Field, Texas, and Pensacola.

Some commonplace details are available; the ship is a high wing monoplane, all-metal construction, of an approximate gross weight of 12 tons, but capable of taking off with a much heavier load. It has a wing spread of 104 feet, is 65 feet overall, and has wingtip floats which are retractable.

The ship is powered with two Pratt & Whitney *Twin Wasp* engines, but the Navy and its builders are chary of any more detailed facts about technical equipment, including its armament. The big plane has a gun turret forward of the cockpit, in addition to other armament.

* *

A CONSPICUOUS FEATURE OF THE BIG PLANE as it stands on a landing field is one of its most visible points of difference from certain other types of patrol bombers. This is its new tricycle landing gear, which, like its wingtip floats, is retractable and covered by flush metal hatches when the plane is in flight.

This item of the plane's construction is important, so far as the plane's service qualifications are augmented. As will be shown in a detailed explanation of this device, the new landing wheels, in addition to the wing floats, make the plane remarkably versatile. It not only can operate at sea, and with much greater seaworthiness in some respects, because of this land equipment, but can be used inland, as it is equally able to take off from a land station, as from the water.

New Air Bases and Depots Named

PURSUANT TO THE RECOMMENDATIONS of a Board of Officers appointed by the Chief of the Air Corps, new Army Air Corps Stations which are formed, or in the process of being built, have been named as follows:

Northeast Air Base, Holyoke, Mass.—Westover Field, named for the late Maj. Gen. Oscar Westover, former Chief of the Air Corps.

Southeast Air Base, Tampa, Fla.—MacDill Field, named for the late Col. Leslie MacDill, Air Corps.

Bruja Point Air Base, Panama—Howard Field, named for the late Maj. Charles H. Howard, Air Corps.

Puerto Rican Air Base—Borinquen Field, so named because it is the original name of the island of Puerto Rico and its inhabitants were called Borinquenos or Borincuas.

Sacramento Air Depot, Calif.—McClellan Field, named for the late Maj. Hez McClellan, Air Corps.

Ogden Air Depot, Utah—Hill Field, named for the late Capt. Ployer P. Hill, Air Corps.

The plane is thus adapted to service under many different conditions, especially in remote ocean areas where it might be required to operate from some island base, lacking any of the usual requisites for such purpose. First, the landing gear on this new plane makes it independent of a beaching crew. The new ship can climb up a ramp from the water under its own power, if it has landed offshore, or if there is no ramp, it can roll up a beach. It can descend a ramp, or a beach, with perfect safety because of brake power, in the same way.

* *

THIS EQUIPMENT enables the plane to utilize atolls and remote beaches with the same facility as the more formal ramps and landing fields of the mainland. Furthermore, the gear is so constructed, and so operated, as to be easily serviced, and the whole plane is so designed, in fact, as to require a minimum of servicing, and that only such as can be given under active operating conditions.

It will be recalled that the Navy has paid particular attention to the possibilities for its patrol bombers in operating under service conditions from such advance bases as those being developed in Alaska, or those which might be improvised in the Caribbean or far Pacific, for instance. The latest in the series of Consolidated Model 28's therefore appears especially designed for duty of this nature.

Some of the secondary advantages of the landing gear addition relate more to its seagoing qualities perhaps than otherwise. For example, it was found that the extended tricycle gear, when the plane is on the surface of the water, has a stabilizing effect, acting as a sort of sea-anchor, and assisting to control the big hull when in open rough water, or facilitating the approach to a landing ramp or beach, against the wind.

In making turns within a short radius on open water, the pilot, by extending his landing wheels, acquires a sort of centerboard device which checks skid tendencies, and permits application of more engine power in turns, without undue acceleration.

* *

THIS TRICYCLE LANDING GEAR consists of a single wheel forward, with two aft. All three wheels are retractable by operation of a single lever, the wheels, supporting mechanism, including oleo shock struts, all disappearing into the hull, in wells which are covered by automatically closing hatches. When retracted, the hull presents a smooth planing surface, and as noted earlier, even the wingtip floats, for water use, are retractable.

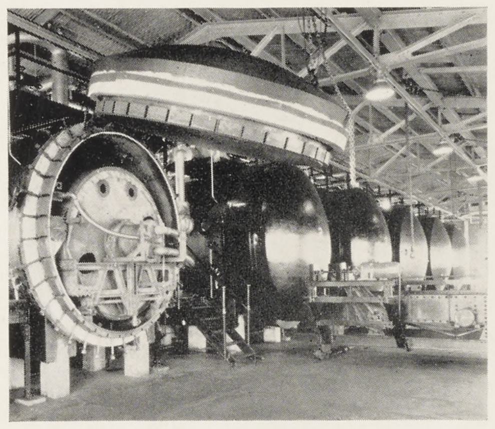
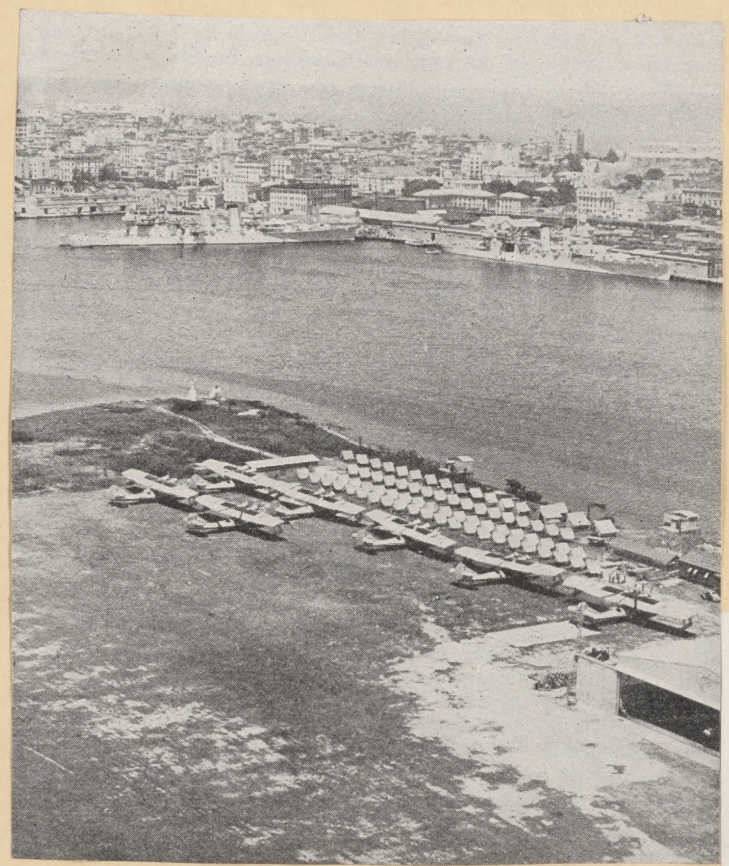
The giant machines are an important part of the modern Shell Refinery at Wood River, Illinois. At the right below is shown a Shell Service Station in Trinidad, off the coast of Venezuela in South America. Even in the tropics, Shell Stations are distinguished by their attractive appearance.





AMERICA PAYS FOR DEFENSE to keep Europe's war away, but that makes jobs for U. S. citizens. Ask a Harvard economist if it creates wealth. UPPER LEFT, Navy pitches camp in Puerto Rico, "Gibraltar of the Atlantic," to start its $10,000,000 airbase. Notice the seven PBY boats which daily patrol the mainland coast under the Neutrality law. BELOW, Future fighters of the Air Corps in caterpillar harness start for a training spin. RIGHT, Douglas hires 1600 men and women, breaks all its employment records, heads for a payroll goal of 12,000 by January; 17,000 by June, 1940. Aviation 12/39 over 3,000 planes. Private plane makers may soon become substantial factors in military training plane production.

The integrated companies—those making planes, engines and propellers—are the largest immediate beneficiaries from war orders. Curtiss-Wright and United Aircraft head this small group. The engine companies, being comparatively few in number, occupy a commanding position in the industry today. General Motor's Allison Engineering Co. is fully occupied with its large Army order. With respect to war orders, France and Canada are more dependent on the United States for motors than for planes.

Along with the record shipments and unfilled orders, the forthcoming annual reports of the aircraft companies will reveal 1939 earnings well ahead of those of the preceding year. Exceptions to this general statement among primary companies may be Bell, Boeing, Consolidated and Republic Aircraft, due to small shipments and large charge-offs in the case of Boeing. All four companies enter 1940 with substantially larger backlogs than a year ago. There were many instances last year where company earnings were the largest on record. Notable in this respect were Curtiss-Wright, Douglas, Lockheed, Martin, North American Aviation and United Aircraft. The Glenn L. Martin Co. experienced its best earning power in the fourth quarter. The others, as shown in the earnings table below, earned more in the first nine months of 1939 than in the twelve months of record earnings in 1938.

Net earnings of several major units in the industry for the first nine months of 1939, as compared with the full year of 1938, are contained in the following table.

Company	1939	1938
Boeing	†$2,606,100	†40,700
Curtiss-Wright	4,543,000	3,599,000
Douglas	2,382,000	2,147,000
Lockheed	*509,000	442,000
Martin	1,514,000	2,349,000
No. Am. Aviation	5,050,000	1,904,000
United Aircraft	5,799,000	5,426,000

† deficit.
* six months ended June 30, 1939.

Profits margins on sales for the primary companies averged substantially higher in 1939 than in other recent years. This may be attributed mainly to heavy deliveries for export on which the profit margin is usually higher than on domestic sales. Other factors in some cases were smaller charge-offs taken for the purpose of writing down the cost of new models, improvement in manufacturing methods and the higher efficiency and lower unit costs that naturally accompany larger production schedules. Until the arms embargo was repealed, it seemed likely that profit margins this year would trend lower due to the large deliveries slated for the United States Government. Profits on aircraft contracts placed with the Army and Navy are restricted to 12%. They have rarely, if ever, reached this maximum in the past and are unlikely to in the near future, although current restrictions are more liberal in several particulars than those formerly obtaining. However the recent wave of foreign buying indicates that profit margins this year will at least approximate 1939 levels. A gain is usually shown in the year following substantial plant expansion. This may augur well for increased profit per dollar sale in 1941.

Increased earnings this year have resulted in more and larger dividend payments to aircraft stockholders. Dividends declared by ten aircraft companies in 1939 (including only the Sperry Corp. in the accessory group) aggregated $20,500,000 as compared with $11,815,000 dispensed by eight companies in 1938, $6,980,000 by eight companies in 1937 and $3,780,000 by three companies in 1936. Initial dividends were declared by Lockheed and the Glenn L. Martin Co. For the first time Curtiss-Wright paid the full $2 a share to which the Class A stockholders are entitled in any given year before common dividends may be declared. North American Aviation, Sperry and United Aircraft increased their dividend disbursements for the third consecutive year. Douglas duplicated its 1938 payment of $3 a share. As a rule the aircraft companies do not establish regular dividend rates or make quarterly payments. Most dividend policies in the industry call for midyear and year-end payments or only one year-end declaration.

With some of the smaller companies becoming more firmly established and several companies having orders booked ahead from twelve to eighteen months, prospects are that somewhat larger dividend payments may be witnessed this year. The outlook for materially higher profits may permit the inauguration of dividends on the 7,429,000 shares of Curtiss-Wright common stock. Most companies probably will continue to plow back a sizeable portion of earnings into development work, plant improvement and working capital to finance an increased volume of business. Lockheed, for example, is understood to be using a substantial share of recent earnings from military deliveries to expand its transport building division.

From its inception in 1922 up through 1937 Douglas Aircraft paid out only 28.3% of its earnings in dividends, retaining the balance for plant expansion and the development of 31 experimental airplanes. Since the latter part of 1938 a more liberal dividend policy has been followed, it being felt that the company had reached a financial position where a major portion of profits might be distributed to shareholders. As company officials recently stated that no further plant expansion was contemplated in the near future, it appears likely that stockholders will share liberally in the record earnings that appear in prospect this year.

Early in 1939 there was a wave of plant expansion which by midyear had increased the floor space of plane factories by 18% and engine factories by 32%. This increase in facilities was undertaken in anticipation of the new Army aircraft program then before Congress. Large export orders held by a few companies were also a consideration. The major portion of this expansion program was publicly financed, a number of companies going into the capital markets with offerings of preferred or common stock.

Large scale foreign war orders for rush delivery were the immediate reason for a second and larger wave of plant and equipment expansion in the fall. In the background was the feeling, held in both trade and military circles, that further expansion was desirable from the standpoint of national defense. In recognition of the added protection that a highly geared aircraft manufacturing industry affords the air forces of the nation, the tax agencies of the federal government are expected to make liberal allowances for the rapid depreciation of new plant and equipment which may be linked in with the national defense program.

So far the major part of the expansion activity which began late in 1939 has been financed from company working capital and advances from the Allied governments. There is some additional expansion under consideration by several companies which may result in public financing this year, on a larger scale than has been witnessed in the recent past and befitting the needs of a rapidly growing and more seasoned industry. Stockholders of Boeing Airplane Co. recently approved an increase in the company's authorized capitalization and directors have under consideration an offer of rights to shareholders to subscribe to additional stock. Boeing arranged bank loans last fall to meet working capital needs but its directors feel that funds for working capital and plant expansion should be provided principally through equity capital rather than large bank loans. Should a major unit like Boeing take the lead in entering the capital markets, there are numerous other aircraft companies that are likely to follow suit, including one or more of the private plane companies that have had notable gains in sales volume in the past year.

Companies that have taken large war orders have been at pains to secure provisions in the contracts which will protect the industry, as far as possible, from a short but severe deflationery period that conceivably might follow an early peace. The bulk of war orders received so far are non-cancellable in the event the war is terminated before deliveries are made. In some instances surcharges may be levied on each unit delivered to permit the full depreciation of war order plant expansion in one or two years. The industry is firmly convinced that the war will stimulate the peacetime use of the airplane.

The change from small order to quantity production brings with it new problems which must be successfully met in the next few months if, in fact, 1940 is to be the industry's "banner year". In such a sudden step-up in production bottlenecks may threaten in the procurement of machine tools, accessories and parts. Already there has been some difficulty in accelerating the delivery of such materials as aluminum alloy sheet, extrusions, castings and steel. With many factories doubling or trebling their forces in a few months time, the available supply of skilled and semiskilled labor may run low. Some of the large foreign contracts, while protecting the companies against rising material and labor costs, include penalties if deliveries are delayed beyond specified dates.

Recent expansion has brought the industry to a point where, according to a survey by the Aeronautical Chamber of Commerce, production capacity is estimated at 15,000 planes a year, nearly three times as great as the 5,500 planes capacity on January 1, 1939. Engine capacity is estimated at 16,000 units and it is predicted that motor builders will be able to produce at an annual rate of 25,000 units later this year.

Thus, after the false start of the 1920 boom, the industry has, in the short span of twenty years reached a sound maturity as it takes its place in "big business".

NAVY ORDERS PLANES TO COST $20,000,000

N.Y. TIMES 12/21/39

Consolidated Signs Agreement Covering Production Charges

Special to THE NEW YORK TIMES.

WASHINGTON, Dec. 20—A $20,016,669.60 Navy Department airplane contract was awarded today to the Consolidated Aircraft Corporation of San Diego, the second subject to the 12 per cent profit-limiting provisions of the Vinson-Trammell Act as amended by the National Defense Act. At the same time the Treasury Department stated that it had signed an agreement stipulating how some items may be handled in computing costs.

The agreement provides that, for the period of performance of the contract, Consolidated may charge off as an indirect factory expense the cost of tools consumed during the performance of the contract.

It also provides that the company may charge off as an indirect factory expense the depreciated cost, less salvage value, of buildings which must be demolished in order for the company to carry out the contract. The cost of making the demolition is also to be charged as an indirect factory expense.

With respect to any buildings, machinery, or other similar facilities which must be acquired by the company to perform the contract, the agreement expressly refrains from fixing rates of depreciation and obsolescence, but permits the company to take a deduction with respect to the portion permanently discarded upon completion of the contract.

The allowance permitted with respect to the cost of any facility permanently discarded is subject to adjustments for depreciation and other allowances to the date the facility is discarded and for the salvage value at that time.

The deductions allowed with respect to these new facilities and the demolition of old facilities are not permitted to be treated as direct charges against the contract, but are to be prorated to all new work which the company may have.

BY THE WAY

With BILL HENRY

L.A. TIMES 1-22-40

UP IN THE AIR—Old-time flyers wandering out onto Lindbergh Field at San Diego these days rub their eyes when they see the enormous airplanes which loom up like dinosaurs and pterodactyls alongside normal craft. Business is certainly booming. They have 3500 men working at Consolidated and are likely to have nearly three times that many in another year. The enormous new Army bomber—sh-h-h-h—looks to be super-terrific. It'll carry so many people it'll need an usher to direct traffic. It'll probably upset Boeing's business in "flying fortresses," which will make V. P. Ed Gott feel terrible, no doubt. He used to be with Boeing. They've another enormous seaplane which is the only admiral's flagship in existance and still another that must belong to the guppy family. Makes you feel a bit bloated to look at it.

The Navy's Newest Patrol Bomber Arrives for Tests

T. N. SANDIFER

RATED AS THE WORLD'S LARGEST AMPHIBIAN AIRPLANE, Consolidated Aircraft Corporation's newest patrol bomber for the Navy, the XPBY-5A, roared up from Pensacola Naval Air Station, on December 16, to land without circling at the Anacostia, District of Columbia, air station for a series of performance flights by naval pilots there.

Flown by Lieut. Carl E. Giese, with Lieut. Roy Jackson as co-pilot, both Navy flyers, and with a Navy crew aboard, as well as Consolidated's mechanical expert G. R. Tibbs, the huge ship made the hop in 6½ hours, as the final lap of a transcontinental journey from the West Coast plant where she was built.

Long-range flights over land or ocean are a part of this big plane's heritage. Basically this is Consolidated's Model 28, two-engined flying boat, which in service as a Navy patrol bomber type has established a remarkable series of mass flight records, and other sustained performance records. The latest of the type is therefore a continuation of the series which has made mass flight records to Hawaii, Panama, and over other distances.

This particular plane, which probably will set the pace for others of similar capabilities, is able to fly from San Francisco to New York, and continue on for 1,000 miles beyond, and has other possibilities about which the Navy is decidedly uncommunicative. The new Model 28-5A Amphibian, as it is officially designated, is in fact, decidedly a mystery ship.

A hardy newsman, after the plane's arrival at Anacostia, soon found this out when he asked one of the pilots what his plane's top speed is.

"Sorry, I can't say," was the answer. All the record shows is that the ship took off from San Diego, Calif., December 14, and made overnight stops at Randolph Field, Texas, and Pensacola.

Some commonplace details are available; the ship is a high wing monoplane, all-metal construction, of an approximate gross weight of 12 tons, but capable of taking off with a much heavier load. It has a wing spread of 104 feet, is 65 feet overall, and has wingtip floats which are retractable.

The ship is powered with two Pratt & Whitney *Twin Wasp* engines, but the Navy and its builders are chary of any more detailed facts about technical equipment, including its armament. The big plane has a gun turret forward of the cockpit, in addition to other armament.

✣ ✣

A CONSPICUOUS FEATURE OF THE BIG PLANE as it stands on a landing field is one of its most visible points of difference from certain other types of patrol bombers. This is its new tricycle landing gear, which, like its wingtip floats, is retractable and covered by flush metal hatches when the plane is in flight.

This item of the plane's construction is important, so far as the plane's service qualifications are augmented. As will be shown in a detailed explanation of this device, the new landing wheels, in addition to the wing floats, make the plane remarkably versatile. It not only can operate at sea, and with much greater seaworthiness in some respects, because of this land equipment, but can be used inland, as it is equally able to take off from a land station, as from the water.

The plane is thus adapted to service under many different conditions, especially in remote ocean areas where it might be required to operate from some island base, lacking any of the usual requisites for such purpose. First, the landing gear on this new plane makes it independent of a beaching crew. The new ship can climb up a ramp from the water under its own power, if it has landed offshore, or if there is no ramp, it can roll up a beach. It can descend a ramp, or a beach, with perfect safety because of brake power, in the same way.

New Air Bases and Depots Named

PURSUANT TO THE RECOMMENDATIONS of a Board of Officers appointed by the Chief of the Air Corps, new Army Air Corps Stations which are formed, or in the process of being built, have been named as follows:

Northeast Air Base, Holyoke, Mass.—Westover Field, named for the late Maj. Gen. Oscar Westover, former Chief of the Air Corps.

Southeast Air Base, Tampa, Fla.—MacDill Field, named for the late Col. Leslie MacDill, Air Corps.

Bruja Point Air Base, Panama—Howard Field, named for the late Maj. Charles H. Howard, Air Corps.

Puerto Rican Air Base—Borinquen Field, so named because it is the original name of the island of Puerto Rico and its inhabitants were called Borinquenos or Borincuas.

Sacramento Air Depot, Calif.—McClellan Field, named for the late Maj. Hez McClellan, Air Corps.

Ogden Air Depot, Utah—Hill Field, named for the late Capt. Ployer P. Hill, Air Corps.

✣ ✣

THIS EQUIPMENT enables the plane to utilize atolls and remote beaches with the same facility as the more formal ramps and landing fields of the mainland. Furthermore, the gear is so constructed, and so operated, as to be easily serviced, and the whole plane is so designed, in fact, as to require a minimum of servicing, and that only such as can be given under active operating conditions.

It will be recalled that the Navy has paid particular attention to the possibilities for its patrol bombers in operating under service conditions from such advance bases as those being developed in Alaska, or those which might be improvised in the Caribbean or far Pacific, for instance. The latest in the series of Consolidated Model 28's therefore appears especially designed for duty of this nature.

Some of the secondary advantages of the landing gear addition relate more to its seagoing qualities perhaps than otherwise. For example, it was found that the extended tricycle gear, when the plane is on the surface of the water, has a stabilizing effect, acting as a sort of sea-anchor, and assisting to control the big hull when in open rough water, or facilitating the approach to a landing ramp or beach, against the wind.

In making turns within a short radius on open water, the pilot, by extending his landing wheels, acquires a sort of centerboard device which checks skid tendencies, and permits application of more engine power in turns, without undue acceleration.

✣ ✣

THIS TRICYCLE LANDING GEAR consists of a single wheel forward, with two aft. All three wheels are retractable by operation of a single lever, the wheels, supporting mechanism, including oleo shock struts, all disappearing into the hull, in wells which are covered by automatically closing hatches. When retracted, the hull presents a smooth planing surface, and as noted earlier, even the wingtip floats, for water use, are retractable.

LOFTING *Speeds* PRODUCTION *for* CONSOLIDATED

By Thomas J. Coughlin
Chief Loftsman
Consolidated Aircraft Corporation

Production efficiency begins long before the shop begins cutting up material. Here's how one big West Coast company simplifies things for the shop by adopting an old ship-yard technique.

With the urgent need for aircraft manufacturers to speed up the processes of aircraft building from the inception of design to the delivery of the finished product, methods are being sought constantly which will bring about this result. While the urge is desirable, the means taken to accomplish this end must be aligned with good engineering and must produce sound results or it is wasted effort.

Quite often there is available a supply of skilled workmen who may be 'poured on' to the mechanical phase of constructing and assembling the first of a new design airplane. The full brunt of three shifts of men may be brought to bear if necessary. But this means of rushing completion of the initial airplane is generally not applicable to that phase of the work where the major slow-up occurs, which is in the intermediate work between engineering stage and shop, when a multitude of detail drawings and the construction of necessary tools, forms and layouts are concerned. It is here that there is a tremendous amount of drafting labor and shop conversion work which often has been the "bottle-neck" at the beginning of production. The very nature of this phase of preliminary production work has resulted in considerable pressure being built up at this stage, tending to hold back orderly progress to smooth production.

The lofting approach to this phase of development has proved a boon in relieving this pressure, since it materially speeds up the whole transition process of converting an engineering conception into direct factory aids for workmen, such as tools and fixtures. The method previously accepted has been to transmit to the shop engineering directions through numerous detail drawings. The drafting problem alone, while using this procedure, can become tremendous, especially in the development of large aircraft.

Prior to the adoption of lofting methods, the recording of a shape on paper by the engineering department was usually done on a smaller scale than the actual. The shop had to translate each such drawing back to full scale before constructing any needed forms, assembly boards, fixtures or other necessary shop aids. Variations would result from individual interpretations, particularly where a faired line or double curvature was involved. Difficulties consequently followed in assembly and elsewhere.

Lofting, being a more natural intermediary, and particularly because it is conducted first hand and to full scale, not only eliminates a large percentage of the difficulties experienced with previous methods, but materially reduces the number of engineering drawings ultimately necessary.

Lofting has another advantage over the older method and a rather subtle one, in that it brings the engineering personnel into a more direct contact with shop processes and problems. The full value of this factor is difficult to estimate, but it is considerable. There are many men in aircraft engineering departments who have not had the advantage of shop experience. Due to the current urgent need of trained technical men they are often snatched up at the completion of their formal education and set to work without an intermediate shop phase. Lofting lifts the fog that is apt to descend upon such embryo engineers who have not had their training mellowed through shop experience. The more intimate shop contacts afforded through the medium of lofting serves as a refreshing stimulant for engineers and draftsmen alike, and opens another important bond between shop and engineering. This, of itself, results in closer cooperation and a speeding up of the transition phase from initial engineering to line production.

Above: A general view down the Consolidated lofting department.

Lofting as applied to aircraft production follows the practise used in ship building. This applies to laying out of hull or fuselage bulkheads, beltframes, etc., on a full size scale. In addition, aircraft lofting is applied to the wing, tail, furnishings and armament groups.

The work done by lofting for each group may be broken down into the following categories:

1. Lines: The actual laying out of the shape of hull, fuselage, wing, tail, etc.
2. Assembly Boards: Laying out the assembly boards from which work may begin immediately.
3. Templates: For layout, drilling, marking, shaper work, etc.
4. Form blocks: Wood or metal, for forming two-way curvatures and odd shapes.
5. Drop Hammers: All parts laid out for $\frac{1}{8}$th inch or $\frac{5}{16}$ inch shrink for drop hammer work.
6. Flat patterns.

Briefly, here is how lofting works: Starting with the preliminary design of the airplane in engineering; the beam, overall length, and the height of hull or fuselage are determined, after which a small scale drawing is made showing the desired shape. Next, centerline drawings of the wing structural parts, such as bulkheads, beltframes, and spars are made and the structural sizes determined. From this point the lofting department, which works as an integral part of engineering, takes up the work and lays down and fairs a full size body plan (vertical sections), full size water lines (horizontal sections), buttock lines (longitudinal sections), and any diagonal or special sections necessary to make a completely faired job. No tolerance is allowed in this work as every line must check perfectly with all others related to it. In this manner the lofting department produces a set of master plans, and from these all subsequent lofting work is built. The contour of any part, as for example a beltframe, is lifted from the master plan and transferred directly to a layout board.

After the contour is singled out from the master plan and on a board of its own, and is checked for accuracy, the structural members are drawn directly on the surface of the layout board. By this procedure of transferring from the master plan to layout boards a great number of layouts can be made to progress simultaneously, all originating from the one full size master plan.

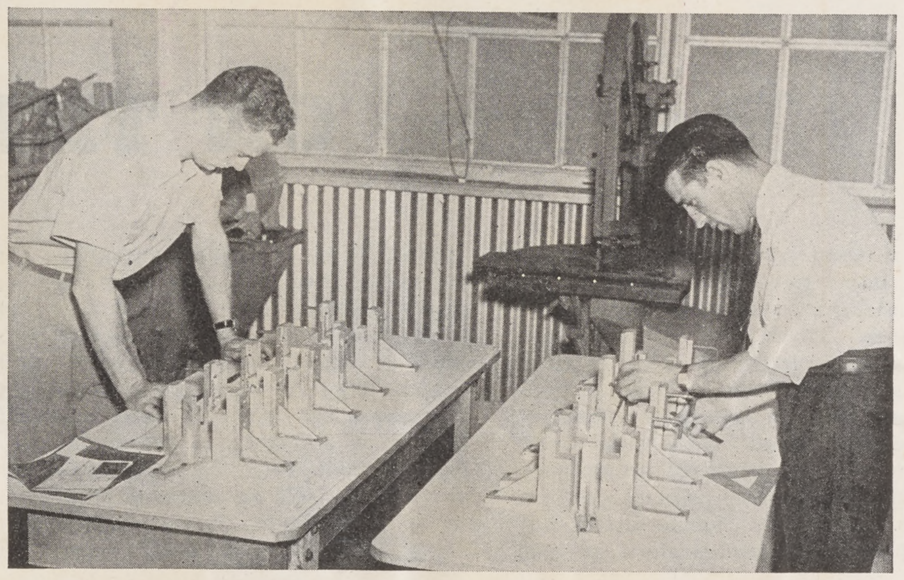
From the contour and structural layout board, the necessary drill templates locating all rivets and cutouts are laid out and sent to the shop for completion. Where locating fixtures are required the tool design department is notified so that the fixtures will be available when required. The lofting department likewise furnishes the contours for all bumping forms, master layouts required by tool design, and templates required for parts procured by sub-contract outside the parent plant.

The layout boards are used in the making of several kinds of templates: marking templates, drill templates, mark and prick punch templates, drop hammer templates, shaper form templates, templates for form blocks, etc. These are all checked back directly against the layout board and the structural information it carries.

The lofted layout board is then turned over to the tool department to

(~~Turn to page 88~~)

(BELOW)



Right: A lofted layout board becomes an assembly board by the addition of blocks to hold the work in place. Assembly boards here being checked.

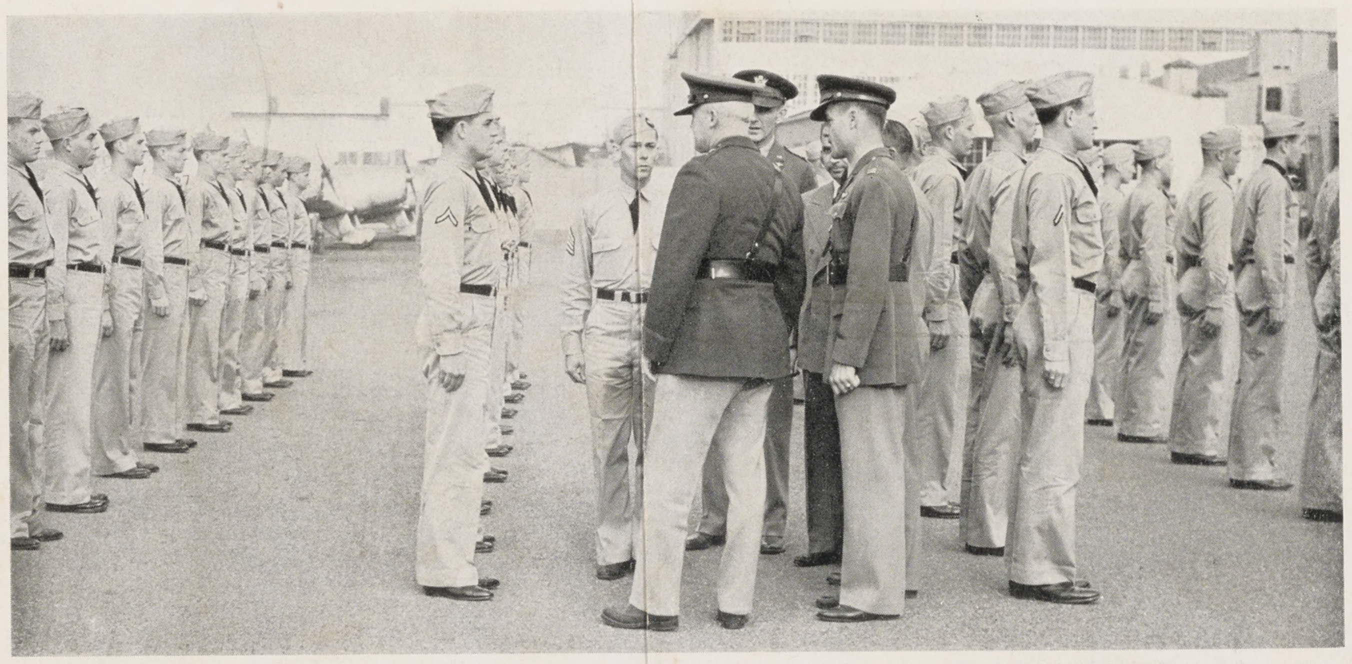
Lofting

(*Continued from page 35*)

have form blocks put on it. These blocks transform the layout board directly into an assembly board, by providing three-dimensional support for the various members which are to become a part of the assembly. Since the templates for the various parts were taken from the lofted layout board, and the tool department worked directly on this original layout (or drawing), and since this is all full scale work, there is slight room for error or misinterpretation. As a matter of fact, the layout phase has been completely eliminated for the tool builders, with obvious economy of time and effort.

The lofting method lifts from engineering a good deal of tedious drafting, makes the actual full scale layout and hands it to the shop for construction. Lofting likewise lifts from the tool and shop departments the work of expanding detail drawings to full scale before attacking tooling. Likewise, the lofting method greatly facilitates rapid construction of preliminary mock-ups.

An example of what can be done with the aid of lofting may be given in the case of the most recent engineering achievement at Consolidated; design and construction of the twin engined, 52-place Model 31 flying boat. Only ten months were required to design, construct, and test fly this entirely new ship, whereas previous development projects dealing with flying boats of comparable size, have required two years or more. While this particular case should not be taken as a direct comparison between various current planes, and the time taken to produce them—since each new model has its own special problems—nevertheless it may be taken as a fair example of the net benefits obtained through application of lofting methods to the process of initial development of new aircraft designs.



MAJ. GEN. H. H. ARNOLD, CHIEF OF AIR CORPS, INSPECTS FLYING CADETS AT AIR CORPS TRAINING DETACHMENT, RYAN SCHOOL OF AERONAUTICS, SAN DIEGO, CALIF.

Consolidated's Twenty-Million-Dollar Navy Contract—Notes

ONE OF THE LARGEST single orders for planes under the present national defense aviation expansion program was announced by the Navy Department on December 22, in the award of a $20,016,669.60 contract to the Consolidated Aircraft Corporation, of San Diego, Calif., for additional numbers of that company's Model 28, which is in use by the Navy as that Service's standard patrol bomber.

As noted elsewhere in this issue, the Navy now has an advanced amphibian version of this big plane at the Anacostia, D. C., Naval Air Station for service performance tests, but it is understood that the present order is for the standard Consolidated ship, such as this company has supplied the Navy for use as patrol bombers in current service.

There is every reason to believe the Navy is well satisfied with this particular model, based on performances of squadrons of these ships in mass flights to Hawaii and Panama. It will be recalled that more recently a squadron of Navy patrol bombers flew across the Pacific to the Philippine Islands, making two stops after leaving Hawaii. These, it is known, were Consolidated's basic Model 28, the famous PBY's.

The Navy confined announcement of its order to the bare fact of the award, as it no longer specifies number of ships, nor the type and number of engines.

⁂

Other Awards

CONTRACTS totaling $9,384,881 for aircraft engines and propeller assemblies were awarded by the Navy on December 19.

Pratt & Whitney Aircraft division of United Aircraft Corporation was awarded a $7,927,000 contract for engines, and the Hamilton Standard Propellers division received a $1,293,000 contract for propeller assemblies.

Curtiss-Wright Corporation's propeller division also was awarded a $163,000 contract for propeller assemblies.

⁂

The Sperry Gyro-Horizon and The Directional Gyro

AN ATTRACTIVE NEW BOOKLET has just been published by the Sperry Gyroscope Company entitled *The Sperry Gyro-Horizon and The Directional Gyro*. It is a 26-page catalog describing these two basic flight instruments, showing how this equipment is arranged and also the principal dimensions. It is profusely illustrated with actual size photographs of the instruments as well as pictures of typical installations.

Copies of this booklet will be sent free to interested parties on request of the Sperry Gyroscope Company, Manhattan Bridge Plaza, Brooklyn, N. Y.

An Interesting Map

THERE IS HANGING ON THE WALL OF THIS OFFICE an unusually interesting as well as instructive map showing the air routes of the world. It is published by the Hydrographic Office, Navy Department, Washington, D. C., and copies may be obtained at 50 cents each. On the map is also shown a table of routine flights made since January 28, 1937 by Consolidated Model 28 flying boats of the U. S. Navy. Commercial models have circled the earth at its maximum diameter, have crossed oceans and continents nonstop, have operated in climes from the Tropics to the North Pole, all without undue incident.

⁂

Aviation Employment Increases

THE NUMBER OF BOEING SCHOOL GRADUATES placed in the aviation industry during the month of October showed a three-hundred-per-cent increase over October a year ago, according to data released by the placement department which is supervised by Herbert Marsh. Nineteen young men received employment as compared with six in the same month in 1938. The increase is attributed to the rapid expansion of the industry and the active assistance given to graduates by the placement department of Boeing School.

Richard Cooley, Arthur Schumann, and Robert Trembley were employed as first officers by the flight department of United Air Lines. Other graduates were placed with airlines and factories as airplane, engine, and instrument mechanics, meteorologists, traffic agents, etc.

Seek Big Fund For Larger S. D. Base

The sum of $2,000,000 for the navy's seaplane base at San Diego is included in supplemental budget estimates sent by President Roosevelt to congress for appropriations totaling $34,267,381 for 16 federal agencies, The International News Service reports from Washington, D. C.

The $2,000,000 is a San Diego harbor project, an undertaking of the war department, according to The Associated Press, which stated that in his request the president concurred in a budget bureau statement that existing world conditions made it advisable to complete the San Diego harbor dredging project as soon as possible.

Comdr. James T. Mathews (CEC), 11th naval district public works officer, reported the $2,000,000 would be used "possibly for dredging and other facilities for navy patrol plane operations here."

Speed-Up Expected

Rumors have been current on the waterfront most of this month that because of the existing unsettled world conditions the government might speed up the port's $4,184,000 dredging project. Initial work was done last year by the Hydraulic Dredging Co.'s dredge Tualatin. Standard Dredging Co. is ready to start work on an $800,000 portion of the major project.

Other funds requested by Roosevelt include:

Six million dollars for Central valley project, California; $8,000,000 for Grand Coulee dam; $1,000,000 for Boulder canyon dam generating plant; $5,125,000 for the census bureau; $1,017,000 for state department expenses growing out of the war; $400,000 for another trans-atlantic weekly mail plane trip after July 1 and $1,500,000 compensation for persons injured or killed on government relief projects.

Striving to accommodate applicants unable to visit the employment office in the daytime Consolidated Aircraft Corp. will open its employment office at 1254 India st., Thursday and Friday nights from 6 to 10, Edgar Gott, company executive, reported yesterday.

The office is open daily except Saturday and Sunday, from 7:30 a.m. to 4:30 p.m. Gott, stressing that the corporation wishes to employ local residents, said applicants should have some knowledge of mechanical work. He said Consolidated expects to have a gradual increase in employment in the next 12 months.

Approve $118,649 For S. D. Airport

TRIBUNE SUN 1-30-40

A project calling for construction of hangars, control station buildings, seaplane facilities and a wharf at Lindbergh field at a cost of $118,649 was given presidential approval in Washington, D. C., yesterday, Rep. Ed V. Izac notified chamber of commerce officials in a telegram today.

The project, said Izac, is sponsored by the harbor department. Izac's telegram follows:

"Pleased to advise our WPA project alloting $118,649 improvement municipal airport Lindbergh field and streets adjacent thereto just approved Presidential Letter D2019. Includes construction hangars, control station building, seaplane facilities, wharf, floats and ramp, all power and lighting facilities other incidental work. Sponsored by city harbor department."

Consair Plans $1,500,000 Plant Expansion

UNION 2-2-40

Expenditures of approximately $1,500,000 in construction of new buildings at its Lindbergh field plant was announced yesterday by Consolidated Aircraft Co.

Piling for the new structures, which will increase the plant capacity by 85 percent, is being driven. Steel assembly is expected to be started next month.

The expansion program comprises additions to the final assembly, final finish, paint and wood mill shops, experimental, maintenance and office departments. Sawtooth roof construction similar to the existing buildings will be used.

Officials announced that 3900 workers are now employed at the plant, with about 3000 more to be added when the new buildings reach peak production this spring.

17 CCC Aircraft Workers From Vista Camp on Payroll of Consolidated After Six-Month Course; Government Trains Youths for Aeronautics With New Classes Starting Soon; 50 in Each Group

TRIBUNE-SUN 1-30-40

S. D. County Is Hub Of New Educational Plan, Say Officials

Seventeen CCC-trained aircraft workers have been placed on the payroll of Consolidated Aircraft Corp., coming here directly from the Vista CCC camp after a six months' training course in the camp under the direction of George E. Irvin, aircraft instructor, and Willard T. Day, camp educational advisor.

"This is the first attempt in San Diego county at turning out CCC boys in wholesale quantities for aircraft employment," said Day. He said that from time to time various southern California aircraft companies have been placing youths trained in CCC camps, but that the Vista plan is "the first major attempt in wholesale planning and placing after a training course has been completed."

Seven More at Ryan

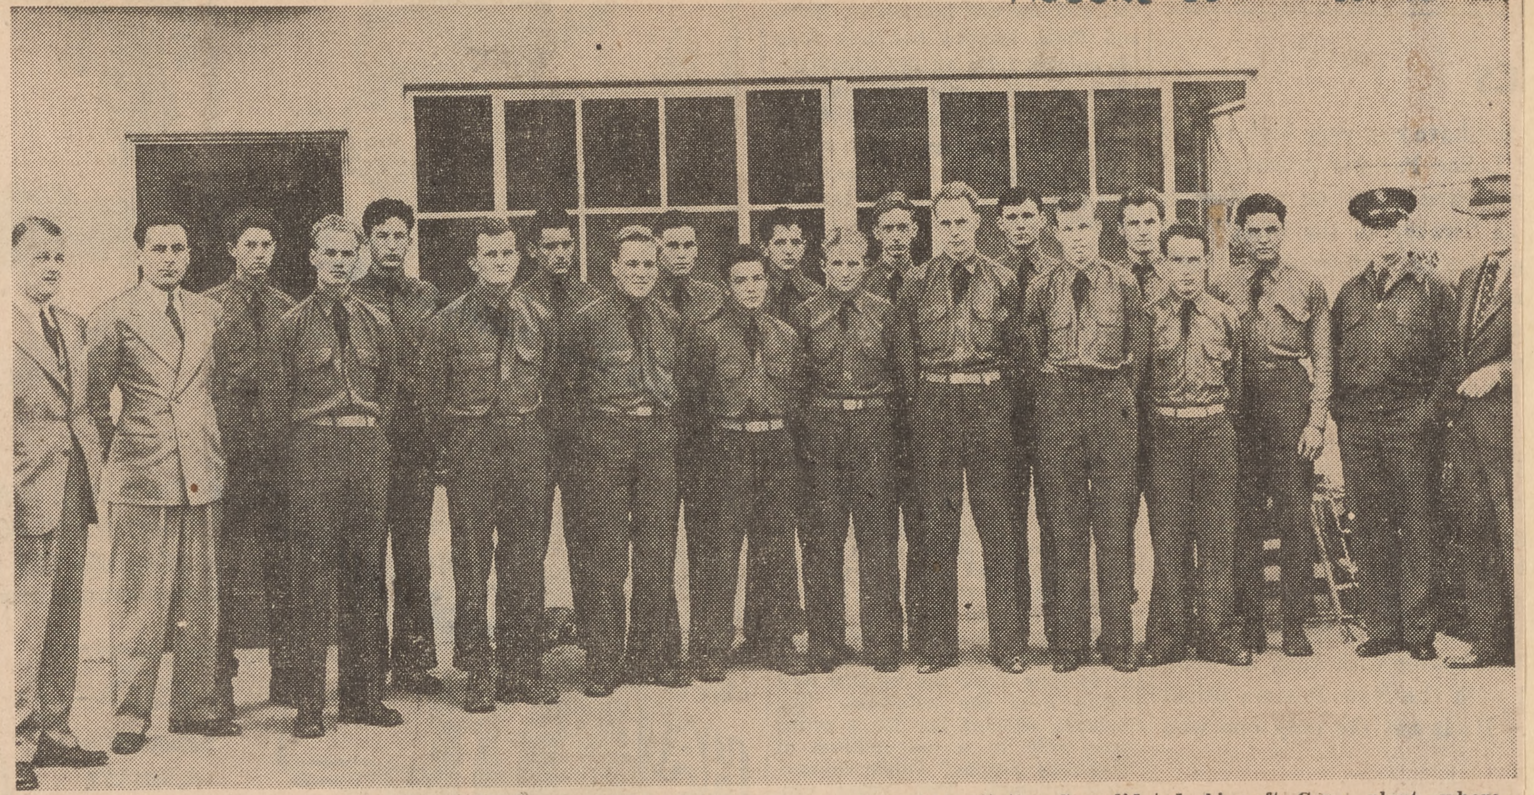
Day reported that in addition to the 17 from the Vista CCC camp placed at Consolidated this month, seven from the same camp have been placed at the Ryan Aeronautical Co. in the same period. He said 10 more young men will be graduated soon from the school and possibly will receive jobs in some San Diego aircraft factory. New classes starting this month will graduate youths by April 1, and it is expected that each graduating class will be composed of not less than 50 students.

J. P. Waterbury, representative of Consolidated Aircraft Corp., conducted a special tour of inspection for the new aircraft employes after they had been placed on the firm's payroll. He declared that employes taken from CCC camps are well-trained in work habits and discipline.

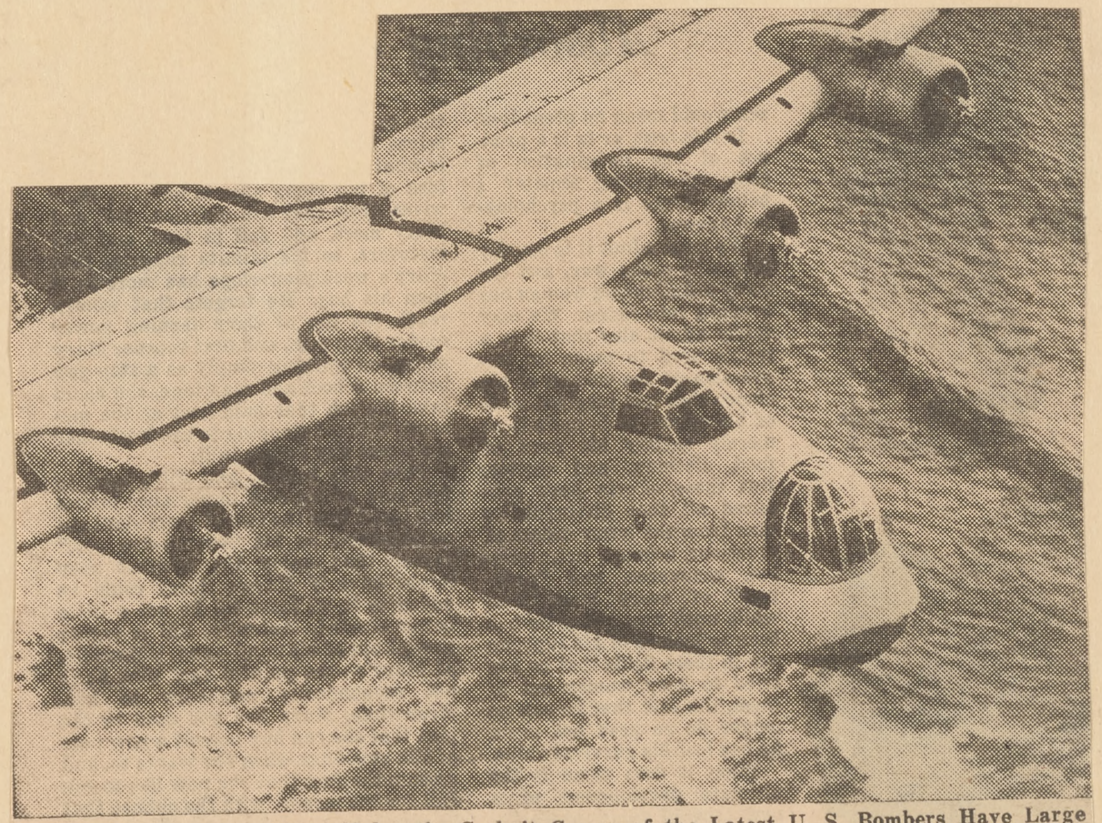
Only Mechanics Wanted

The course in aeronautical engineering and mechanics has been in operation at the Vista CCC camp for the past six months. It is the only CCC camp in San Diego county offering this training, although similar training is given in some of the CCC camps in Los Angeles county. All boys interested in applying for the CCC training course must apply through the San Diego county CCC selecting agency, department of public welfare, Civic Center.

Consolidated officials report that only men with knowledge of mechanical work are being employed by the firm, which has opened a new employment office at 1254 India st. The 17 CCC youths were reported the last to be employed at the firm's former employment office, which was located at the north end of the Consolidated plant.



Vista CCC camp graduates of the camp's aeronautical training class are shown here at the Consolidated Aircraft Corp. plant, where they were given employment this month. Front row, left to right: J. H. Waterbury, of Consolidated; Harry M. Webster, department of public welfare; Hershel L. Whiting, Frederick J. Gianola, Richard L. Ward, Walter E. Hansen, Robert A. Parker, James W. Holes, Anthony Zitnick, Howard E. Taylor, Willard T. Day, CCC educational advisor, and George E. Irvin, aeronautical instructor. Back row, left to right: William C. Fry, Fenton L. Stuck, Leon Basso, Dionisio Molina, John F. Burcham, John C. Stephens, William K. Warren, Frank C. Taylor and Arthur G. Islas.



Instead of Armor-Plated Peep Holes, the Cockpit Covers of the Latest U. S. Bombers Have Large Expanses of Plexiglass Affording Larger Areas of Vision, Better Light and Just as Much Protection as Metal Coverings.

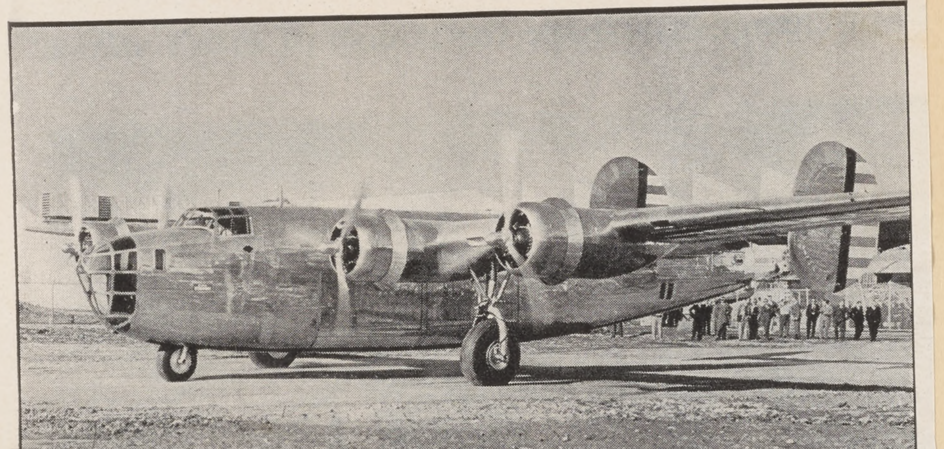
Consolidated Aircraft Tests a Fast New Army Bomber



Wide World

This Consolidated Aircraft army bomber attained a speed of 325 miles an hour—near top speed for planes of its type—in its initial test flights at San Diego, Calif., recently. Consolidated, builder of navy amphibian and patrol planes, has incorporated several new features in the four-engined, 5,000-h.p. land bomber—including a tricycle landing gear for greater safety, "perfect curve" wings for greater speed.

FISH WANTS CONSOLIDATED TO HELP PAY FOR CROSSINGS

UNION 1-24-40

Belief that Pacific highway pedestrian underpasses or overpasses should be constructed for use by Consolidated Aircraft Corp. employes, and that the factory should share in the expense, was expressed yesterday by Herbert Fish, city councilman. His remarks were spurred by a recommendation from Fred Rhodes, city manager, that the dedicated-but-never-opened stub-ends of Redwood and Spruce sts., between California st. and the mean high tide line, be closed, as asked by Consolidated, and that cost of proceedings be paid by the corporation.

CHANCE FOR SWAPPING

Discussion disclosed that if this were done, the closed parts would revert to Consolidated, as the owner of abutting property.

"Here's a chance to do some swapping," said Fish. "Consolidated wants three sets of traffic signals installed on Pacific highway. I think underpasses or overpasses would be better, and that the factory, in return for the land it would receive from the closings, should help pay for the pedestrian walks."

Glenn Rick, city planning engineer, said planning and harbor commissions favor the closings.

"As long as Pacific highway is an arterial, it is advisable to have as few intersections as possible," he said.

QUESTION TABLED

On motion by Fish, seconded by Harley Knox, the question was tabled "indefinitely." The council then referred to the planning commission R. E. Hazard's request that Maple st. be closed between Kettner blvd. and California st.

"There is no connection, nor prospect of one east from Kettner blvd. on account of the topography of the ground," he wrote. "A great overpass west from Kettner blvd. to Pacific highway would have to be built to ever open it up in that direction."

Aircraft Classes Organized by City Schools

UNION 2-6-40

Organization of special classes to speed instruction of students in work being made available in local aircraft factories, was started by the Vocational school yesterday, Will C. Crawford, city school superintendent, reported.

Joseph E. Merk, first of the expert workmen to be released temporarily by Consolidated Aircraft Corp. to serve as instructor, reported yesterday. A second instructor, Edward D'Amico, is expected to check in today. Six instructors have been asked from Consolidated, while Claude Ryan, head of another factory, told Crawford yesterday he hoped he would be able to supply two teachers.

PLAN SPECIAL STUDIES

Purpose of the augmented activity in vocational education is to train local persons for the jobs becoming available as the aircraft factories step up production to meet big orders.

The special classes will concentrate on instruction in riveting, sheet metal work, pattern work, blueprint reading and welding.

Morning, afternoon and evening classes will be scheduled, and with eight instructors it was estimated that 600 students a month could be turned out with fair knowledge of the jobs which are becoming available. Aim of the school is to make this added employment available locally instead of drawing in persons from outside.

'COOPERATION VITAL'

Crawford reported to the board of education yesterday, however, that whether or not San Diego men are trained through the Vocational school for aircraft jobs depends upon cooperation of aircraft industries in providing instructors.

"We can provide classrooms and equipment," said Crawford, "but only those can teach aircraft who know aircraft. Those men are employes of the industries. If they can be released and lent to us, we can do what the chamber of commerce advises us that it wishes done. If they are not, we can't. The whole program hinges upon whether or not the industry supplies us with the teachers for the classes—a matter which does not seem to have been quite clear to some."

ARCHBOLD SEEKS BUYER FOR GUBA; WAR HALTS PLANS

UNION 2-6-40

Guba, the famous round-the-world flying boat which has been resting in an airline hangar at the municipal airport since it completed its globe-girdling and exploration work last summer, may never fly again under the ownership of Richard Archbold, scientist, who bought it from Consolidated Aircraft Corp.

Word came from New York yesterday that Archbold is looking for a buyer for the famous craft, which is an adaptation of the noted navy PBY flying boat line. Archbold had planned further foreign explorations with the Guba but has given them up for the duration of the war, when he may again come to San Diego for a new ship.

Guba is the second flying boat Archbold purchased here. The first was transferred to the Russian government for use in search for one of its fliers lost in an attempted Russia-to-America flight.

Consair Job Office To Open Evenings

UNION 1-30-40

Striving to accommodate applicants unable to visit the employment office in the daytime Consolidated Aircraft Corp. will open its employment office at 1254 India st., Thursday and Friday nights from 6 to 10, Edgar Gott, company executive, reported yesterday.

The office is open daily except Saturday and Sunday, from 7:30 a.m. to 4:30 p.m. Gott, stressing that the corporation wishes to employ local residents, said applicants should have some knowledge of mechanical work. He said Consolidated expects to have a gradual increase in employment in the next 12 months.

AIRCRAFT SCHOOL LAGS BEHIND LOCAL NEEDS, CHAMBER WARNS

UNION 2-2-40

The expansion program at San Diego's vocational school, as outlined by Will C. Crawford, superintendent of schools, at a meeting of chamber of commerce directors yesterday, will not be adequate to meet the demand for aircraft employes in San Diego plants by next July 1, chamber officials stated last night.

Crawford stated that "under our expansion program we will be able to train 150 students a month, and through special classes provide an additional 150 trained youths every 30 days." Chamber officials pointed to the fact that on this basis not more than 1500 will be turned out of the vocational school by July 1, while the aircraft firm's demands for employes will be in excess of 3600.

"This will mean that our local plants will be forced to employ more than 1500 out-of-town men," Frank Forward, chamber president, said he had been advised by the chamber's education committee members. "San Diego is not in a position to accommodate this great influx of out-of-town help when, within the confines of our own county, there are hundreds of men seeking vocational training to equip themselves for this type of industrial activity."

AN EXAMPLE

Tom Bomar, chamber aviation department manager, reported that Consolidated officials "the other day employed 41 men, 15 of whom were from a school at Glendale."

"This is just an example of one day's employment at the local aircraft plant," Bomar said, "and indicates the immediate need for an

Can't Train Enough S. D. Workers For Consolidated, School Plaint

Demands of Consolidated Aircraft Corp. for trained workers will exceed the supply to be obtained through San Diego vocational training school, chamber of commerce directors were told yesterday.

School facilities are being expanded to train 150 students a month and, through special classes, provide an additional 150 every 30 days, said Will C. Crawford, superintendent of schools.

Chamber officials were informed the firm's demands for employes will be in excess of 3600 by July 1, while the expansion program at vocational school will be able to turn out not more than 1500 by that time. will be able to turn out not more than 1500 by that time.

"This will mean that our local plants will be forced to employ more than 1500 out-of-town men," Frank Forward, chamber president, said he had been advised by the chamber's education committee members. "San Diego is not in a position to accommodate this great influx of out-of-town help when, within the confines of our own county, there are hundreds of men seeking vocational training to equip themselves for this type of industrial activity."

Glendale Men Hired

Tom Bomar, chamber aviation department manager, reported that Consolidated officials "the other day employed 41 men, 15 of whom were from a school at Glendale."

"This is just an example of one day's employment at the local aircraft plant," Bomar said, "and indicates the immediate need for an adequate training program to qualify San Diego youths for these jobs."

Bomar said that local aircraft firm officials "prefer to hire San Diegans whenever possible."

Crawford, in his outline of the proposed school expansion, stated that "inability to obtain competently trained instructors has delayed us in effecting the expansion we desire."

Plan Special Classes

"Beginning next Monday, the vocational school will be in a position to turn out 150 students a month, and through special classes which will be started, an additional 150 can be trained each 30 days," Crawford said. "Our concern now is to set up a course which will lead directly to employment. We realize that the ultimate objective of our educational system is to get young people happily into work."

The superintendent said that "creation of the vocational training school was not a 'fly-by-night' program, but rather resulted after an intensive study of the vocational needs of the community." He reviewed some of the vocational activities which now are being conducted under the San Diego school system, including industrial and commercial fields.

Chamber officials warned that unless adequate training is provided in the aircraft field the number of persons now being brought to San Diego from Glendale and Kansas City schools will increase.

Directors were told, after a discussion of the matter by members of the chamber's executive committee, that "Mr. Steinmetz of the State college faculty had been stirring up opposition to the vocational training program of the city schools, especially that part of the program relating to supplying the quota of San Diego youths to the Consolidated Aircraft Corp."

Maj. T. C. Macaulay, chamber executive secretary, told the directors that "reports to our organization indicate that since Mr. Steinmetz was acting as spokesman of the left-wing elements of the C.I.O. his opposition was receiving more attention in certain quarters than it merited."

Crawford was assured by Maj. Macaulay that "this community stands solidly behind a vocational program adequate to qualify the hundreds of young men who seek employment in industry."

"Our chamber of commerce is interested in but one thing," Forward said, "and that is to do all in our power to encourage sufficient training so that San Diego, not out-of-town, young people will be afforded the waiting jobs in our local industry. Much of our unemployment problem, especially as it relates to young people, can be solved as a result of this great aircraft expansion. All possible must be done to train our local people for these positions. This emergency presents a challenge—a challenge which this community can and must meet."

The chamber praised Crawford for his efforts in meeting the emergency of training young people for industrial jobs, and voiced the hope that adequate instructors and facilities would be made available so that the local jobs could be filled by San Diegans.

Aircraft School Needs Outlined

(Continued from Page 1)

adequate training program to qualify San Diego youths for these jobs."

Bomar said that local aircraft firm officials "prefer to hire San Diegans whenever possible."

Crawford, in his outline of the proposed school expansion, stated that "inability to obtain competently trained instructors has delayed us in effecting the expansion we desire."

PLANS TOLD

"Beginning next Monday, the vocational school will be in a position to turn out 150 students a month, and through special classes which will be started, an additional 150 can be trained each 30 days," Crawford said. "Our concern now is to set up a course which will lead directly to employment. We realize that the ultimate objective of our educational system is to get young people happily into work."

The superintendent said that "creation of the vocational training school was not a 'fly-by-night' program, but rather resulted after an intensive study of the vocational needs of the community." He reviewed some of the vocational activities which now are being conducted under the San Diego school system, including industrial and commercial fields.

Chamber officials warned that unless adequate training is provided in the aircraft field the number of persons now being brought to San Diego from Glendale and Kansas City schools will increase.

OPPOSITION CHARGED

Directors were told, after a discussion of the matter by members of the chamber's executive committee, that "Mr. Steinmetz of the State college faculty had been stirring up opposition to the vocational training program of the city schools, especially that part of the program relating to supplying the quota of San Diego youths to the Consolidated Aircraft Corp."

Maj. T. C. Macaulay, chamber executive secretary, told the directors that "reports to our organization indicate that since Mr. Steinmetz was acting as spokesman of the left-wing elements of the C.I.O. his opposition was receiving more attention in certain quarters than it merited."

Crawford was assured by Maj. Macaulay that "this community stands solidly behind a vocational program adequate to qualify the hundreds of young men who seek employment in industry."

TRAINING ENCOURAGED

"Our chamber of commerce is interested in but one thing," Forward said, "and that is to do all in our power to encourage sufficient training so that San Diego, not out-of-town, young people will be afforded the waiting jobs in our local industry. Much of our unemployment problem, especially as it relates to young people, can be solved as a result of this great aircraft expansion. All possible must be done to train our local people for these positions. This emergency presents a challenge—a challenge which this community can and must meet."

The chamber praised Crawford for his efforts in meeting the emergency of training young people for industrial jobs, and voiced the hope that adequate instructors and facilities would be made available so that the local jobs could be filled by San Diegans.

Consair Starts On 87 Percent Expansion

TRIBUNE 2-1-40

As a result of a navy department contract to Consolidated Aircraft Corp. for $20,016,699, awarded Dec. 20, Consolidated is effecting an 87 percent expansion, aggregating approximately 396,000 square feet, according to report today at the plant. An announcement on the factory expansion was released as follows:

"The $20,016,699 contract from the navy department is the largest single order for airplanes ever placed by the United States government, and it increased the backlog of Consolidated to more than $40,000,000. With work on other contracts occupying most of the production capacity, the new record order has made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

"The present plant of Consolidated is one of the finest airplane manufacturing plants in the United

Continued on Page 4-A Col. 4)

Expansion Begun At Consair Plant

CONTINUED FROM PAGE ONE

States. When the company erected its new plant at San Diego the buildings were designed and constructed to meet the most advanced type of airplane manufacturing facilities. The original factory buildings are less than five years old and the large experimental building, the photo, physical and chemical laboratory and the paint storage and tool storage buildings are just over three years old.

To Cover 396,000 feet

"Prior to the expansion now under way, Consolidated had under lease 24.7 acres on which the factory buildings are located, and an additional 7.6 acres under option. New leases and options now cover an area of 64 acres. This area is all located on Lindbergh field, San Diego's municipal airport.

"The building expansion, comprising additions to the final assembly, final finish, paint shop, wood mill, experimental, maintenance and office departments, will aggregate approximately 396,000 square feet, or an increase in the present area of 87 percent. The largest single area to be roofed is the new final assembly building, measuring 360 by 720 feet. This has a clear span of 120 feet and a clearance from floor to roof truss bottoms of 36 feet. Sawtooth roof construction, similar to the existing buildings, will be used.

Yards To Be Paved

"In addition to the buildings, all factory yard areas will be paved with asphaltic concrete. These areas, due to the mild southern California climate, can be used virtually the entire year around for final assembly operations. Many maintenance activities likewise may be practically completed out of doors, and then transferred to the plant with a minimum of interference with production.

"In undertaking the plant expansion, which will enable the delivery requirements of the $20,016,699 contract to be met, a closing agreement between Consolidated Aircraft and the United States treasury department was entered into. This agreement provides that the cost of certain additional excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company.

Consair Aiding In Vocational Program

Training of 600 San Diegans a month to meet employment demands in the local aircraft industry is the new goal of the San Diego Vocational school.

It will be made possible through cooperation of the industry, with Consolidated Aircraft Corp. already having pledged aid in overcoming the major problem confronting educational executives here—lack of sufficient qualified instructors.

Consolidated will give immediate leaves of absence to two skilled workmen, who will be placed on the public school payroll for the duration of the emergency training program, Will C. Crawford, city schools superintendent, announced. Under the new arrangement, twice the number previously set as the vocational school's expanded capacity will be trained.

As each additional pair of instructors becomes available the capacity of the school will be increased 150 a month, Crawford estimated. This would require eight instructors, who should be assured their jobs in the aircraft business when their classwork is over, he added. The 600-a-month figure is adequate to care for expected needs, but could be expanded if necessary.

From the chamber of commerce, which had criticized a previous school program as inadequate and tending to draw in men from other cities while San Diegans were idle, came approval of the expanded program.

Chamber Favors Plan

"The chamber of commerce is happy to hear the news that 600 persons a month can be given this aircraft training," said Don Smith, chairman of the chamber's education committee. "We anticipate that the aircraft industry will continue cooperation with the schools by supplying the necessary skilled workmen as instructors and by assuring the workmen that they will have their jobs back when the instruction program ends."

Bud Waterbury, assistant personnel director of Consolidated Aircraft, who accompanied a chamber party in a tour of the vocational school yesterday, expressed belief that there would be no difficulty in obtaining complete cooperation between the schools and the company in making instructors available.

Prefer Actual Workers

"We prefer to have instructors in our classes who are now doing the sort of work the students would do when employed in aircraft factories," Crawford said in discussing the case. "We have been handicapped in getting good instructors. We don't want fly-by-nights, and the state law requires that the instructors qualified to teach in vocational schools have seven years' experience at their trade.

"We'd like to get instructors from Ryan and Solar as well as Consolidated, for the graduates of the school probably would be seeking work in those plants and would be familiar with their procedure. We had hoped to get the special aircraft classes going last week but there was difficulty in getting the first two instructors promised us. We have checked on the availability of instructors in other places but would much prefer to have local men do the teaching."

Crawford said there are 1000 or more names of prospective students on the school's waiting list and these would be assigned classes as rapidly as instructors are obtained.

Others Hard-Pressed

"We want to do all we can for the aircraft industry but we can't afford to cripple our work in other lines which also are hard-pressed," he went on. "For instance, the body and fender people tell us workers are leaving them to go into aircraft work, and they need workers now. The same thing is true in cases of men who know how to read blue prints, and in machine-shop work. These industries need help in training their workers also.

"The school system feels a responsibility to the community for all industry and wants to serve the best way possible."

Among those conferring on the vocational school matter and inspecting the school yesterday were Don Hanson, Lester G. Bradley, Smith, Irving Friedman, W. B. Whitcomb, Joe Dryer, Maj. T. C. Macaulay, D. W. Campbell, Tom Bomar, Earle Farnsworth, Charles Davies, Crawford and H. C. Tiemann.

City Weighs Consair Plant Traffic Puzzle

Sharp division of city council opinion developed yesterday as to advisability of further interrupting the flow of Pacific highway traffic by installing additional signals in front of Consolidated Aircraft Corp. plant.

Fred Rhodes, city manager, told the council the corporation had offered to contribute $1000 toward installation of signals to protect employes who use crosswalks at the north and south ends of the plant. These two sets of signals, he said, would be synchronized with the existing signal in front of the main entrance.

Discussion disclosed that when plant employment hits its peak, 3500 men will change shifts, and that these changes also will occur at hours when automobile traffic is the heaviest.

Councilman Herbert Fish expressed belief the state division of highways would not approve installation of the additional signals, but the council instructed Rhodes to confer with E. E. Wallace, district highway engineer.

School to Train 600 Monthly For Plane Jobs

Aircraft Industry Cooperating on New Project Here

An expanded vocational education program calling for cooperation of the public school system, the aircraft industry and the chamber of commerce to make 600 San Diegans available monthly for jobs making planes was outlined yesterday after a series of conferences.

This figure, double the highest previous estimate, will be possible through cooperation of the aircraft industry in supplying skilled workers to act as instructors, Will C. Crawford, city school superintendent, said. Consolidated Aircraft has promised two instructors, who already have received their school certificates and are expected to start classes Monday. The school system will pay their salaries and provide equipment and quarters for the classes.

TO TEACH 600 MONTHLY

As each additional pair of instructors becomes available the capacity of the school will be increased 150 a month, Crawford estimated. This would require eight instructors, who should be assured their jobs in the aircraft business when their classwork is over, he added. The 600-a-month figure is adequate to care for expected needs, but could be expanded if necessary.

From the chamber of commerce, which had criticized a previous school program as inadequate and tending to draw in men from other cities while San Diegans were idle, came approval of the expanded program.

CHAMBER FAVORS PLAN

"The chamber of commerce is happy to hear the news that 600 persons a month can be given this aircraft training," said Don Smith, chairman of the chamber's education committee. "We anticipate that the aircraft industry will continue cooperation with the schools by supplying the necessary skilled workmen as instructors and by assuring the workmen that they will have their jobs back when the instruction program ends."

Speed Bomber O.K. In Local Tests

The army announced today its huge new 20-ton XB-24 superbomber, built by Consolidated Aircraft corp., has completed initial flight tests at Lindbergh field successfully, The United Press reports from Washington, D. C. Army authorities said initial flights indicated the 40,000-pound, four-engined bomber will "live up to advancements" predicted for it, including a speed of more than 300 miles an hour, a cruising range of approximately 3000 miles and a bomb-carrying capacity of approximately four tons.

TRIBUNE 2-12-40

EXPLORER'S FAMOUS PLANE GOES ON AUCTION BLOCK

LOS ANGELES TIMES 2-5-40

NEW YORK, Feb. 4. (Exclusive) — The winged ship of a modern explorer—a huge flying boat which was the first to follow the equator around the world and helped discover a new tribe of 60,000 in a land of cannibals and head hunters—was put on the block this week.

His twin-motored United States Navy PBY bomber, the faithful Guba, is being sold because the European war caused postponement of plans for a fourth expedition to New Guinea this year, explained Richard Archbold, explorer and aviator. He is research associate of mammalogy at the American Museum of Natural History, and has studied animals and birds in far corners of the world for 10 years.

NEW GUINEA TRIP

Archbold and his Guba made aviation and scientific history during a 1938 foray into New Guinea which unexpectedly was extended to survey flights and a round-the-world journey which did not end until last July. They made record crossings of Australia, Africa and the Indian Ocean as well as spanning the Pacific and Atlantic Oceans.

Choosing the big bomber, with its 4200-mile cruising range, because he needed a large plane to carry men and supplies far to the interior of New Guinea, Archbold stripped her of armament and tossed superstition out the window in naming her.

SAVED BY RAFT

Guba, in a New Guinea dialect, means "sudden storm"—something which had wrecked a plane of his one night in the harbor at Port Moresby and forced the expedition to travel by raft to save itself.

While testing a first Guba in 1937, Archbold sold her at the request of the Soviet government for the rescue of Sigismund Leverevsky and a party lost in the Arctic, and for whom Sir Hubert Wilkins made a vain search. Archbold soon had a second Guba, however, and took off from San Francisco Bay June 2, 1938.

RETURNS TO U.S.

With Russell Rogers as copilot and Lewis Yancey as navigator, Archbold reached the expedition's base camp at Hollandia, Dutch New Guinea, eight days later after flying the Pacific via Hawaii and Wake Islands. From there supplies, Netherlands Indies soldiers, Dyak carriers and others of a party of 200 were flown to the inland base on Lake Habbema, 11,500 feet above sea level in the unexplored interior of New Guinea.

Returning to the United States after almost a year with many discoveries new to biologists, after discovering the new tribe and adding new lakes and valleys to the admittedly incomplete maps, Archbold was sidetracked at Sydney, Australia.

SURVEY FLIGHT

He agreed to make a survey flight of the Indian Ocean for the British and Australian governments for an alternate route between the two countries in the event of war. Capt. P. G. Taylor, co-pilot for the late Sir Charles Kingsford Smith, noted British flyer, came aboard as an official observer.

The Guba became the first flying boat to span Australia when it flew nonstop across to Port Hedland. From there the Guba made the first plane crossing of the Indian Ocean via the Cocos, Diego Garcia and the Seychelles islands to Mombasa, Africa.

CROSSES AFRICA

Then Archbold sent his craft on the first crossing of Africa by a flying boat. The Guba's hull rested en route in such romantic spots as Lake Victoria, the Belgian Congo and Nigeria before arriving at Dakar, Senegal, on June 26, 1939.

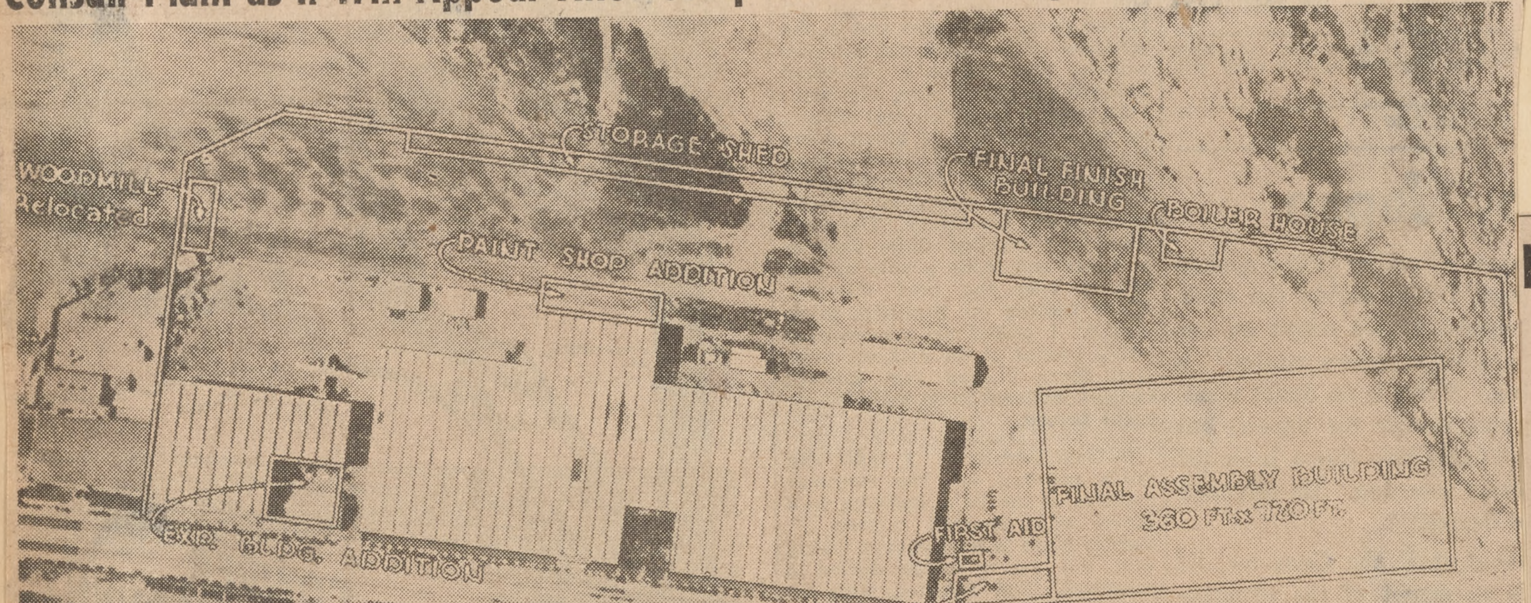
Three days later the Guba flew nonstop across the Atlantic to the Virgin Islands in what is said to have been the longest over-water flight of its kind at the time. The big flying boat landed on the waters of Jamaica Bay at Floyd Bennett Field, Brooklyn, on July 1. The unexpected around-the-world odyssey via the globe's widest diameter ended a few days later in San Diego.

WILL CONTINUE WORK

Sale of the Guba does not mean, however, that Archbold has given up exploring. It means only that he is postponing work in foreign fields "until the people of Europe decide to call a halt to killing each other," he said. He soon will announce plans for an expedition to a section of the United States where there still is much to be discovered by biologists, added Archbold.

TRIBUNE 2-12-40

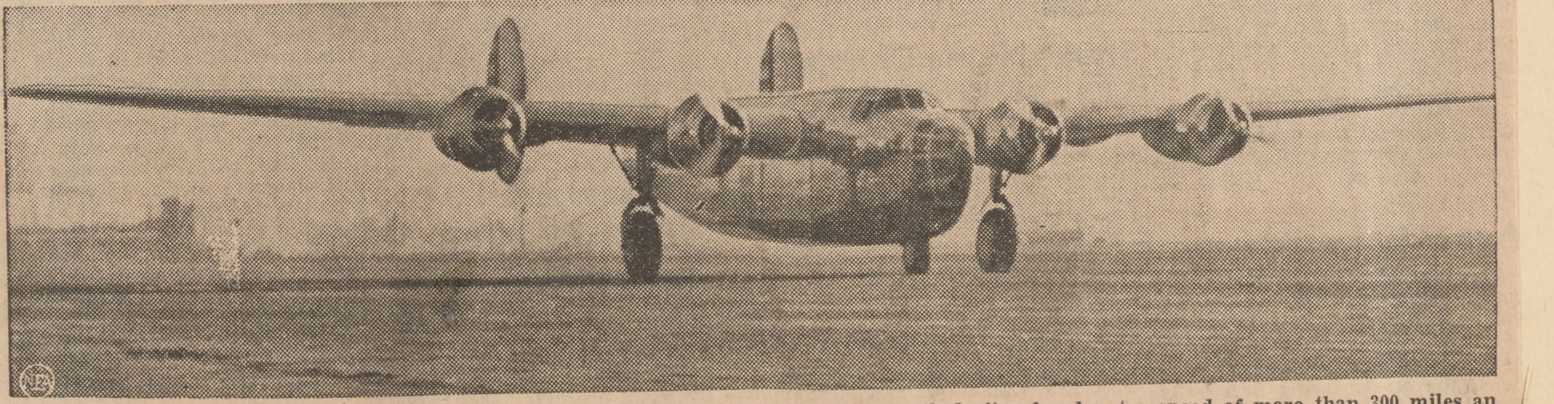
Consair Plant as It Will Appear After Completion of New Expansion Program



Air view looking down on the Consolidated Aircraft Corp. buildings, with outline drawing showing the expansion of the plant now under way to take care of increased navy orders. The largest new unit will be the final assembly building, 360 feet by 720 feet, adjoining the plant to the north and shown in the outline at the lower right. Between it and the main building will be a small office building and a first-aid structure. West of it, on the Lindbergh field side of the factory, will be the boiler house and final finish building. An addition is planned to the paint shop at the west side of the present main buildings, and another addition is being made on the experimental building, lower left. The woodmill will be relocated on the southwest corner, while a storage shed will be along the west side.

New Army Terror of Skies Makes First Test Flights at San Diego Field

2-13-40 TRIBUNE



America's newest sky terror, a huge bomber, capable of carrying four tons of death-dealing bombs at a speed of more than 300 miles an hour, is shown above after initial test flights at San Diego. It is a Consolidated Aircraft Corp. product, known as the XB-24. Army air corps officials, according to The Associated Press, state it has a range of approximately 3000 miles. Of all-metal construction, it is powered by four Pratt & Whitney 18-cylinder, twin-row, radial air-cooled engines, rated at 1200 horsepower each. Approximate gross weight is 40,000 pounds, wing span 110 feet and over all height, 19 feet. It will carry a crew of from six to nine. An official test board was dispatched to San Diego yesterday. The bomber is described in a report from Washington as a variation of a somewhat similar four-motored bomber, the B-17, of which the army has more than 50 in service or on order. The only experimental bomber with a greater capacity is the army's 37-ton "B-15," which last July 31 carried a payload of 15½ tons to an altitude of 8200 feet for a world record.

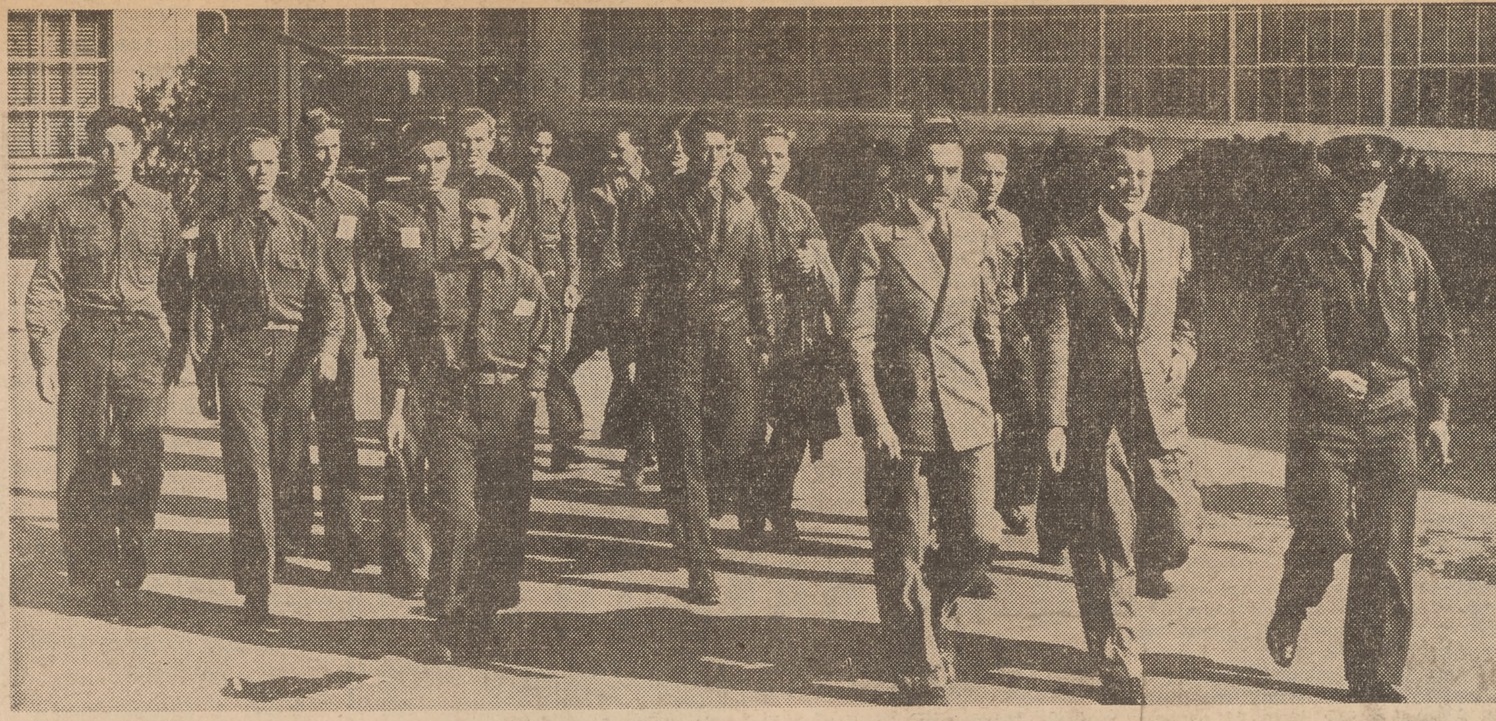
GRADUATES OF CAMP TRAINING CLASS TOUR CONSOLIDATED PLANT



Former civilian conservation corps enrollees, these new employes of Consolidated Aircraft Corp. make their first tour of the plant. Leading the group are (left to right) Harry W. Webster, departmeht of public welfare; J. H. Waterbury, Consolidated's assistant personnel director, and Willard T. Day, camp education adviser.

* * *

Aircraft Firms Take CCC Boys

Aircraft employes taken from civilian conservation corps camps are well trained in work habits and discipline, giving them a sound foundation for employment in aviation work, J. H. Waterbury, assistant personnel director, Consolidated Aircraft Corp., said yesterday.

Waterbury led 17 CCC-trained aircraft workers, placed on the Consolidated payroll after a six-month training course at Vista CCC camp aeronautical training school, on their first tour of the plant. Seven others were employed by the Ryan Aeronautical Co.

Willard T. Day, camp educational adviser, said employment of these youths marked the first time CCC workers had been trained for aircraft work in San Diego county. Ten more youths soon will be graduated from the school.

UNION 2-13-40

San Diego Bomber Passes First Tests

Initial tests of the new four-motored army bomber, built by Consolidated Aircraft Corp. here, have proved successful, the war department announced at Washington yesterday, United Press reported.

The big aircraft, with a wing span of 100 feet, and weighing 20 tons, is supposed to be fast enough to cross the continent in eight hours, thus making it the fastest bomber ever built for the army. It has been making performance tests over the city and county for more than a week.

The new air giant can carry a crew of six to nine men and a bomb load of four tons over a cruising range of 3000 miles, according to war department reports.

VOCATIONAL SCHOOL UNDERTAKES NEW PROGRAM

UNION 2-9-40

Space Marked For Aircraft Study Classes

Orders to clear additional space for special classes in aircraft making have been issued at Vocational school, 348 W. Market st., as arrangements were made yesterday to place 12 instructors in charge of the program to make San Diegans available for jobs in the local aviation industry.

Joseph E. Merk, first instructor to go on the job, is to be joined today by Edward D'Amico, another expert workman from Consolidated Aircraft Crop. Eight additional instructors are to report as soon as their papers are cleared through the state department of education which must certify the vocational teachers and two more are to be added when the classes are expanded to handle 600 new students monthly.

A gas engine works operating on school property adjoining Vocational school has been ordered to vacate to make room for the expanded classes. Classes are held daily from 8 to 12 and from 1 to 5, Walter L. Thatcher, coordinator for trade and industrial education under Eliot F. Landon, Vocational school principal, reported. Night classes from 7 to 9 are to be added as the program speeds up.

The special classes are part of the city's vocational training program. There is a $1 charge for registration and $5 partly to reimburse the school district for money spent for materials used by the students, Thatcher reported.

S. D. Plane Plants Employ 5365 With 4100 More Jobs by July, Plan

TRIBUNE 2-8-40

A total of 5365 men and women are employed at San Diego's three aircraft factories, the Consolidated, Ryan and Solar aircraft plants, representing a new peak in employment at all three plants, where backlog orders total more than $43,000,000. The total monthly payroll is $675,000, which exceeds the cost to the city for construction of Lindbergh field.

Consair Employs 4000

Consolidated has set an all-time employment high with 4000 workers and a monthly payroll of $500,000.

Solar employs 465 with a $50,000 payroll.

The Ryan Co., with 900 employes, an increase of more than 100 percent over its previous all-time high, has a monthly payroll of $120,000 exclusive of its army cadet flying school.

Executives of the three aircraft firms have advised the industrial committee of the chamber of commerce that approximately 4100 additional employes must be taken on before the factories reach their employment peaks about July. This would send the monthly payroll above the $1,000,000 mark, it was estimated.

Half Local Men

About half the men being employed are drawn from local sources and the remainder are being brought in from industrial centers where there are machinists, tool and die makers and other expert mechanics available. The 50 percent drawn locally is all the San Diego labor market offers, Tom Bomar, chamber of commerce industrial committee executive, said.

"We are hearing rumbles that men are leaving work in local fender, body and sheet metal plants to work at the factories," Bomar said. "There has been no serious dislocation, however, but our vocational training must give this factor consideration."

From fender, body, sheet metal and radiator plants came reports of a man here and another there going to the aircraft factory. The sheet metal business has been at a somewhat low ebb and no large staffs have been maintained by local firms.

Still More Needed

Virtually none of the outside workers have come from other aircraft centers, for these places are having experiences similar to those of the local factories.

Consolidated, which had 2630 employes six months ago, is now taking on workers at the rate of 200 a week.

Included in this total are 25 a week from a Kansas City technical school and another 15 from a Glendale training center. Consolidated expects to take on 3500 more workers by July, Solar about 100 and Ryan around 500, according to reports in industrial circles.

Local Men Called First

"There is apparently every disposition on the part of the manufacturers to give local men the call ahead of outsiders where experience is equal," Bomar said. "The trouble throughout the country is that there is no reservoir of aircraft labor to draw on."

Beginners are getting a minimum wage of 50 cents an hour, with the 40-hour week, it was reported. Skilled mechanics get the union scale, running above $1 an hour, it was added.

Rapid expansion of employment has resulted in speeding up the vocational school's special aircraft trade classes.

While local industrial leaders are happy at the rise in employment, they are concerned with the problem to be expected when the war-boom orders taper off and lay-offs begin.

TRIBUNE 2-14-40

Army Experts Here For Consair Tests

A group of 10 army majors and captains, from Washington, D. C., Dayton, O., and March field, and 10 civilian inspectors from the army's air corps material depot at Dayton, today began extensive inspection and flight tests of Consolidated Aircraft Corp.'s newest 25-ton, four-motored bomber.

Consair officials expected the tests to require about two weeks to complete. The big plane, designed for the army, is known as the XB-24, the designation it will carry until it is graduated from the experimental stage.

The bomber, which has a wingspread of 110 feet, is said to have a speed of more than 300 miles an hour, with a full load, and a range of 3000 miles. The all-metal ship is powered by four 1200-horsepower engines and will carry a war crew of nine. A feature is a tricycle-type landing gear. Upon final acceptance by the army, it probably will be flown to Dayton's Wright field.

Consair authorities also revealed that bids were opened yesterday on the projected plant expansion project, which, according to estimates, will cost about $1,800,000. They said results of the bidding would not be known until bidding data has been carefully checked, probably within the next day or two.

Army Officers To Fly Bomber

UNION 2-20-40

Army officials this morning formally will take over the huge Consolidated Model 32 four-motored bombing plane recently completed at the local plant, and which had its last test flight yesterday afternoon before delivery.

At the controls of the big plane—the XB-24—was William B. Wheatley, chief test pilot for Consolidated aircraft corp.; he was accompanied by Maj. Stanley Umstead who probably will pilot the plane from now on. Maj. Umstead and Maj. K. B. Wolfe of Wright field, Dayton, O., have been here to confer with Consolidated officials relative to delivery of the plane.

The plane, which has a wingspread of 110 feet and flies at better than 300 miles an hour, left the ground soon after 3 p. m., and was in the air three-quarters of an hour, circling over the bay, city and surrounding territory.

While no information relative to the plane's performance was released it was reported the tests were highly satisfactory.

Trib- 2-19-40

Cook Switches Plane To Patrol Wing 1

Transfer of his aerial flagship, the XPB2Y, to Patrol Wing 1 at North Island is announced by Rear Adm. Arthur B. Cook, commander aircraft scouting force. The plane, built by Consolidated, is four-motored, and will be used in training pilots and crews for the four-motored patrol bombers soon to be delivered by Consolidated to the navy.

NAVY'S FIRST AERIAL FLAGSHIP SHIFTED TO TRAINING DUTY

UNION 2-19-40

Rear Adm. Arthur B. Cook, commander of scouting force aircraft and the navy's fleet patrol wings in the Pacific, Caribbean and Atlantic, announced yesterday that his aerial flagship, the XPB2Y, has been transferred to Patrol Wing 1 at North island.

The huge four-motored Consolidated-built plane is to be used in training pilots and crews for the four-motored patrol bombers which Consolidated Aircraft Corp. soon will deliver to the navy.

Adm. Cook said the XPB2Y will not be used again as his aerial flagship. It is the first plane ever designated as a flagship.

Army to Open Tests Of Consair Bomber

UNION 2-19-40

First official army air corps tests of the XB-24, one of the world's largest and fastest bombers, will be conducted at Lindbergh field this morning, starting at 10, by 20 army aviators and technicians headed by Maj. K. B. Wolfe of Wright field, Dayton, O.

The Consolidated-built plane has completed preliminary builder's test flights by William B. Wheatley, Consair test pilot.

The 20-ton, four-motored bomber will make trial flights for the next 10 days. The plane, according to present plans, then will be flown to Dayton, O.

According to Washington advices, the army air corps is planning to award a $10,400,000 contract for 42 of the new bombers.

The XB-24 has a speed in excess of 300 miles an hour and can carry four tons of bombs 3000 miles without refueling.

3 S. D. PLANE PLANTS SET NEW MARK AS 5365 NOW EMPLOYED

Combined Monthly Payroll Is $675,000; Consair Taking on 200 Workers a Week

UNION 2-8-40

Reaching a new peak in employment in all three plants, officials of the Consolidated, Ryan and Solar Aircraft companies announced yesterday that a total of 5365 men and women are employed at the municipal airport factories. All three plants are employing more workers than any other time since they started in business. They are working virtually around the clock on backlog orders amounting to more than $43,000,000, company representatives said.

An interesting fact is that the total monthly payroll of $675,000 exceeds the amount it cost the city for construction of Lindbergh field.

4000 WORK AT CONSAIR

Consolidated has set an all-time employment high with 4000 workers and a monthly payroll of $500,000.

Solar employs 465 with a $50,000 payroll.

The Ryan Co., with 900 employes, an increase of more than 100 percent over its previous all-time high, has a monthly payroll of $120,000 exclusive of its army cadet flying school.

Executives of the three aircraft firms have advised the industrial committee of the chamber of commerce that approximately 4100 additional employes must be taken on before the factories reach their employment peaks about July. This would send the monthly payroll above the $1,000,000 mark, it was estimated.

S. D. FURNISHES HALF

About half the men being employed are drawn from local sources and the remainder are being brought in from industrial centers where there are machinists, tool and die makers and other expert mechanics available. The 50 percent drawn locally is all the San Diego labor market offers, Tom Bomar, chamber of commerce industrial committee executive, said.

(Continued on Page B, Col. 1)

(Continued from Page 1)

"We are hearing rumbles that men are leaving work in local fender, body and sheet metal plants to work at the factories," Bomar said. "There has been no serious dislocation, however, but our vocational training must give this factor consideration.

From fender, body, sheet metal and radiator plants came reports of a man here and another there going to the aircraft factory. The sheet metal business has been at a somewhat low ebb and no large staffs have been maintained by local firms.

OTHER PLANTS BUSY

Virtually none of the outside workers have come from other aircraft centers, for these places are having experiences similar to those of the local factories.

Consolidated, which had 2630 employes six months ago, is now taking on workers at the rate of 200 a week.

Included in this total are 25 a week from a Kansas City technical school and another 15 from a Glendale training center. Consolidated expects to take on 3500 more workers by July, Solar about 100 and Ryan around 500, according to reports in industrial circles.

LOCAL MEN PREFERRED

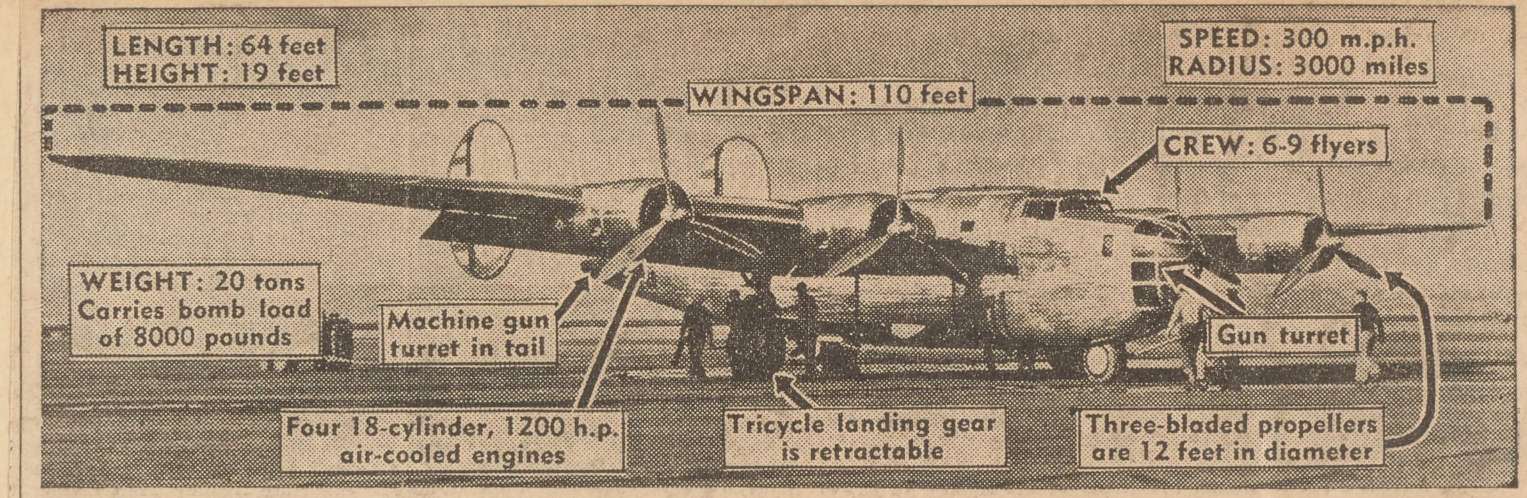
"There is apparently every disposition on the part of the manufacturers to give local men the call ahead of outsiders where experience is equal," Bomar said. "The trouble throughout the country is that there is no reservoir of aircraft labor to draw on."

Beginners are getting a minimum wage of 50 cents an hour, with the 40-hour week, it was reported. Skilled mechanics get the union scale, running above $1 an hour, it was added.

Rapid expansion of employment has resulted in speeding up the vocational school's special aircraft trade classes.

While local industrial leaders are happy at the rise in employment, they are concerned with the problem to be expected when the war-boom orders taper off and lay-offs begin.

Army Records Claimed for New Consair Bomber After First Tests Over San Diego



LENGTH: 64 feet
HEIGHT: 19 feet
SPEED: 300 m.p.h.
RADIUS: 3000 miles
WINGSPAN: 110 feet
CREW: 6-9 flyers
WEIGHT: 20 tons Carries bomb load of 8000 pounds
Machine gun turret in tail
Gun turret
Four 18-cylinder, 1200 h.p. air-cooled engines
Tricycle landing gear is retractable
Three-bladed propellers are 12 feet in diameter

Performance and military record of the new Consolidated-built United States army super-bomber, XB-24, is charted on photogram above, after initial tests at San Diego. An army test board arrived here from the east to inspect the craft.

Larson Bid Wins Consair Contract

UNION 2-15-40

To B. O. Larson, San Diego, with a bid of $209,000, yesterday was awarded the contract for construction of seven steel frame buildings by the Consolidated Aircraft Corp.

M. H. Golden submitted a bid of $210,284; E. F. Ryan, $220,268, and Charles L. Hoskins, $221,705. Five other contractors submitted bids ranging from $221,000 to $225,000.

The new structure, which will virtually double the plant's capacity, will include a final assembly building, addition to the paint shop, final finish building, boiler house, maintenance and storage shed, office and first-aid station.

San Diego Considered For Boeing Plant

TRIB 2-19-40

Officials of Boeing Aircraft Co. today disclosed that wage rates and labor relations factors were paramount considerations in the possibility the large airplane manufacturing firm may move its operations from Seattle to some other Pacific coast city, The United Press reported from San Francisco. San Diego, it is rumored, is being considered as a possible site for the plant. Officials of the firm said invitations had been received from San Francisco, Portland and "southern California cities and other communities."

HARBOR DRIVE AND NAVY EXPANSION PLANS MOVE AHEAD; 2 BILLS O. K.'D

UNION 2-20-40

Plans of the city to develop a scenic drive around the harbor and of the navy to expand local shore establishments moved forward yesterday when two bills were passed by the senate and sent to the house, International News Service reported.

One measure authorized the navy to accept land voted recently by National City for destroyer base improvements. The second bill, said Comdr. J. T. Mathews, 11th Naval district public works officer, included land grants and exchanges as approved by San Diegans at the spring primary and general elections last year. These included deeding to the navy of 40 acres in Balboa park for Naval hospital expansion; 14 acres northerly of and adjacent to the destroyer base, and four parcels, totaling 10 acres, between Harbor st. and Pacific highway and Broadway and Market st., and a small parcel south of navy pier.

The navy, in return, is to convey to the city 61.72 acres adjacent to Lindbergh field; a triangular piece of land on the west side of Pacific highway between E and F sts.; a strip of Naval Training station property for street improvement, and a triangular piece at the corner of Barnett ave. and Pacific highway. Another small piece of Marine base land near Water st. also is involved.

The government is to issue a revocable permit for a 200-foot-wide right-of-way for construction of Harbor dr. bordering the bay in front of Naval Training station and the Marirne base, and the navy department is to recommend and support the construction of a bridge to carry the drive across the mouth of a lagoon leading to the Marine base and training station if and when emergency appropriation funds are available.

Glenn Rick, city planning engineer, said some of the land the city will receive was provided under the last bay dredging contract, and that the rest of the land across which the right-of-way will extend, will be filled in under the current dredging program.

New Ryan Plane, Consair Bomber Tested by Army

UNION 2-21-40

Army air corps officers yesterday started a series of tests on Consolidated's Aircraft Corp.'s new army four-motored bomber, XB-24, and Ryan's new type high-wing monoplane which has many of the characteristics of a helicopter.

With a wing span of 50 feet and equipped with a 425-horsepower motor, the Ryan plane can climb at an angle of 60 degrees, remain almost stationary in midair, and land with the ease and low speed of a helicopter.

Maj. K. B. Wolfe, head of the army trial board of 20 officers and technicians, which is conducting tests of the new bomber and the Ryan scout plane, has designated the Ryan craft as the YO-51.

The plane carries no armament and its primary function, according to Maj. Wolfe, is to take messages to military units operating behind the front lines and to coordinate infantry movements from the air.

The Ryan company is building three of these planes for the army air corps at a cost of $132,000.

The Consolidated bomber is receiving altitude tests preliminary to being flown next month to Dayton, O.

Army Will Test Consair Bomber

UNION 2-14-40

Eight army air corps officers from the office of the chief of army air corps at Washington, Wright field, Dayton, O., and March field, Riverside, arrived here yesterday to conduct a series of flight tests on Consolidated's new army bomber, the XB-24.

The officers are Majs. K. B. Wolfe, Stanley Umstead, E. M. Powers, A. W. Martinstein, Richard C. Coupland and Capts. D. L. Putt, E. J. Timberlake and H. A. Moore. They will remain here two weeks. After the tests, it is reported the bomber will be flown to Wright field.

The bomber, said to be the largest and fastest ship of its type, is of all-metal contruction. It is powered with four 18-cylinder radial air-cooled Pratt & Whitney engines

(Continued on Page 3-A, Col. 4)

totaling 4800 horsepower, giving the plane a cruising speed of 300 miles an hour and a cruising range, when carrying four tons of explosives, exceeding 3000 miles.

Equipped for wartime flying, the bomber weighs 25 tons and carries a crew of nine including two gunners. The plane has a wing spread of 110 feet, the length of the hull is 64 feet and the top of the pilot compartment is 19 feet from the ground. The four propellers are 12 feet in diameter.

The metal hull is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of tricycle type with a single wheel forward to prevent the bomber from ground looping. The rear wheels retract into the wing wells similar to those of an amphibian.

The bomber has been under construction more than a year at Consolidated under secret orders from the war department.

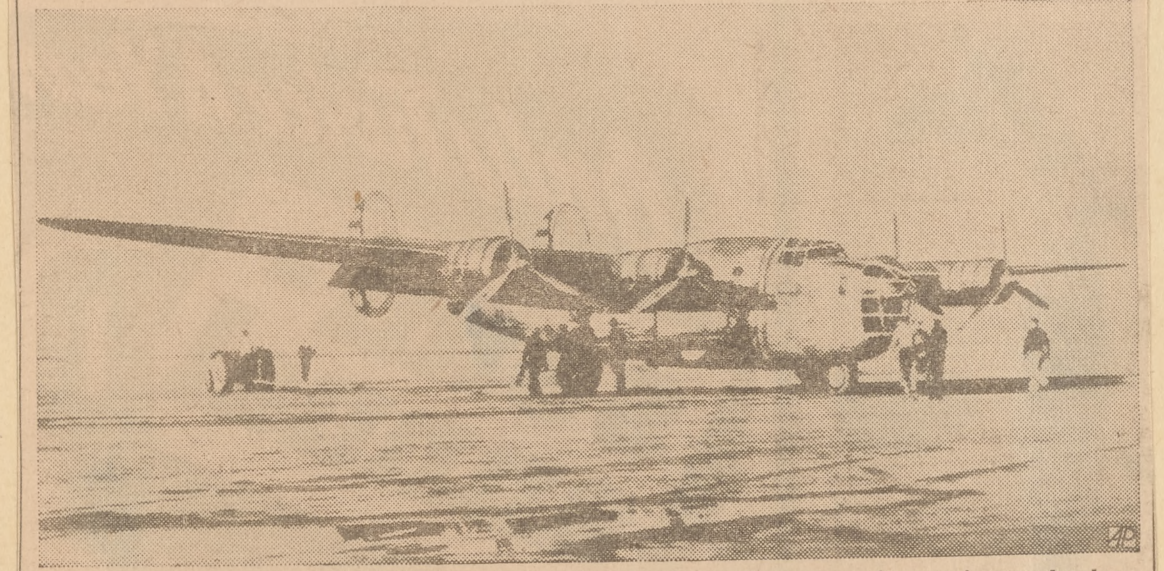
MORE NEW WINGS FOR UNCLE SAM



This picture, just released by the war department, shows the army air corps' new bomber, the XB-24, at San Diego, Calif. Built by the Consolidated Aircraft corporation, it is an all-metal, four-motored, high-wing plane, with a wing span of 110 feet, a 64-foot fuselage and height of 19 feet. Its speed is over 300 miles an hour, range 3000 miles, bomb-load capacity four tons. (Associated Press Wirephoto.)

Army Will Open Bids Soon For 186 Planes

Consair in Line For Contract on 42 Big Bombers

UNION 2-14-40

Bids for 186 planes, including 42 huge four-motored bombers which will cost $250,000 each and 144 scout planes, will be called for by the war department within a few weeks, United Press reported yesterday from Washington.

The army has options with the Consolidated Aircraft Corp., San Diego, and Boeing Co., Seattle, for construction of the four-motored bombers with the probability that Consolidated, designer and builder of the bomber, would receive the contract.

1450 CRAFT BUILT

A survey of the aircraft industry showed the nation is engaged in the greatest mass production era in its history as a result of huge foreign orders for wartime needs and the domestic demand for a vastly expanded national defense program.

Authoritative sources said that aviation plants, working at capacity, have filled foreign and domestic orders for 1450 combat planes and still must complete 7700 for the army, navy and foreign purchasers.

Foreign orders, principally British and French, have totaled 5000 planes, 1100 of which have been delivered or are ready for transportation overseas.

350 DELIVERED

The army and navy have placed orders for 4450 planes, only 350 of which, all for the army, have been delivered.

The growing importance of American aircraft in foreign defense programs is shown in a compilation of export licenses prepared by the joint army and navy clearance

(Continued on Page B, Col. 8)

Army Will Open Bids on Planes

(Continued from Page 1)

as to speed, armor and guns as ships now being built abroad.

President Roosevelt told his press conference he hoped the battleship funds would be restored. Meanwhile, he signed a deficiency bill providing $252,340,776 for defense and neutrality functions of the navy, army, coast guard and federal bureau of investigation in the current fiscal year.

19 NEW SHIPS, 352 PLANES

Presenting the drastically curtailed bill to the house as a "by-product of the unrest in international affairs" and not "a product of militarism," Chairman Scrugham (D-Nev) of the naval appropriations subcommittee declared that because this country owns or controls almost half the world's raw materials, it "cannot avoid the issue."

Chairman Vinson (D-Ga) of the naval committee expressed belief the cuts would not impede the ship building program, but he scheduled an executive session of his committee for tomorrow to analyze the bill before deciding whether to oppose any of the reductions.

The bill would provide funds to start work on 19 new combat ships and five auxiliaries; to purchase 352 new planes and to continue work on 79 warships and 18 auxiliary vessels already under construction.

GUAM FIGHT BEGINS ANEW

Its cuts gave the economy drive one of its strongest boosts. Tentative reductions in measures already passed by the house and senate or pending in the senate or its appropriations committee total about $150,000,000. The house committee cut the farm bill approximately $129,000,000 originally, but restorations left a net reduction of about $66,000,000 below budget estimates.

In addition to the $111,699,699 reduction in direct appropriations sought for the navy, the committee lopped $16,316,250 from so-called contract authorizations under which the navy could order work done and get appropriations later.

Echoes of last year's furious controversy over the navy's proposal to make Guam a Pacific outpost were heard almost immediately after debate opened.

1500 MILES FROM TOKYO

The appropriations committee recommended the harbor dredging and breakwater construction as essential to the safe landing of trans-Pacific commercial planes at the island, described as the only port open to American planes in the 3000 miles between Midway and Wake islands and the Philippines.

Rep. Thomason (D-Tex) protested against extension of naval facilities so far to the east—less than 1500 miles from Tokyo—and contended it would lead to fortification of Guam. Rep. Crawford (R-Mich), who fought the Guam project last year, told the house he was inclined to support the pending proposal.

In defense of the project, Rep. Maas (R-Minn) said he did not think Japan would "get mad" if this country removed some coral beds from the Guam harbor. He added that he knew of no better way of increasing Japan's respect for the United States than by letting her know "we'll do as we damn please."

'FLIGHT OF BUMBLE BEE' IS SEEN

New S. D. 'Rooster Plane' Hovers Over Field

By HAROLD KEEN

TRIB 2-20-40

The crowd at Lindbergh Field yesterday came to marvel at the mighty Consolidated XB-24 in its final company flight tests and stayed to chuckle at the Ryan YO-51 "bantam rooster," sensational new observation plane.

After the four-motored sky juggernaut roared to a majestic landing, Bob Kerlinger "trotted" Ryan's latest, secretly developed product out on the same runway, gunned the 420 horse power Pratt-Whitney Wasp engine and, if spectators blinked just once, they probably missed the take-off. Nothing like it ever has been seen in San Diego—or anywhere in the nation.

The YO-51 left the field like a frightened chicken, charged almost straight up in the air, and at a respectable height, hovered virtually motionless. Maj. K. B. Wolfe, head of the army air corps test board, smiled and commented:

"There's the heavier-than-air competition to the autogiro."

Anyone who has seen an autogiro in action could appreciate the unique performance of the marvelous new plane. Hardly more

(Continued on Next Page, Col. 2)

Witness S. D. Flight Of 'Rooster Plane'

CONTINUED FROM PAGE ONE

than 50 feet was required for the takeoff of the high-winged, slender fuselaged monoplane. The nose was pointed at an alarmingly steep angle, all of 60 degrees, perhaps more.

Wolfe explained that it is virtually a "flying motorcycle," to be used behind the lines in infantry liaison as a courier delivering messages or coordinating troop movements.

It is not intended to carry defensive armament, a single gun reducing its primary observation characteristics. Hence, the Ryan YO-51 probably never will be employed behind the enemy lines.

In wartime, where landing fields are likely to be cramped, the YO-51 will be able to take off and land in an amazingly restricted area. The ship came down at an angle almost as precipitous as on the takeoff, and almost stood stock still once the wheels touched ground.

Partly responsible for this performance is the tremendous area of the 50-foot wing. The Fowler-type flaps are so broad that they represent, in essence, a "retractable wing."

The YO-51, it was pointed out, has all the advantages of the autogiro, with none of the drawbacks, such as low speed. If necessary, the plane can streak away at high velocity. Ryan has a $132,000 order for three of these craft, now being given the official army once over.

Start Tests Today For New Army Bombers

TRIB 2-20-40

Tests by the army air corps of Consolidated's new four-motored army bomber were started today. The plane took to the air at Lindbergh field late yesterday for a 45-minute flight, piloted by William B. Wheatley, chief test pilot for Consolidated. Maj. Stanley Umstead, army pilot, is conducting the army's tests here.

The big plane was seen over San Diego again in mid-morning. The army flight tests are expected to last several days.

INDUSTRY STARTED IN NORTH ISLAND BARN

★ ★ ★ ★ ★ ★ ★ ★ ★

Aircraft Manufacture Now Second Largest Payroll Source Here

By RUTH TAUNTON

In 1910, Glenn Curtiss rented an old barn on North island, cut a runway through the brush so that his 40 horsepower biplane, held together with baling wire, could take off. These preparations completed, the birdman hung up a home-made sign.

That was the beginning of the aviation industry in San Diego that in 30 years has grown into the second largest payroll in the community. So swiftly has come the change since the Curtiss plane amazed the natives by remaining in the air over San Diego bay for 20 minutes, that few San Diegans realize that 11 percent of the population now is supported by aviation.

PAYROLL 1½ MILLION

But although 22,230 San Diegans are benefited by a monthly payroll in the aviation industry, including the navy, of $1,500,000, we still have no reason for smiling at the days when Curtiss ran out of his barn-hangar and held up a handkerchief to see which way the wind was blowing. Aviation's earliest beginnings in San Diego never were unimportant. It was at Curtiss Training school that Charles Witmer learned to fly—and it was Witmer who was called to St. Petersburg to train Russia's first air corps. And it was on North island that Glenn H. Martin tested in 1913 the first plane he ever sold to the U. S. army for military purpose.

In 1940 the aviation industry in San Diego has two phases: The number of people to whom it gives employment, with the large payroll released here as a stimulation to all other lines of business; and the great diversity of the industry.

Aviation in this community is only half-told when you think of the navy and Consolidated Aircraft Corp., tremendously important as they are. Speer Flying Service, for instance, is doing more flying than any other non-military school in the country with one exception, according to a recent survey.

So highly regarded is the flying school headed by W. Arnet Speer on Barnett ave. that so far, it is the only one in the country to receive two contracts under the new civil aeronautics authority, which is financing the training of 10,000 civilian men and women pilots each year on the theory that these young persons will continue to fly and advance aviation in the United States. Thirty students at State college, including two girls, are CAA students, and 20 from San Diego Junior college are being trained as pilots.

The CAA program is open only to college students, but at Speer's there also are more women student pilots than ever enrolled at one time in any U. S. flying school, according to information available here. Many of these women are clerks and stenographers with small incomes, as is the case with many men students.

'LITTLE MAN' FLIES MOST

"Contrary to popular belief," said Speer, "the bulk of private flying in this country is done by men and women earning $30 a week or less. This income-group buys 75 percent of the private flying time and instruction."

Ryan School of Aeronautics has been selected by experts in Washington as one of the finest aviation schools in the world, and is one of nine with contracts for primary training of army air corps cadets. In the last seven months Ryan has trained 180 cadets, who flew 9000 hours, or 1,000,000 miles—most of it over San Diego. But T. Claude Ryan also has built up a background of pioneering tradition in aircraft manufacture.

With 900 employes and a monthly payroll of $100,000, Ryan not only trains army cadets and manufactures military and commercial planes, but he operates the oldest government approved flight and ground school in the country. And it was this company that built Lindbergh's "Spirit of St. Louis." More recently, it was the Ryan S-T which became the first low-wing primary training plane to satisfy the army air corps sufficiently to make it break away from a 30-year precedent of biplanes for primary flight instruction. These San Diego-made trainers also have gone to China, Mexico, Central and South American countries, Australia and South Africa.

FIELD TOTALS 400 ACRES

Although Ryan has on his hands this spring the training of 210 students now at the school, plus the regular manufacturing and instruction courses of his plant, he has been civic-minded enough to add a special 5-week course in sheet metal to help San Diegans fill the need for 3000 trained men in other local plants. At this "West Point of the Air" on Lindbergh field there are

(Continued on Page 8, Col. 2)

(See next page)

1910 VENTURE START OF HUGE PLANE INDUSTRY

this week 72 army cadets taking flight training.

Lindbergh field is an aviation saga in itself. In 1927 San Diegans voted $650,000 in bonds to build it. Today the industrial payroll on it is $650,000 a month. The work projects administration has spent $1,500,000 on the field. When the first airmail service was established there in 1930, the airport had 75 acres. There are 400 acres now, and when completed will have more than 1000. It is said to be the only municipal airport in the country whose cost of operation does not exceed its income.

It is the southwest terminal for the Western Air Express and United Air Lines. Planes that carry from 10 to 21 passengers arrive at 7 and 11:10 a.m., 5:15 and 8:15 p.m.; leave at 7:45 and 11:25 a.m., 5:35 and 9 p.m. Although it took from two days to a week, depending on the weather, to come from San Francisco to San Diego in the days when George W. Marston first made the trip on the old steamer Orizaba, passenger planes leaving Lindbergh field arrive in San Francisco today in three hours flying time.

SAFE RECORD CITED

United and Western have made 29,200 flights between the local field and Los Angeles—equal to 233 flights around the world—with never an injury to a passenger. They brought in and took out of Lindbergh field last year 11,000 passengers, and carried 80,420 pounds of airmail for San Diegans, along with 4300 pieces of express that included 50 pounds of carrots from Imperial valley to a New York display. Among passengers arriving at the terminal were one 91 years old and an eight-week-old baby.

Also at Lindbergh field, or adjoining, are Solar Aircraft Co.; Army Air Corps Reserve; Airtech Flying Service, and the big plant of Consolidated.

Solar, established in 1927 and headed by Edmund T. Price, manufactures exhaust manifolds—will have manufactured 10,000 of them by June. It has 464 men on an annual payroll of $750,000. The army air corps reserve has two hangars on the field; and there Airtech Flying Service has its storage and service garages—the first buildings, in fact, on Lindbergh field Headed by Douglas T. Kelly, the company stores and services private planes, an average of about 20 San Diegans leaving their planes at the garage every night.

The army air corps reserve here includes 52 San Diegans and one resident of Calexico who are reserve officers, permitted to use the six army planes in the corps hangars for a maximum of 100 hours a year in the air. William Van Dusen, San Diego board of air control president, is one of the veterans in this group; and Judge Clarence Terry is among the candidates who soon will be petitioning for a commission. Capt. Walter W. Gross is in command of the corps, with Lt. H. B. Duckworth as his assistant instructor. He also has 16 regular army men as mechanics and office force on Lindbergh field.

COAST GUARD ACTIVE

At the coast guard air station, involved in so much rescue romance, there now is one pilot, Lt. C. G. Bowman, with his plane. Other planes formerly in the large hangar which was completed in April, 1937, have been flown to the Atlantic coast to do neutrality patrol duty. The coast guard has maintained plane service at Lindbergh field since 1934, with most of the calls for rescue coming in the summer when fishing vessels go south, and swimmers venture too far beyond the breakers.

Consolidated covers an area, in leases and options, of more than

(Continued from Page 1)

60 acres at Lindbergh field. One of the best integrated plane manufacturing plants in the United States, it received as a Christmas surprise the largest single order for planes ever placed by the U. S. government, increasing the company's backlog to over $40,000,000 and raising employment to 4200, with the expectation that 7500 will be employed by summer. The Dec. 20 contract awarded Consolidated by the navy department was for $20,016.699 in plane construction.

BUILDINGS 5 YEARS OLD

The original factory buildings of the corporation are only five years old; and the large experimental buildings, laboratories and storage rooms were built just three years ago. Prior to the present expansion program, Consolidated had 24 acres under lease at the municipal airport. Headed by Maj. Rueben H. Fleet, the corporation has sent model flying boats on routine flights to Pearl Harbor, Coco Solo, New York, the Polar area, Miami, New Guinea, Australia, Indian ocean, Africa, England, Europe and the Philippines. More than any other plant, in any other local industry, Consolidated is at present the great hope of the community in getting jobless young men to work as fast as they can be trained in vocational schools.

Marine corps aviation began on North island in 1924, when an observation squadron, with all hands and material, was transferred here upon evacuation of Santo Domingo. Marine aviation here has grown steadily ever since; and now the second marine aircraft group, fleet marine force, consists of four operating squadrons—fighting, scouting, bombing and utility. In addition, the headquarters and service squadron handles the administration, while the base air detachment carries out routine engineering details. Lt. Col. L. E. Woods, U.S.M.C., is in command.

LARGEST NAVY AIR BASE

As for the navy—few San Diegans outside of the service realize that all of the west coast fleet air activities are based on San Diego, and that San Diego's naval air bases include the majority of the land-based activities of the navy on the west coast.

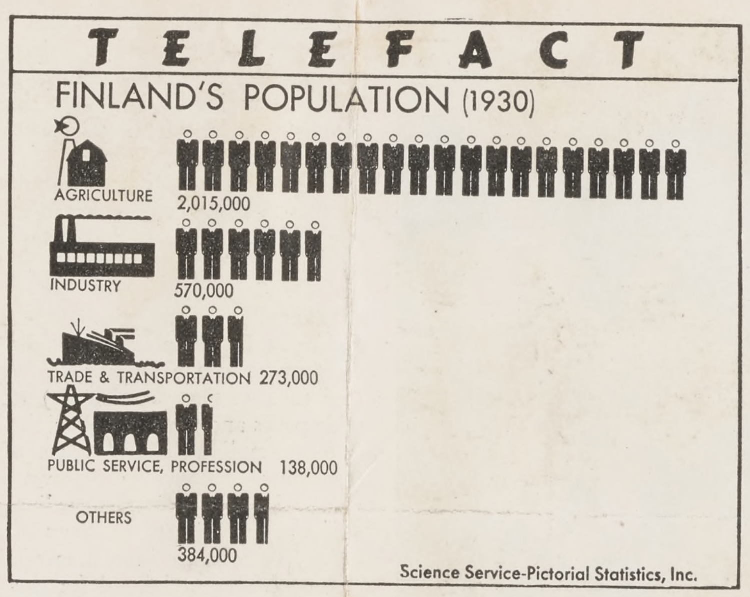
To understand the tremendous scope of naval air operations at San Diego, one must bear in mind that there are two distinct naval aircraft activities in this area: Forces attached to the fleet, and forces operating from shore establishments. Aircraft activities under the jurisdiction of the naval commandant at San Diego include the naval air station at San Pedro, under Comdr. J. C. Monfort, and the naval reserve aviation base, Long Beach, under Comdr. T. A. Gray, as well as naval air station here, commanded by Capt. J. S. McCain, and the second marine aircraft group, fleet marine force. The naval battle force aircraft is based here under command of Vice Adm. C. A. Blakely. Constant fleet movements preclude any accurate figures to total personnel, but an estimate is 3390 officers and men on North island. In addition there are more than 3000 officers, enlisted men and civil service employes attached to naval air station, with a payroll of $15,000 a day in the latter group.

CARRIERS ATTACHED HERE

The aviation groups of the aircraft carriers Lexington, Saratoga, Enterprise and Yorktown are based at North Island, with 300 planes attached to the four carriers.

The naval air station was established here in 1917, a result of the World war. Aside from the main activities on North island, the navy also has landing fields at Del Mar, Miramar, Camp Kearny, Rosedale, Ream, Border (near Imperial Beach), Otay, Jacumba, Ocotillo, Borego and Clark Dry Lake. Other airports in the county, aside from the bee-hive Lindbergh field, include commercial fields at Peik, Hall, Madsen, Chula Vista, Speer, and Linda Vista; the CAA field at Oceanside; private fields at Grande Vista, Gibbs, Ryan. In fact, a fine cross-word puzzle for this evening would be to mark on a map of the county the landing fields not listed here, as well as those that are!

Aside from these chief aviation activities in San Diego there are many more—glider clubs, model airplane clubs, San Diego Sheriff's Aero squadron, and San Diego Flying club, founded in 1935. The Flying club has three planes, which the 60 members not only pilot, but keep in tip-top shape all the time. Altogether, San Diego is one of the most air-minded spots on earth and, unlike Asia and Europe, has no unhappy memories. If Glenn Curtiss started it, all of San Diego in one way or another seems destined to carry on.



AERONAUTICS—ENGINEERING

Retractable Wing Pontoons For Giant Flying Boats

Patents Are Also Granted on Improved Machine Gun, Radio Beacons, Alloys, Warm Sheets, Vulcanized Carpet

HIGHER flying speeds and greater flying range are promised by a new method of retracting the huge wing pontoons of great seaplanes into the wings, described in Patent No. 2,187,040 granted by the U. S. Patent Office to I. M. Laddon, W. A. Ring and H. I. Mandolf of San Diego, Calif., and assigned to the Consolidated Aircraft Corporation. The patent shows how the landing pontoons fold up beneath the wing tips, become part of the airfoil section and decrease air resistance greatly.

An improved type of machine gun which is claimed to provide more accurate firing is described in patent No. 2,186,969 of Samuel G. Green of Gray, Ga. The invention times the firing position of the gun so that it comes always at the proper period of the recoil and counter recoil cycle. According to the patent, other machine guns fire when the breech block is near the closed position regardless of the position of the gun in its recoil cycle.

A new kind of vulcanized, sponge rubber carpet is the invention of H. P. Faris, Philadelphia, and D. W. Yochum and R. B. Logan of Trenton, N. J., granted patent No. 2,187,140. The carpet fabric is cemented onto a base of soft rubber which is simultaneously vulcanized and blown with air to form a sponge rubber base.

Two new types of radio beacon systems were among the patents of the week, No. 2,187,097 to Francis Pope of Glendale, Calif., improves the present quadrant signals which are now used extensively in aviation to mark airports. Signals A and N are sent in code by this device. They blend into an "on course" signal in the pilot's earphones.

The new invention overcomes a prior trouble of these systems; that the pilot —when receiving the on course signal, could not tell by the signal alone along which line he was approaching.

Another new radio beacon is that of Ernst Gerhard of Berlin (No. 2,187,618) which employs a parabolic type of reflector to project—in searchlight fashion —two nearly parallel short wave radio signals into space. As these signals diverge, a line of equal intensity is provided which can be used to mark a given position or a line of descent for an airplane.

From Germany also came patent No. 2,187,094 granted to J. Pink of Wiesswasser in Lausitz for an improved means of spinning glass filaments and fibers from molten glass.

Two new metal alloys received patents. No. 2,187,379 went to F. R. Hensel and K. L. Emmert of Indianapolis, Ind., for a new silver base alloy of high tensile strength that is useful for electrical make-and-break contacts and switches.

Charles J. Schafer of Baltimore, Md., was awarded patent No. 2,187,630 for a superior quality alloy metal for machine cutting tools. Among the elements used in the alloy are iron, zirconium, molybdenum, yttrium and combined columbium-tantalum.

For sleepers who dread cold sheets on a chilly night is patent No. 2,186,965 of Annette Fridolph, New York City, for a sheet woven in two ways. The middle part is the standard weave with its relatively smooth, cold feel, while the ends are woven with a napped surface forming a relatively soft, warmer surface.

To the well-known facsimile expert W. G. H. Finch, Spuyten Duyvil, N. Y., was awarded patent No. 2,187,374 for an improved method of transmitting colored and black-white pictures over telegraph lines.

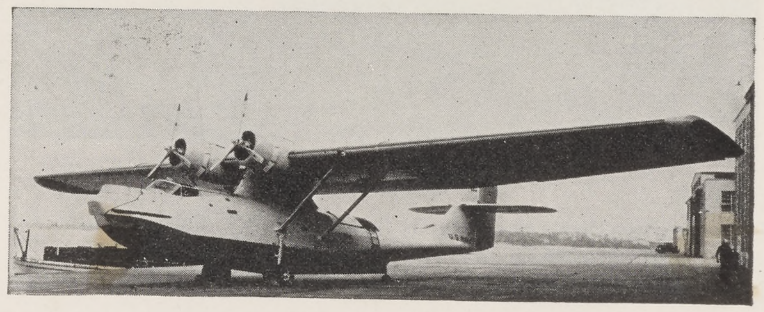
Consolidated 28 Amphibian

CONSOLIDATED'S Model 28 Amphibion has two P & W Twin Wasps delivering 2,100 hp total at 7,800 ft. High speed, 199 mph. at 7,800 ft.; cruising, 179 mph. at 7,800 ft.

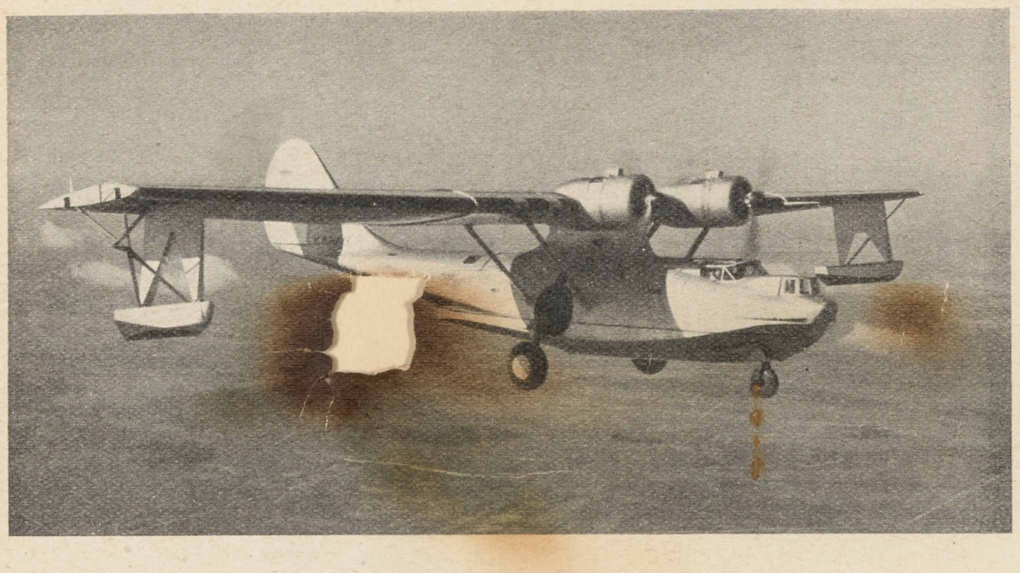
AVIATION FEB. 1940

Consolidated 28

CONSOLIDATED'S Model 28 twin-engined flying boat features a wide scope of possible operations, 9-man crew space, machine gun and bombing equipment.



AVIATION FEB. 1940



THE BIGGEST AMPHIBIAN.—The new Consolidated Model 28-5A amphibian (two 1,200 h.p. Pratt and Whitney Hornets) based on the well-tried PBY boats supplied to the U.S. Navy. The photograph shows the amphibian with the retractable wheels and floats extended.

The Consolidated Amphibian

AN AEROPLANE, to be useful in every possible sphere of operation, must be an amphibian. Obviously something must be paid for the advantage of being able to take off from or alight on land and water. Up till now the disadvantages in extra weight and decreased performance have been held to outweigh the advantages to be gained. Economic operation is achieved all too hardly, anyway. Only in an exceptional aeroplane are the advantages worth while.

Now at last an amphibian gear has been applied to an exceptional aeroplane—the Consolidated Model 28—which, designated the PBY by the U.S. Navy, has achieved many fine flights over long distances in formation. An aeroplane of this type was flown non-stop across the Atlantic last Summer from Botwood to Felixstowe, 2,450 miles in 15½ hrs., and another, the Guba, was flown round the World, stopping in New Guinea on the way to do useful work.

The new amphibian version of the Consolidated boat, the Model 28-5A, was built for the U.S. Navy as the XPBY-5A. Makers' trials are complete and the boat has been delivered to the U.S. Navy for trials at Anacostia. The chief modification is the incorporation of a retractable tricycle landing gear. The nose wheel is retracted backwards into the bottom of the hull and enclosed by flush-fitting hatches—the side wheels with their oleo shock-struts retract into wells in the side of the hull. All the three wheels are operated by hydraulics from a central power unit. A single lever controls extension and retraction.

The flying characteristics of the boat have been found to be unaffected by the landing gear. It has been flown with this gear in all positions and with the retractable wing-tip floats up and down, without any adverse effects. When the gear is retracted the top speed of more than 200 m.p.h. at 12,300 ft. remains unaffected.

We have heard no figures for the increased weight, but the reduction of payload must be of the order of at least 1,000 lb. Normally the Consolidated boat has a payload of 4,000 lb. for 2,700 miles at 160 m.p.h. on 57% rated power.

The makers claim for the landing gear that apart from the obvious advantage of making possible operation from land aerodromes, it is a great advantage for taxying in rough water. The extended gear serves as a sea anchor and assists control, and the approach to a mooring or ramp in a difficult wind is made easier. More power can be taken from the motors for turns of small radius without gaining too great acceleration and with less skidding. The danger of scraping the keel on a ramp is eliminated. Beaching is simple and no extra crew is needed. The machine can be operated from remote sandy beaches without any special ramp and this is of very great use when the boat may be flown on active service. The boat can run out of the water under its own power and in going down a ramp is completely controlled by its wheel-brakes.

All these advantages are not confined to the Consolidated amphibian and naturally apply equally to our own small Vickers-Supermarine Walrus which has been in operation with the Fleet Air Arm for many years.

An advantage so far peculiar to the Consolidated boat is its tricycle gear, which naturally has all the points which make tricycle undercarriages popular with pilots. The brakes can be put full on when landing with no adverse effects.

Two other features are worthy of note. There is automatic draining of the hatch of the nose wheel before the machine takes off from the water, so that the trim is unaffected. The machine retains the usual lugs for the beaching gear. Thus when the tricycle undercarriage requires servicing, the standard beach gear is attached and the boat runs out of the water. The landing wheels are carried clear of the ground.

Details of the operation of the Consolidated amphibian will be interesting when forthcoming. By virtue of its range and impartiality to land or sea alightings, it could be operated from anywhere to anywhere in the World.

The interests of the Consolidated Corporation are handled in this country by Aviation Corporates Ltd., of 55, Pall Mall, London, W.1. Recently there have been more unconfirmed rumours of British orders for these boats.

CONSOLIDATED

THE BRITISH BOAT. — The Consolidated Model 28-5 two-motor flying-boat supplied to the Royal Air Force for experiments. It was flown across the Atlantic non-stop from Botwood to Felixstowe. The photograph shows the machine on its beaching chassis. It is not an amphibian.

Bomber to Get Final Tests At March Field

UNION 2-26-40

For final tests before being flown to Wright field, Dayton, O., the army's latest and most powerful long-range bomber, XB-24, left Lindbergh field yesterday for March field, Riverside.

The huge Consolidated-built four-motored bomber carried a crew of eight, including Majs. K. B. Wolfe and Stanley Umstead, Capt. E. F. Harmon and five air corps technicians.

The XB-24 is to return here Wednesday and will remain a month while additional equipment is installed before taking off for Dayton.

The bomber has a speed of 300 miles an hour, a cruising range exceeding 3000 miles and carries in addition to a heavy armament of machine guns four tons of bombs. It weighs 20 tons loaded.

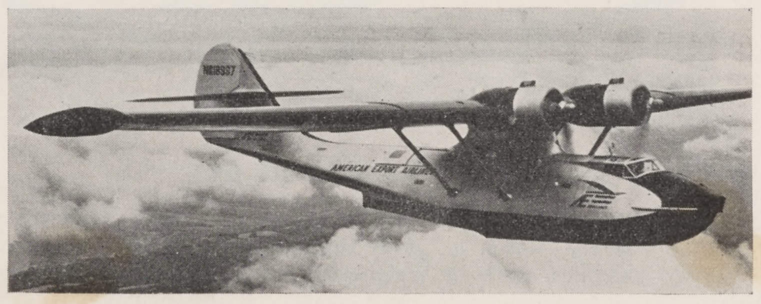
---

dent Ted Lynn. Largest single order was received from Lockheed for 200 additional sets of equipment and spare parts for use on the re-ordered Lockheed-Hudson bombers for England. Other unfilled orders are on hand from Boeing, Brewster, Consolidated, Naval Aircraft Factory, Sweden, Vought-Sikorsky and Vultee.

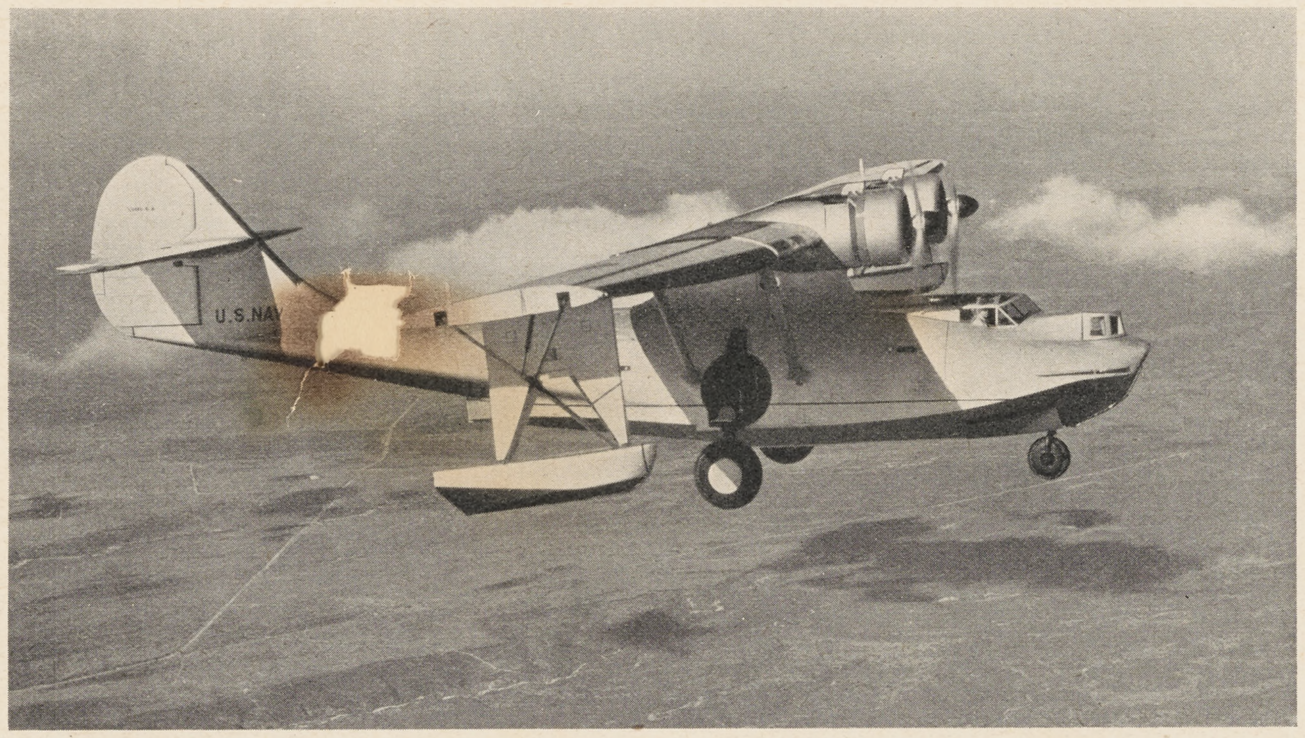
Consolidated 28 Flying Boat

No A.T.C.

CONSOLIDATED Model 28 is 20 passenger flying boat. Two P. & W. Twin Wasps, total 2100 h.p. Cruising speed, 179 m.p.h. at 7800 ft.; gross weight, 27,000 lb.



THE AEROPLANE 32 JANUARY 12, 1940



THE BIGGEST AMPHIBIAN.—A new Consolidated Model 28-5 flying-boat converted to a tricycle amphibian with rectractable wheels. It has been built for the U.S. Navy who have given it the number XPBY—5A. In this form the Consolidated boat is one of the most useful aeroplanes in the World because it can operate from land or sea bases and has a range sufficient to cross the Atlantic with a payload. The British agents are Aviation Corporates Ltd.

$22.71 AN HOUR FOR NAVY BOMBER ON NEUTRAL DUTY

WASHINGTON, Feb. 15 (A.P.)—Here's one for the motorist who thinks it's expensive to operate his auto. The operating cost of the navy bombers, now on neutrality patrol, has been $22.71 an hour—and it's going up.

This cost, Rear Adm. John H. Towers told the house appropriations committee, did not include overhaul and depreciation. The cost was rising, he said, because newer models require a higher quality gasoline than older ones.

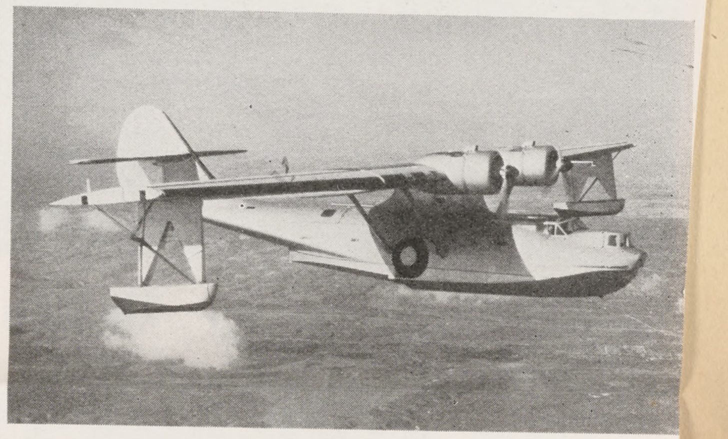
AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

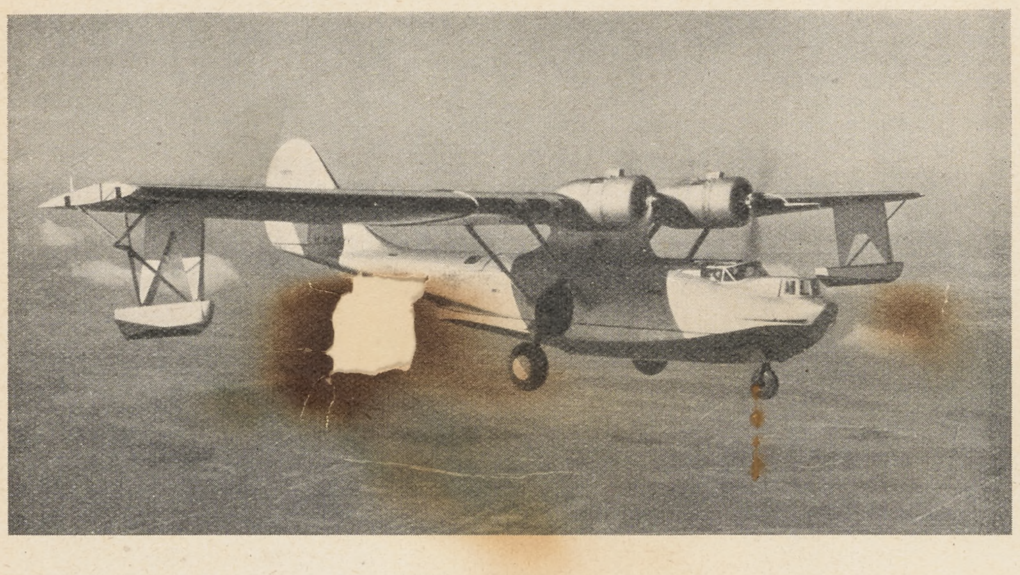
Whether the new patrol boats will incorporate the amphibian feature was not disclosed.



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consolidated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatic ally operated hatches so tha no resistance to planing is en countered. All three wheel are operated by a central hy draulic power drive, and th operations are carried out i sequence automatically. single lever controls both th extension and the retractio of the landing gear. Hydrauli pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.



THE BIGGEST AMPHIBIAN.—The new Consolidated Model 28-5A amphibian (two 1,200 h.p. Pratt and Whitney Hornets) based on the well-tried PBY boats supplied to the U.S. Navy. The photograph shows the amphibian with the retractable wheels and floats extended.

The Consolidated Amphibian

AN AEROPLANE, to be useful in every possible sphere of operation, must be an amphibian. Obviously something must be paid for the advantage of being able to take off from or alight on land and water. Up till now the disadvantages in extra weight and decreased performance have been held to outweigh the advantages to be gained. Economic operation is achieved all too hardly, anyway. Only in an exceptional aeroplane are the advantages worth while.

Now at last an amphibian gear has been applied to an exceptional aeroplane—the Consolidated Model 28—which, designated the PBY by the U.S. Navy, has achieved many fine flights over long distances in formation. An aeroplane of this type was flown non-stop across the Atlantic last Summer from Botwood to Felixstowe, 2,450 miles in 15½ hrs., and another, the Guba, was flown round the World, stopping in New Guinea on the way to do useful work.

The new amphibian version of the Consolidated boat, the Model 28-5A, was built for the U.S. Navy as the XPBY-5A. Makers' trials are complete and the boat has been delivered to the U.S. Navy for trials at Anacostia. The chief modification is the incorporation of a retractable tricycle landing gear. The nose wheel is retracted backwards into the bottom of the hull and enclosed by flush-fitting hatches—the side wheels with their oleo shock-struts retract into wells in the side of the hull. All the three wheels are operated by hydraulics from a central power unit. A single lever controls extension and retraction.

The flying characteristics of the boat have been found to be unaffected by the landing gear. It has been flown with this gear in all positions and with the retractable wing-tip floats up and down, without any adverse effects. When the gear is retracted the top speed of more than 200 m.p.h. at 12,300 ft. remains unaffected.

We have heard no figures for the increased weight, but the reduction of payload must be of the order of at least 1,000 lb. Normally the Consolidated boat has a payload of 4,000 lb. for 2,700 miles at 160 m.p.h. on 57% rated power.

The makers claim for the landing gear that apart from the obvious advantage of making possible operation from land aerodromes, it is a great advantage for taxying in rough water. The extended gear serves as a sea anchor and assists control, and the approach to a mooring or ramp in a difficult wind is made easier. More power can be taken from the motors for turns of small radius without gaining too great acceleration and with less skidding. The danger of scraping the keel on a ramp is eliminated. Beaching is simple and no extra crew is needed. The machine can be operated from remote sandy beaches without any special ramp and this is of very great use when the boat may be flown on active service. The boat can run out of the water under its own power and in going down a ramp is completely controlled by its wheel-brakes.

All these advantages are not confined to the Consolidated amphibian and naturally apply equally to our own small Vickers-Supermarine Walrus which has been in operation with the Fleet Air Arm for many years.

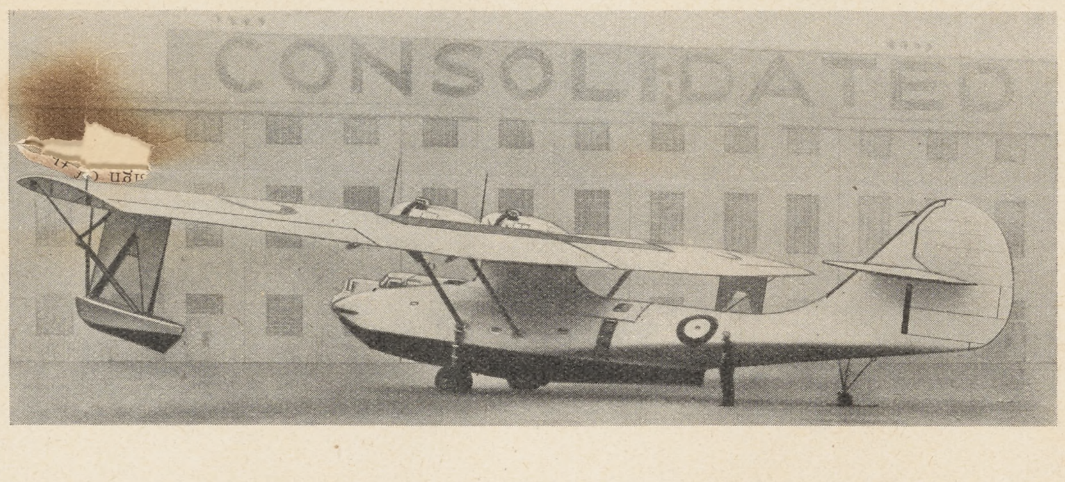
An advantage so far peculiar to the Consolidated boat is its tricycle gear, which naturally has all the points which make tricycle undercarriages popular with pilots. The brakes can be put full on when landing with no adverse effects.

Two other features are worthy of note. There is automatic draining of the hatch of the nose wheel before the machine takes off from the water, so that the trim is unaffected. The machine retains the usual lugs for the beaching gear. Thus when the tricycle undercarriage requires servicing, the standard beach gear is attached and the boat runs out of the water. The landing wheels are carried clear of the ground.

Details of the operation of the Consolidated amphibian will be interesting when forthcoming. By virtue of its range and impartiality to land or sea alightings, it could be operated from anywhere to anywhere in the World.

The interests of the Consolidated Corporation are handled in this country by Aviation Corporates Ltd., of 55, Pall Mall, London, W.1. Recently there have been more unconfirmed rumours of British orders for these boats.

THE BRITISH BOAT. — The Consolidated Model 28-5 two-motor flying-boat supplied to the Royal Air Force for experiments. It was flown across the Atlantic non-stop from Botwood to Felixstowe. The photograph shows the machine on its beaching chassis. It is not an amphibian.



Bomber to Get Final Tests At March Field

UNION 2-26-40

For final tests before being flown to Wright field, Dayton, O., the army's latest and most powerful long-range bomber, XB-24, left Lindbergh field yesterday for March field, Riverside.

The huge Consolidated-built four-motored bomber carried a crew of eight, including Majs. K. B. Wolfe and Stanley Umstead, Capt. E. F. Harmon and five air corps technicians.

The XB-24 is to return here Wednesday and will remain a month while additional equipment is installed before taking off for Dayton.

The bomber has a speed of 300 miles an hour, a cruising range exceeding 3000 miles and carries in addition to a heavy armament of machine guns four tons of bombs. It weighs 20 tons loaded.

Manufacturers Seeking Capital

By Raymond Hoadley

Mr. Hoadley would be happy to answer inquiries regarding the financial condition of the listed aviation companies.

As the rush begins to turn out the huge backlogs of foreign and domestic orders accumulated in the past four months, aircraft manufacturers, in increasing number, are looking to the capital markets for funds to finance plant and equipment expansion and to augment working capital. In addition to unfilled orders now approaching $700,000,000, many companies are negotiating with foreign governments for large orders for delivery in 1941 and in 1940 wherever capacity remains. A large number intend to double delivery rates in the next few months, a few hope to triple production by June. Obviously such an increase in production activity means large cash requirements this winter. Besides the recently announced new financing, it is reported in trade circles that Boeing, Brewster, Piper and possibly Consolidated may be seeking new equity money in the not distant future.

The transport companies will be big factors in the new capital markets in the next year. Another transition stage has arrived, similar to those of 1932 and 1936, when the re-equipment of lines was undertaken in wholesale manner to meet future traffic demands. New equipment, some of which has been under development since 1936, is, or shortly will be available to handle larger loads. The Air Traffic Conference predicts that 500,000 more passengers will be carried on domestic airlines in 1940 than were transported in 1938. Many new routes are likely to be established this year. Some $25,000,000 in new plane orders have been placed for 1940 delivery and bookings running to around $15,000,000 are scheduled for early 1941 shipment. New capital will be required to finance the bulk of this equipment and, if the markets are right, these funds will be secured largely through common stock flotations rather than equipment trust certificates, the time honored favorite method of the railroads.

$22.71 AN HOUR FOR NAVY BOMBER ON NEUTRAL DUTY

WASHINGTON, Feb. 15 (A.P.)—Here's one for the motorist who thinks it's expensive to operate his auto. The operating cost of the navy bombers, now on neutrality patrol, has been $22.71 an hour—and it's going up.

This cost, Rear Adm. John H. Towers told the house appropriations committee, did not include overhaul and depreciation. The cost was rising, he said, because newer models require a higher quality gasoline than older ones.

AMPHIBIAN FEATURE ADDED TO CONSOLIDATED PBY BOATS

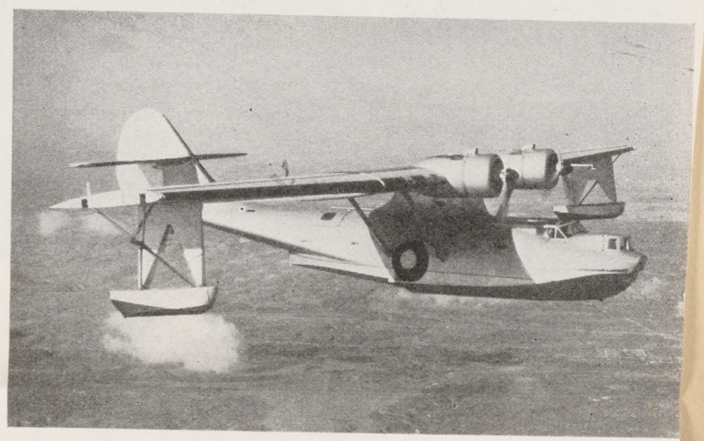
THE Consolidated Aircraft Corporation's new Model 28-5A amphibian, designed by the U. S. Navy for whom it was constructed as the XPBY-5A, has undergone its flight testing and is now in the Navy's hands at Anacostia.

Consolidated announced receipt of an order amounting to $20,016,699 for an undisclosed number of four-engined patrol bombers of the PBY series from the **U. S. Navy Department** on December 20.

Whether the new patrol boats will incorporate the amphibian feature was not disclosed.

dated amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY, now having incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added.

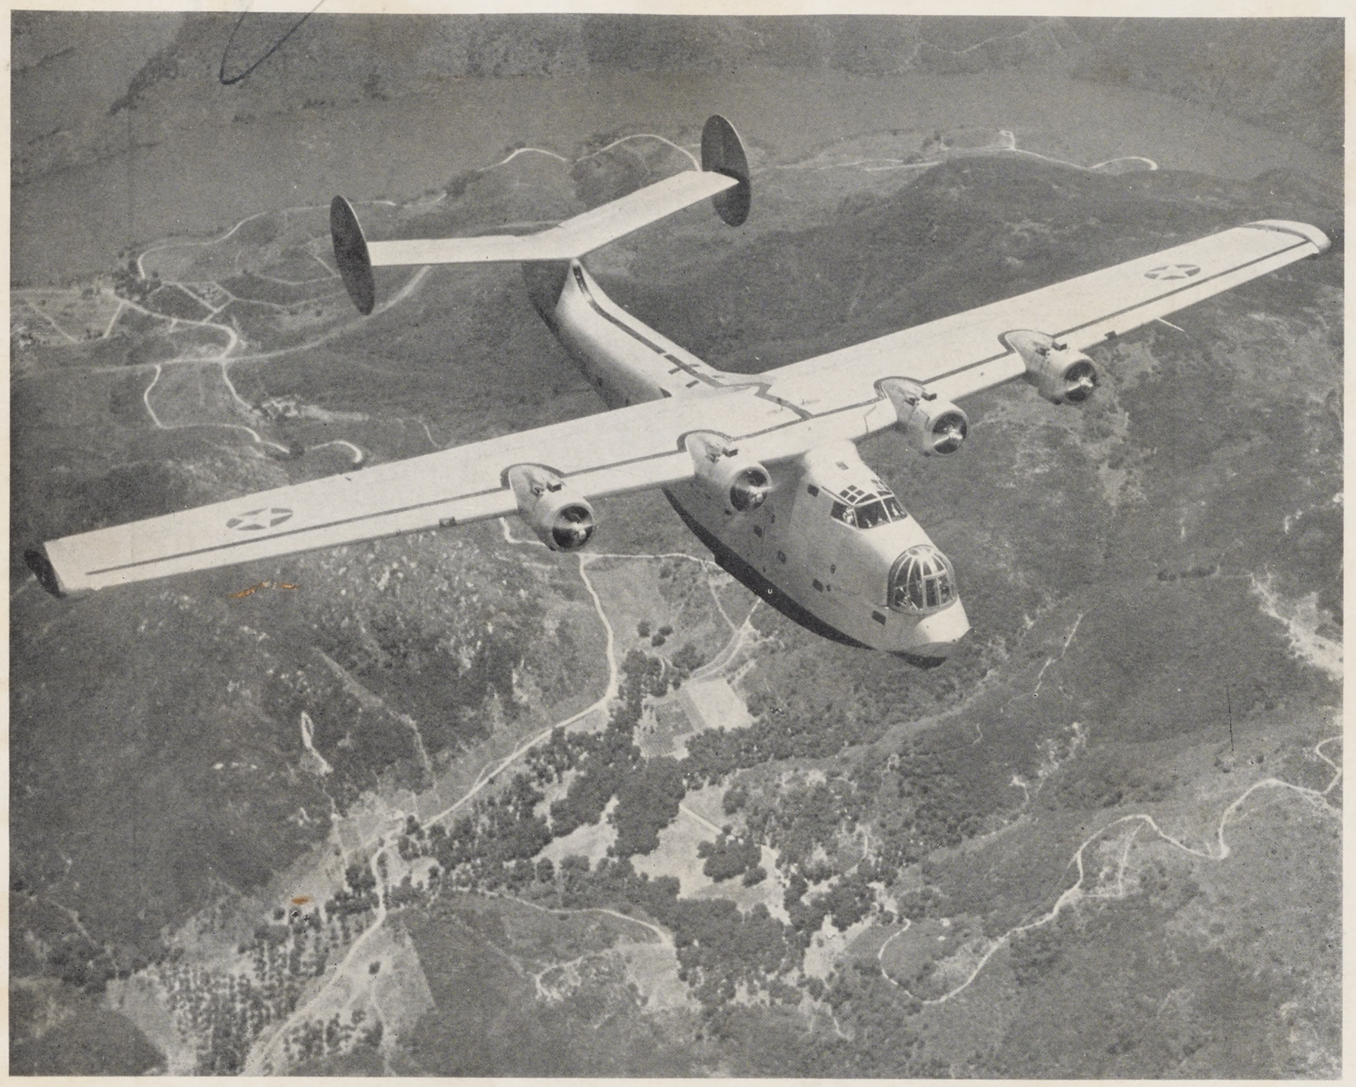
The landing gear is of the tricycle type, with a single wheel forward and two aft, all fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the re-



With the order, Consolidated's backlog of unfilled orders zoomed to more than $37,000,000. Reports from the factory said that this new contract will require increased manufacturing facilities and necessitate an expansion program which will cost between $1,500,000 and $2,000,000. The same report said that no outside financing will be required for the expansion, which will increase production facilities by 50 per cent.

Basically the new Consoli-

tracted position by automati ally operated hatches so tha no resistance to planing is en countered. All three wheel are operated by a central hy draulic power drive, and th operations are carried out i sequence automatically. A single lever controls both th extension and the retractio of the landing gear. Hydrauli pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.



XPB2Y-1

SEA POWER FEB. 1940

XPB2Y-1

SEA POWER FEB. '40

Our cover this issue is a picture of XPB2Y-1. On August 24th, 1939, this Consolidated Aircraft Corporation four engined flying boat became a Flagplane of the United States Navy. On that date, Admiral A. B. Cook, commanding the Aircraft Squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the U.S.S. MEMPHIS at Seattle, and hoisted it aboard the XPB2Y-1, thereby establishing another milestone in naval air history. Only a few times before had such a flag been officially hoisted over an airplane. The huge plane, by formal procedure, thus became a flagplane of the U. S. Navy . . . a signal honor. It had been flown to Seattle by Navy personnel commanded by Commander Andrew Crinkley.

Commander Crinkley and his crew, in October of 1938, flew the XPB2Y-1, while still fitted with experimental apparatus and equipment, on a precedent setting flight across the United States. The XPB2Y-1 is a flying boat, yet the flight was made entirely over land, demonstrating confidence in the smooth functioning of the ship. The flight was non-stop from the waters of San Diego Bay, northward over spectacular mountain terrain via Salt Lake City and thence due east to Anacostia (Washington, D. C.), where the airplane was inspected personally by President Roosevelt. Flight time was 13 hours. Very cold weather, darkness over much of the route, tailwinds and a closing in fog at Anacostia marked this outstanding transcontinental flight. The return to San Diego, a few days later, was likewise cross-continent, and non-stop, this time by a southern route and against headwinds of considerable magnitude which were met without difficulty.

The casual manner in which these flights were accomplished was expressed by Commander Crinkley soon after the ship's return: "This flight was made in all respects in a routine operation manner and no special consideration or preparation was necessary in its accomplishment. Upon our return to San Diego the crew felt confident that the ship could have been refueled to depart for Honolulu or any other point immediately."

This double spanning of the continent may, in retrospect, be seen as a striking potentiality, together with the recent honor of becoming an official Flagplane. . . . Such a performance could easily have been one for transporting the commanding officers and members of their staff, with lightning speed, to positions thousands of miles away, even though the Naval destinations might be separated by a whole continent. An official Flagplane thus appears to have in it latent usage of very wide nature. The recent flight of the XPB2Y-1 to Seattle, for instance, coincided with the arrival of Admiral A. B. Cook on the U.S.S. MEMPHIS en route to Sitka, Alaska; by using the XPB2Y-1, however, the Admiral had time for inspection in Seattle and for another inspection period in Sitka, before the MEMPHIS reached port.

As beaching gear had not been shipped in advance, or carried aboard, the Flagplane simply rode at anchor thus becoming a surface vessel, fully equipped as the Admiral's Headquarters. It was the first four engined plane to visit the harbor. Particularly excellent weather prevailed for the official Flagship's flights, and several of these, for observation purposes, were made to take full advantage of the opportunity afforded. One flight took the party over the Juneau, Cross Bay and Inland Passageway which allowed unsurpassed views of some five large glaciers in that region. With the disembarking of Admiral Cook for Kodiak with a patrol formation of Consolidated PBY airplanes, Commander Crinkley headed the huge plane back for San Diego, stopping enroute only at San Francisco. Elapsed time from Alaska to within ten miles of the Mexican Border was just 11 hours.

CURTISS ELECTRICS ON PATROL *with the* NAVY

The U. S. Navy, "First with Feathering" in 1934, when it equipped its Consolidated P2Y-3 Patrol Planes with Curtiss Electric Propellers, is again First in developing, with Curtiss engineers, the Reverse-pitch Propeller to provide its giant seaplanes with water-maneuverability hitherto unparalleled. Another degree of utility has thus been added to the outstanding four-engined Consolidated Patrol Bomber.

The adaptability of Curtiss Electrics has also led to their selection for the Navy's newest fast fighters in which air-maneuverability and high performance are paramount.

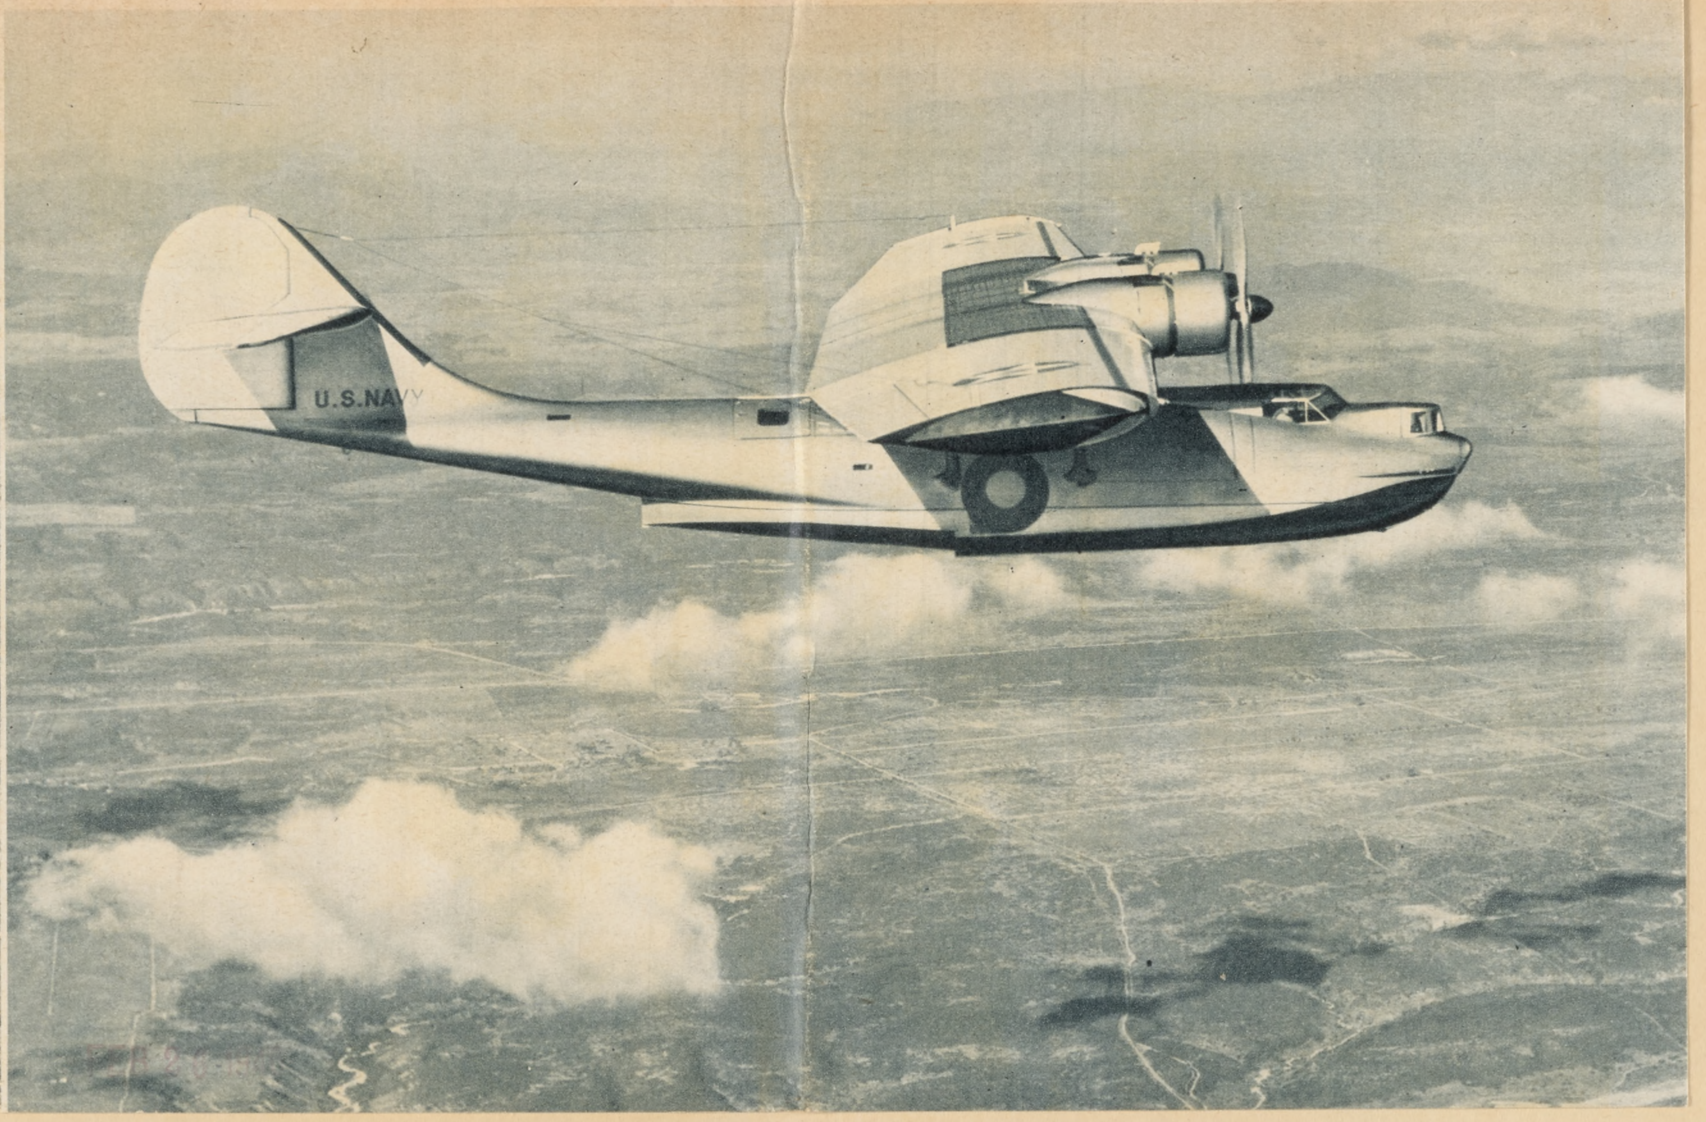
THE LOG FEB. 16, '40

Consolidated Amphibium Modell 28-5 A (Artikel Seite 17).

SWISS AERO-REVUE JAN. 1940



Consolidated Amphibium Modell 28-5 A.

(Bild auf Seite 11.)

SWISS AERO-REVUE JAN. 1940

Aus ihrem bekannten Modell 28, welches bei der U. S. Navy als « PBY Flugboot » bezeichnet wird, hat die Consolidated Aircraft Corporation in San Diego in Kalifornien vor einiger Zeit ein Amphibienflugzeug entwickelt, über welches soeben einige Einzelheiten bekanntgegeben wurden.

Das Flugboot, das bei der Firma Modell 28-5 A und bei der U. S. Navy « XPBY-5 A » heisst, ist das grösste bisher gebaute Amphibienflugzeug. Sonst in fast allen Einzelheiten dem Modell 28 gleichend, hat es ein Dreiradfahrgestell bekommen, bei dem alle drei Räder einziehbar sind. Das vordere Rad, das bei der Landung aus dem Bug herausragt, wird während des Fluges in den Rumpf zurückgezogen, wobei das etwa eingedrungene Seewasser erst vollständig auslaufen muss, ehe sich die Verschlussklappe dicht schliessen kann. Die beiden unter der Tragfläche liegenden Haupträder klappen sich nach oben und seitlich in für sie vorgesehene Vertiefungen ein.

Die bekannt guten Flugeigenschaften des Modells 28 sind durch diesen Zusatz in keiner Weise beeinträchtigt oder verändert worden. Es ist in jeder Hinsicht das gleiche Flugboot, nur dass es mit dem zusätzlichen Landegestell nun auch Landflugplätze anlaufen kann. Ausgedehnte Versuche haben ergeben, dass es gelegentlich auch von Vorteil ist, das Fahrgestell im Wasser auszustrecken. Die Räder haben dann die Wirkung von See-Ankern, d. h. sie erhöhen durch ihren Wasserwiderstand die Stabilität des Flugbootes. Das ist besonders beim Schwimmen auf grober See vorteilhaft, zwar wird die Schwimmgeschwindigkeit etwas herabgesetzt, aber ein ruhigeres Fahren gewährleistet.

Mit ausgestrecktem Fahrgestell kann das Flugboot auch einen flachen Strand aus eigener Kraft erklimmen, ohne auf eine besondere Landemannschaft angewiesen zu sein. Ebenfalls kann es vom Ufer aus sich aus eigener Kraft in das Wasser gleiten lassen, um dann von der Wasserfläche aus abzufliegen. Es ist natürlich sehr oft leichter, ein auf dem Strande festliegendes Flugboot mit Brennstoff zu beladen, als ein schwimmendes.

Willy Ley.

HALF-MINUTE Interviews
BY FORREST WARREN

S.D. Union Jan 7 1940

Mrs. F. T. Scripps: "The people of San Diego and its visitors certainly owe a thank-you to the Consolidated Aircraft for the beautiful and perfect Christmas tree with its hundreds of jeweled lights, making it the most glorious tree ever seen here. As I was driving by with my four-year-old granddaughter, she said, 'It is the most beautiful Christmas tree in the world; grandmother, please drive slow so I can see for a long time.' It is something to remember, and we both say, 'Thank you,' to Consolidated."

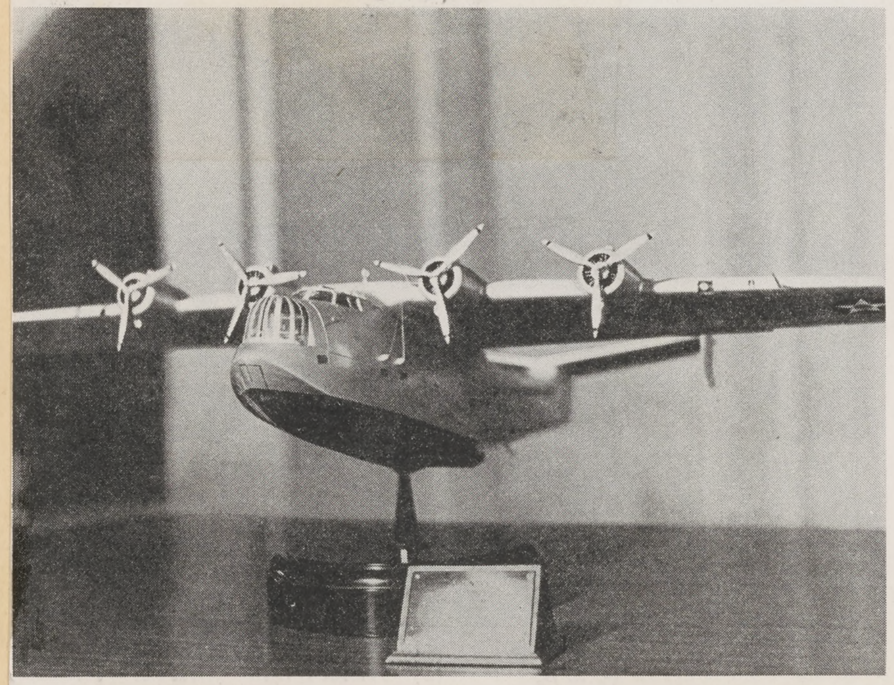
The Consolidated XPB2 Y-1 four engined flying boat of the Aircraft Scouting Force.

LOG FEB. 16, 1940

FEB. 16, 1940



XPB2Y Newest Navy 4 engine flying boat six of which are now on order for the Navy Department. It houses a complete bridge, galley, and chart room; and will carry a crew of ten or twelve—including a Captain, Navigator, and three Pilots—with all supplies required for about a week's cruise. Two models similar to these are made up for each new type of plane that the Navy Department considers; one of these will be made available to the Naval Academy immediately upon completion in every case.

Archbold Pilot Dies In New York, Word

TRIB 3/4/40

Lewis A. Yancey, 44, who piloted Richard Archbold's Consoliidated-built flying boat Guba around the world after a flight from San Diego to New Guinea for 10 months' scientific research there, died Saturday night at Yonkers, N. Y., The Associated Press reported. In 1929 Yancey flew from the United States to Italy with Roger Q. Williams, and later flew an autogiro to Cuba and Mexico.

Yancey was born Sept. 16, 1895. Surviving is his widow, the former Gertrude Civello. Funeral services are to be held tomorrow, and burial will be in Arlington national cemetery. Yancey was in the navy 13 years.

SEA POWER FEB. 1940

XPB2Y-1

SEA POWER FEB. '40

Our cover this issue is a picture of XPB2Y-1. On August 24th, 1939, this Consolidated Aircraft Corporation four engined flying boat became a Flagplane of the United States Navy. On that date, Admiral A. B. Cook, commanding the Aircraft Squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the U.S.S. MEMPHIS at Seattle, and hoisted it aboard the XPB2Y-1, thereby establishing another milestone in naval air history. Only a few times before had such a flag been officially hoisted over an airplane. The huge plane, by formal procedure, thus became a flagplane of the U. S. Navy . . . a signal honor. It had been flown to Seattle by Navy personnel commanded by Commander Andrew Crinkley.

Commander Crinkley and his crew, in October of 1938, flew the XPB2Y-1, while still fitted with experimental apparatus and equipment, on a precedent setting flight across the United States. The XPB2Y-1 is a flying boat, yet the flight was made entirely over land, demonstrating confidence in the smooth functioning of the ship. The flight was non-stop from the waters of San Diego Bay, northward over spectacular mountain terrain via Salt Lake City and thence due east to Anacostia (Washington, D. C.), where the airplane was inspected personally by President Roosevelt. Flight time was 13 hours. Very cold weather, darkness over much of the route, tailwinds and a closing in fog at Anacostia marked this outstanding transcontinental flight. The return to San Diego, a few days later, was likewise cross-continent, and non-stop, this time by a southern route and against headwinds of considerable magnitude which were met without difficulty.

The casual manner in which these flights were accomplished was expressed by Commander Crinkley soon after the ship's return: "This flight was made in all respects in a routine operation manner and no special consideration or preparation was necessary in its accomplishment. Upon our return to San Diego the crew felt confident that the ship could have been refueled to depart for Honolulu or any other point immediately."

This double spanning of the continent may, in retrospect, be seen as a striking potentiality, together with the recent honor of becoming an official Flagplane. . . . Such a performance could easily have been one for transporting the commanding officers and members of their staff, with lightning speed, to positions thousands of miles away, even though the Naval destinations might be separated by a whole continent. An official Flagplane thus appears to have in it latent usage of very wide nature. The recent flight of the XPB2Y-1 to Seattle, for instance, coincided with the arrival of Admiral A. B. Cook on the U.S.S. MEMPHIS en route to Sitka, Alaska; by using the XPB2Y-1, however, the Admiral had time for inspection in Seattle and for another inspection period in Sitka, before the MEMPHIS reached port.

As beaching gear had not been shipped in advance, or carried aboard, the Flagplane simply rode at anchor thus becoming a surface vessel, fully equipped as the Admiral's Headquarters. It was the first four engined plane to visit the harbor. Particularly excellent weather prevailed for the official Flagship's flights, and several of these, for observation purposes, were made to take full advantage of the opportunity afforded. One flight took the party over the Juneau, Cross Bay and Inland Passageway which allowed unsurpassed views of some five large glaciers in that region. With the disembarking of Admiral Cook for Kodiak with a patrol formation of Consolidated PBY airplanes, Commander Crinkley headed the huge plane back for San Diego, stopping enroute only at San Francisco. Elapsed time from Alaska to within ten miles of the Mexican Border was just 11 hours.

CURTISS ELECTRICS ON PATROL *with the* NAVY

The U. S. Navy, "First with Feathering" in 1934, when it equipped its Consolidated P2Y-3 Patrol Planes with Curtiss Electric Propellers, is again First in developing, with Curtiss engineers, the Reverse-pitch Propeller to provide its giant seaplanes with water-maneuverability hitherto unparalleled. Another degree of utility has thus been added to the outstanding four-engined Consolidated Patrol Bomber.

The adaptability of Curtiss Electrics has also led to their selection for the Navy's newest fast fighters in which air-maneuverability and high performance are paramount.

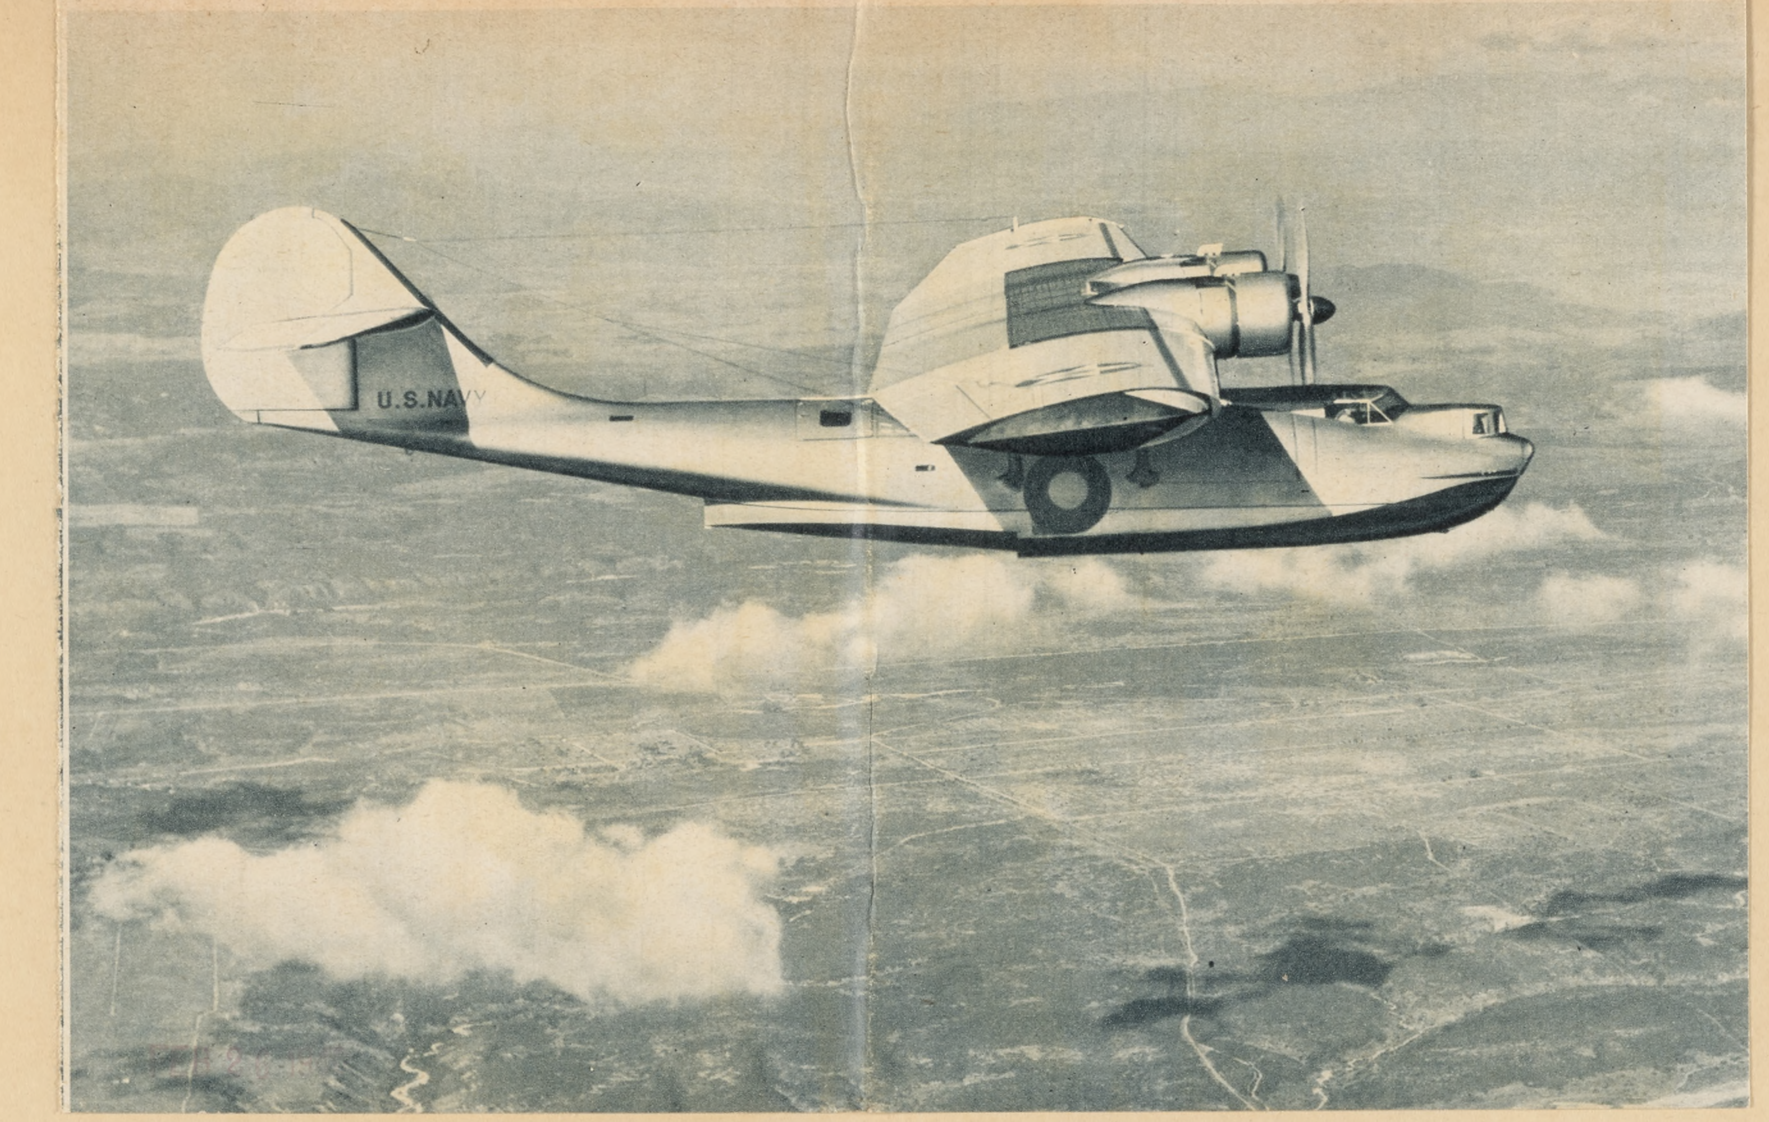
Consolidated PBY-2 in flight

THE LOG FEB. 16, '40

Consolidated Amphibium Modell 28-5 A (Artikel Seite 17).

SWISS AERO-REVUE JAN. 1940



Consolidated Amphibium Modell 28-5 A.

(Bild auf Seite 11.)

SWISS AERO-REVUE JAN. 1940

Aus ihrem bekannten Modell 28, welches bei der U. S. Navy als «PBY Flugboot» bezeichnet wird, hat die Consolidated Aircraft Corporation in San Diego in Kalifornien vor einiger Zeit ein Amphibienflugzeug entwickelt, über welches soeben einige Einzelheiten bekanntgegeben wurden.

Das Flugboot, das bei der Firma Modell 28-5 A und bei der U. S. Navy «XPBY-5 A» heisst, ist das grösste bisher gebaute Amphibienflugzeug. Sonst in fast allen Einzelheiten dem Modell 28 gleichend, hat es ein Dreiradfahrgestell bekommen, bei dem alle drei Räder einziehbar sind. Das vordere Rad, das bei der Landung aus dem Bug herausragt, wird während des Fluges in den Rumpf zurückgezogen, wobei das etwa eingedrungene Seewasser erst vollständig auslaufen muss, ehe sich die Verschlussklappe dicht schliessen kann. Die beiden unter der Tragfläche liegenden Haupträder klappen sich nach oben und seitlich in für sie vorgesehene Vertiefungen ein.

Die bekannt guten Flugeigenschaften des Modells 28 sind durch diesen Zusatz in keiner Weise beeinträchtigt oder verändert worden. Es ist in jeder Hinsicht das gleiche Flugboot, nur dass es mit dem zusätzlichen Landegestell nun auch Landflugplätze anlaufen kann. Ausgedehnte Versuche haben ergeben, dass es gelegentlich auch von Vorteil ist, das Fahrgestell im Wasser auszustrecken. Die Räder haben dann die Wirkung von See-Ankern, d. h. sie erhöhen durch ihren Wasserwiderstand die Stabilität des Flugbootes. Das ist besonders beim Schwimmen auf grober See vorteilhaft, zwar wird die Schwimmgeschwindigkeit etwas herabgesetzt, aber ein ruhigeres Fahren gewährleistet.

Mit ausgestrecktem Fahrgestell kann das Flugboot auch einen flachen Strand aus eigener Kraft erklimmen, ohne auf eine besondere Landemannschaft angewiesen zu sein. Ebenfalls kann es vom Ufer aus sich aus eigener Kraft in das Wasser gleiten lassen, um dann von der Wasserfläche aus abzufliegen. Es ist natürlich sehr oft leichter, ein auf dem Strande festliegendes Flugboot mit Brennstoff zu beladen, als ein schwimmendes.

Consair Gets Permit For $1,050,000 Unit

San Diego's biggest single building permit in almost 15 years was issued yesterday when Consolidated Aircraft Corp., was granted a permit to build their $1,050,000 plant addition.

Recalling big permits of the past, Oscar Knecht, city building inspector, said last night that the permit for building the Civic Center totaled more, but was taken out in two parts. Last one of that size, he recalled, was about 1926 when the San Diego Trust and Savings Bank building was constructed.

The Consolidated permit calls for erection of six steel and sheet metal buildings which will house factory and office space and provide additional store room.

Issuance of the permit brought the year's total for the city to $2,741,579, compared to $1,068,963 for the same period last year.

$1,050,000 ADDED TO PERMIT TOTAL BY CONSOLIDATED

Preparatory to doubling their output and workers' staff, Consolidated Aircraft Co. today was issued a permit authorizing construction of six new manufacturing and assembly buildings, cost of which is estimated at $1,050,000.

Issuance of the building permit swelled the month's permits to $1,600,523 as compared with $451,766 of a year ago and raised the year's total to $2,741,579, more than double last year's figure of $1,039, 54.

The permit issued today provides for construction of six steel and sheet metal buildings, according to Oscar Knecht, city building inspector, plans for all of which were drafted by Architect Edward Cray Taylor. All are to be built under direction of Ellis Wing Taylor, contractor.

The structures contemplated, several of which are now under construction, include one assembly plant, 50 by 125 feet; a manufacturing building, 300 to 720 feet; another 120 by 240 feet; an office building, 50 by 200 feet; a boiler house, 50 by 100 feet, and a material and store building, 30 by 1000 feet.

Work already is under way on two of the structures and will be pushed as rapidly as possible to allow work of construction on a number of new planes, contracts for which have been awarded by the army and navy departments.

It is estimated that with completion of the new buildings the working staff at the plant will be increased from 4100 to more than 7500 men.

TRIB 2-28-40

What of the Past—and the Future?

Recently CONTACT asked outstanding figures in the aeronautical industry the following questions:

1 What do you consider the greatest contribution to the progress of Aviation during the year 1939?

2 What is the biggest job confronting Aviation for the year 1940?

On this page appear the replies—a concensus of opinion representing a cross section of the industry—manufacturers, commercial airlines, airports, schools, etc.

Edgar N. Gott
Vice-President Consolidated Aircraft Corporation

San Diego, Calif.

It is the writer's personal opinion that the greatest contribution to progress of Aviation in 1939 was the successful operation by the Navy of its patrol planes on mass flights; and of the new flying boat bases established on both the Atlantic and Pacific oceans.

It is felt that the biggest problem for 1940 will be for the industry to fill the orders on hand without excessive plant expansion, which might later become idle.

5416 Employed Here In Aircraft Plants

UNION 2-28-40

A total of 5416 men and women are employed at the Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co. plants, officials announced yesterday.

Forty-one hundred are employed at Consolidated, 850 at Ryan and 466 at Solar.

Personnel of the Douglas Aircraft Co.'s factories at Santa Monica and El Segundo total 15,000, according to Carl A. Cover, general manager. The Douglas payroll last week was in excess of $440,000.

There are 11,700 employed at the Santa Monica plant and 3300 at El Segundo.

Cite Need For Trained Aircraft Workers at San Diego Factories

CONTACT FEB. 1940

Personnel Managers of Plane Plants Prepare To Meet Coming Demand

More than 3000 factory workers will have to be added to the payrolls of San Diego aircraft factories during the balance of the year in order to meet the heavy production schedules called for in filling the more than $50,000,000 in plane orders now on hand.

Such is the aircraft employment situation as outlined there recently at a meeting of personnel managers of the Consolidated, Ryan and Solar aircraft factories.

So that Southern California labor may be employed in preference to out-of-state workers, it will be necessary to train hundreds of skilled technicians during the coming months, according to Marvin Marco, employment manager of one of the local plants.

In order that competent, industry-recognized training may be available to those interested in factory employment, the long-established Ryan School of Aeronautics, San Diego, is now organizing special Sheet Metal classes designed specifically to equip local workers for factory employment in the shortest time consistent with proper training.

Complete in scope, the new Ryan sheet metal course offers 200 hours of technical training in blue print reading, metallurgy, layout and patterns, riveting, assembly, forming, drilling, filing and bumping. Lasting five weeks, the training is given eight hours a day, Monday through Friday.

JAN 15 1940

BRITISH TO BUY MORE AIRCRAFT

Purchase of 10,000 Planes in U. S. During Next 18-Month Period Is Planned

Dow Jones News Service

WASHINGTON—British plans for the purchase of approximately 10,000 military airplanes in this country during the next 18 months were placed before United States Government officials recently, it was learned last night.

This figure is based upon British estimates of the amount of foreign help necessary in order to achieve air supremacy over Germany by the middle of 1941, it is understood.

As far as can be determined, it does not take into account the extent of possible French purchases here. In view of the coordination of the procurement agencies of the two Allies, however, it is thought that it will be increasingly difficult to draw a sharp distinction between their respective purchases.

British Output Near 1,000 Monthly

Plans to place orders in the United States for 10,000 planes during 1940 and the first half of 1941 were discussed informally with Washington authorities by a high ranking official of the British Empire who paid a brief visit here several weeks ago, it was learned. Apparently he went away satisfied.

Latest reports current in Washington are that British air production is now in the neighborhood of 1,000 planes a month. A number of new large factories are understood to be practically finished and equipped, and it is reported that when they get into production Great Britain will be equipped to turn out about 2,200 planes a month. Efforts to speed up French air factory schedules have been disappointing to the Allies, and French current production is reported to be still short of 300 a month.

Although accurate estimates, of course, are impossible to obtain, some Government officials believe that the current German air production is at the rate of about 2,000 planes a month. Combined British and French purchases in the United States since before the outbreak of the war are estimated at about 5,000 craft.

In the event of a large-scale German air offensive in the spring, which Prime Minister

little more than four times the $156,000,000 reported a year previous. In both instances there is a certain amount of duplication where—in the case of some foreign orders—airplane companies have reported in their backlogs such equipment as engines, propellers and the like which are also included in the unfilled orders of the actual manufacturer. These backlog totals do not include a large amount of accessory and equipment business ordered by the purchasers directly from those manufacturers.

Estimated unfilled orders of 15 aircraft companies as of January 1, 1940, and a year earlier, compare as follows:

	Jan. 1, 1940	Jan. 1, 1939
*Allison	$16,000,000	......
Bell	8,000,000	$3,675,000

Consolidated Installs Four "Earthquakes"

By David Hellyer

"FIGURATIVELY speaking, gentlemen, our problem is to confine an earthquake to a teacup."

Thus William A. Maloney, plant engineer of the Consolidated Aircraft Corporation of San Diego, Calif., summarized the engineering problem facing his firm in the installation of four new Chambersburg drop hammers to be used in shaping duralumin parts for Consolidated's flying boats. He was speaking to Ellis Wing Taylor, Los Angeles consulting engineer, and Edmund G. Grant, mechanical technician for the astrophysical laboratory at California Institute of Technology.

Taylor, as an expert in his field, and Grant, the engineer who solved the vibration-isolation problem on the giant new 200-inch Palomar telescope near San Diego, were well equipped to collaborate with Maloney, who is himself a recognized authority. It is interesting to note, however, that the problem facing Consolidated was the exact reverse of that which confronted the engineers at Palomar. In setting up the telescope, the engineers were put to the necessity of finding a way to keep vibration *out* of the "teacup," while at Consolidated the problem consisted in confining vibration *to* the "teacup."

"We must mount these hammers," asserted Maloney, "so that they may operate efficiently in relation to other equipment on the production line and still not disturb nearby machines and offices by the vibration caused by the terrific pounding."

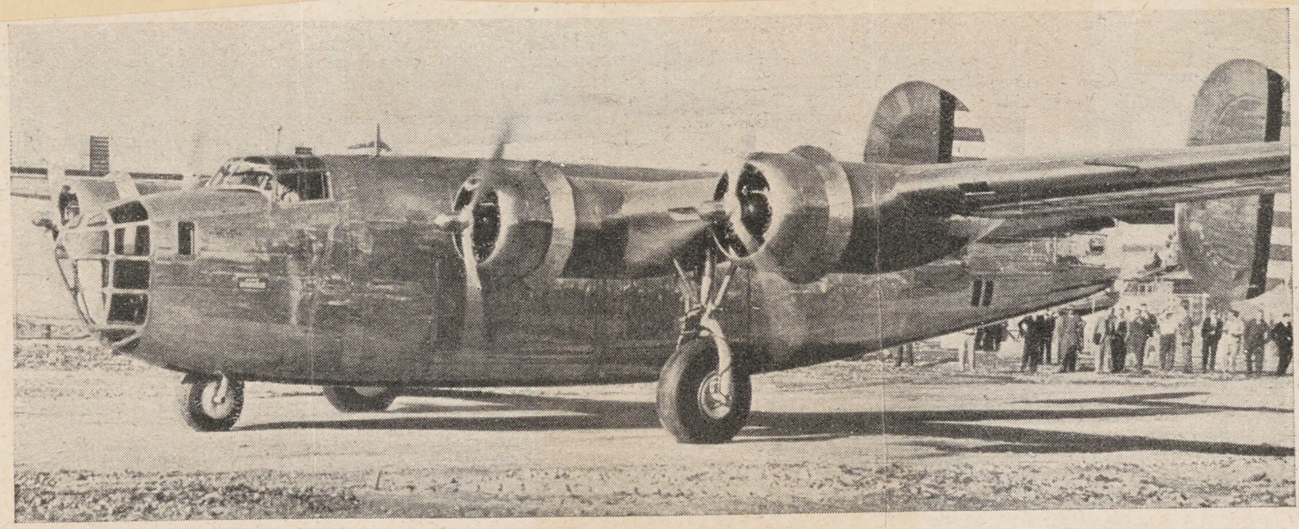
Welding Splice in Steel H-Pile for Drop Hammer Foundation at Plant of Consolidated Aircraft Corporation

---



FASTEST OF THE BIG BOMBERS is this new Consolidated, the prototype of a batch for the U.S. Army Air Corps. It will be noted that it has a tail turret and that in certain respects, notably in the somewhat ugly design of the tail, it resembles the Model 31 flying boat. It is reported that this new machine "approaches a speed of 335 m.p.h.," presumably at very high altitudes.

FLIGHT Feb. 1, 1940

Consair Steel For Buildings On Way Here

UNION 3/8/40

Fabricated steel for new buildings soon to be constructed at the Consolidated Aircraft Co.'s plant is included in the cargo of the American Hawaiian freighter American due Thursday from Philadelphia.

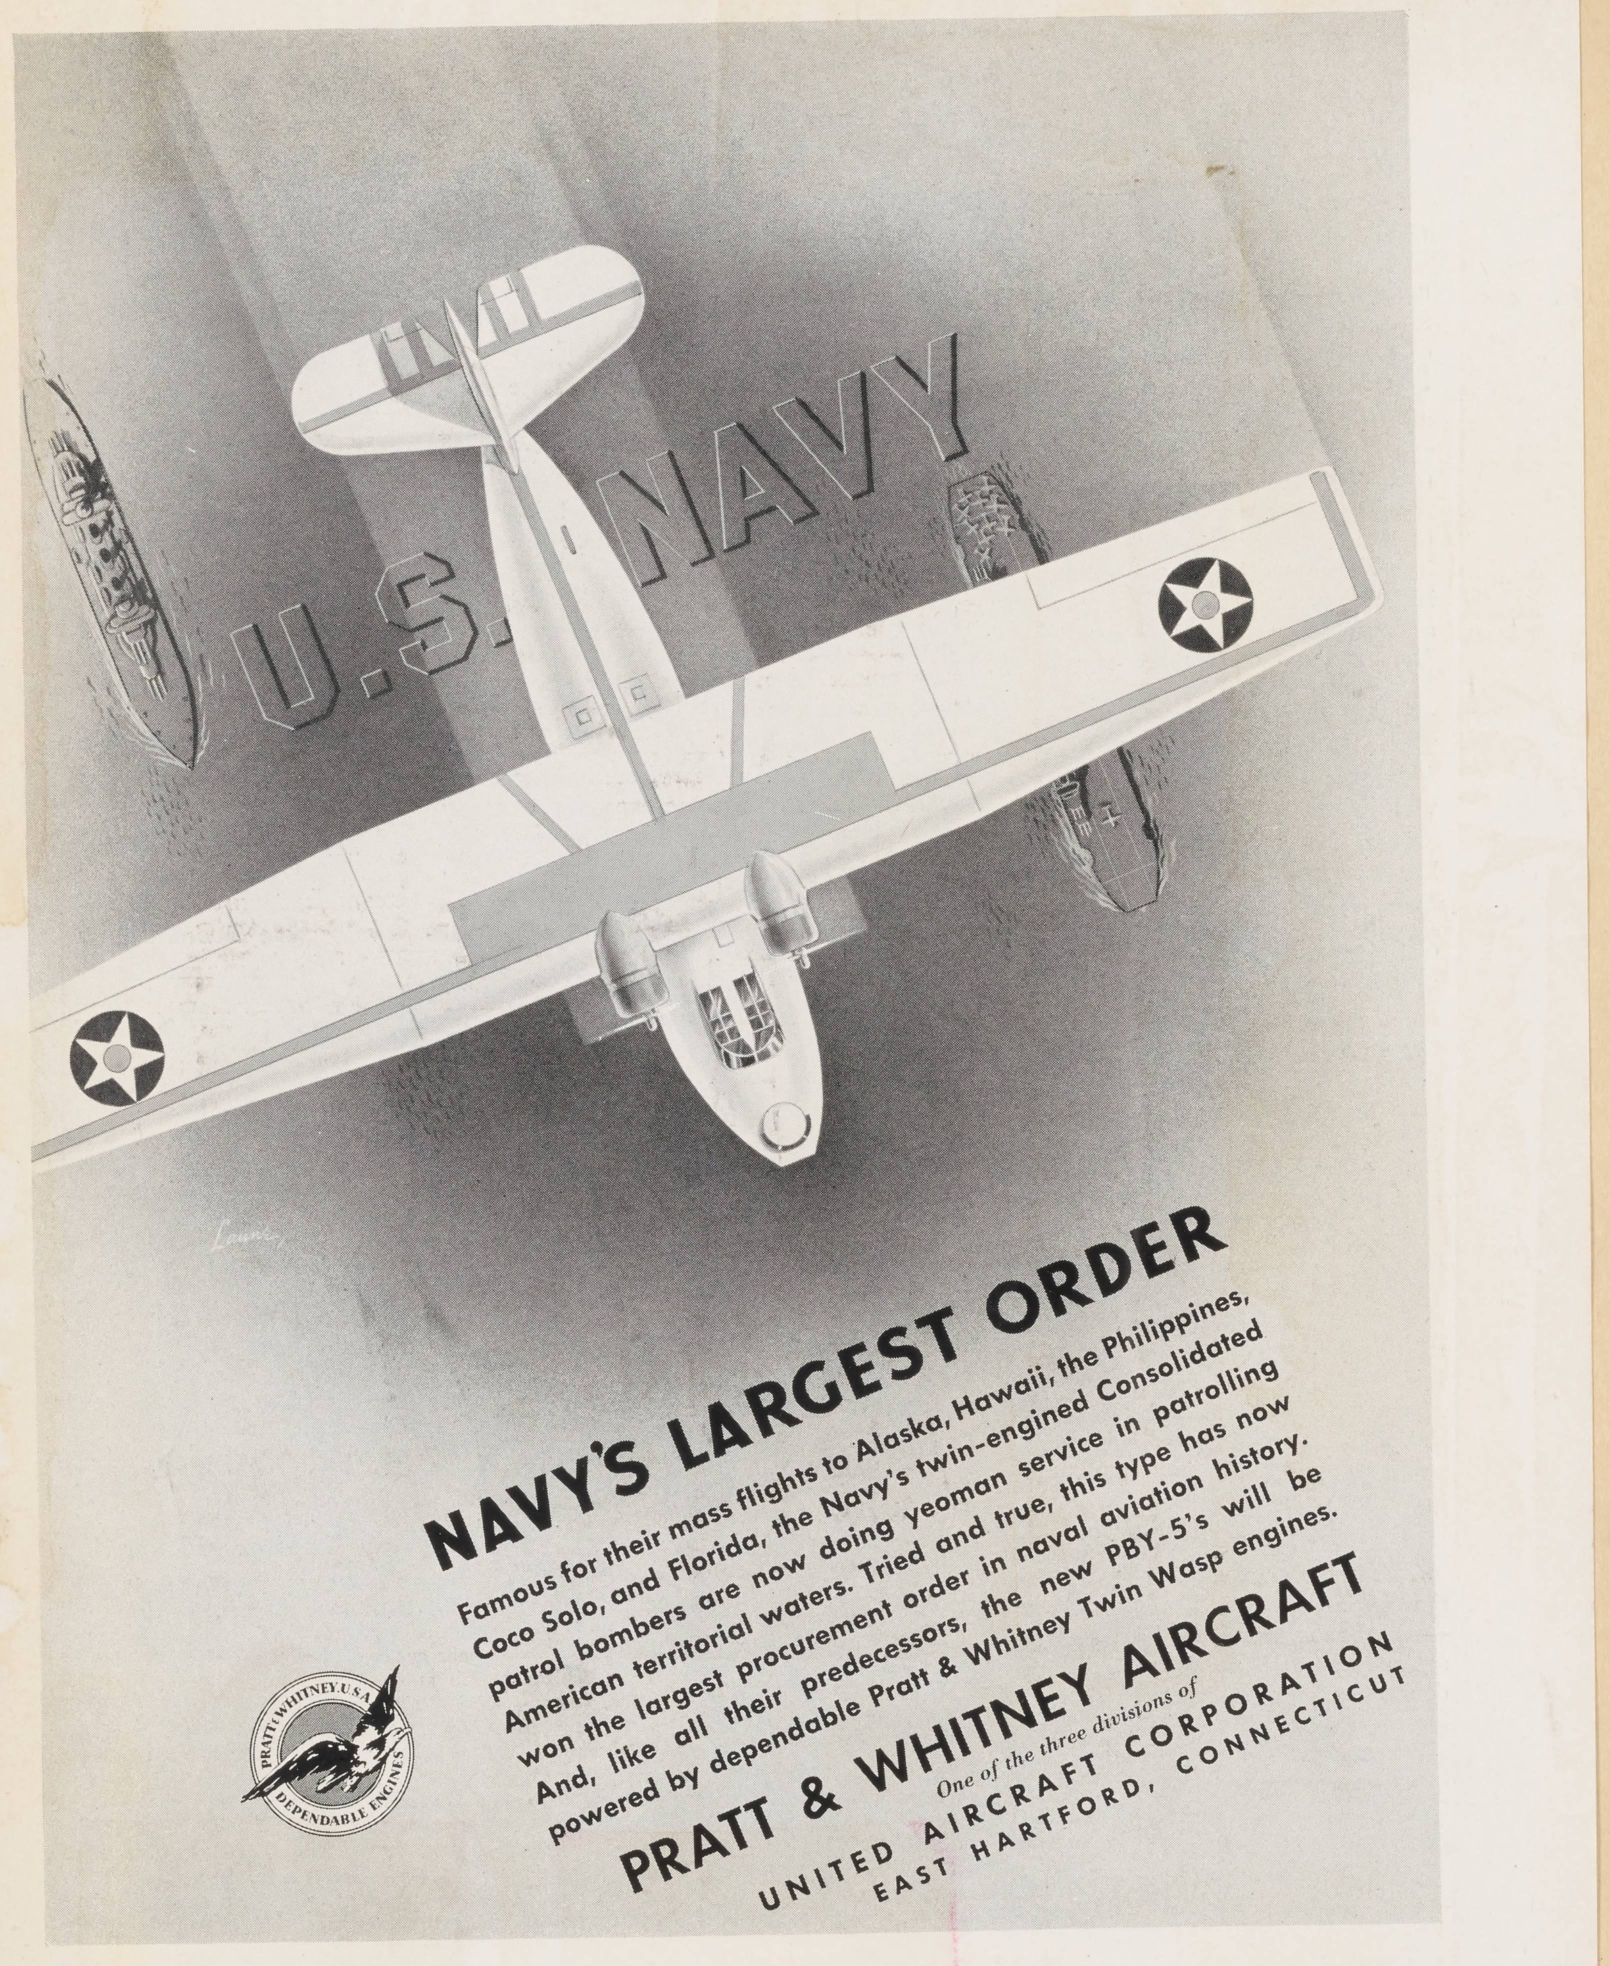
The American is one of a fleet of eight intercoastal vessels to call here in the next three weeks, all of them laden to the plimsoll mark.

Aircraft Firms Seen By Metallurgist

TRIB 3/7/40

Dr. E. H. Dix jr., chief metallurgist of the Aluminum Co. of America, today visited the Consolidated, Ryan and Solar Aircraft factories, conferring with officials at the plants on the latest developments in aluminum, used in the manufacture of planes because of its lightness. Accompanying Dix were M. J. Moffett, southern California district representative; W. C. Lynch, Los Angeles manager, and C. Pyne Frederick, sales manager, Pittsburgh, Pa.

This evening Dix will be honor guest at a dinner at the San Diego hotel, at which Consolidated representatives, T. Claude Ryan, head of the Ryan Co., and Edmund T. Price, Solar head, will attend. Others at the dinner will be Maj. Edwin R. McReynolds, army air corps aircraft factory representative, and Comdr. R. G. Mayer, navy representative. Following the dinner, a closed meeting will be held at the chamber of commerce, at which Dix will show pictures and lecture on the latest aluminum developments.



NAVY'S LARGEST ORDER

Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. REVIEW *and* OUTLOOK

Opinion vs. Legislation

The Senate will probably take up soon the Logan-Walters bill which passed that body by unanimous consent at the last session, but was not acted upon by the House. As most people know, the purpose of this bill is to tighten up the procedure of various administrative bodies and commissions, and facilitate a review by the courts of quasi-judicial decisions by these agencies.

That there is need for legislative action in both directions has become increasingly evident since this bill was first introduced. Everyone will admit that the strict rules of court procedure in the matter of testimony are neither necessary nor fully appropriate in the forum of administrative law and that a certain degree of latitude must be accorded in the latter practice. It is, however, manifest that there is need for reform in the practice of some of these bodies around which has gathered a storm of criticism that is substantial in character and impressive in volume. Furthermore, it is clear that there is need for bringing within court review a class of quasi-judicial decisions not at present reached by such review.

In dealing with this problem, however, Congress will be well-advised to avoid the danger of rushing from one extreme to the other, and by so doing nullify its effort at reform. The truth of the matter is that in this department of government the all-important thing is the personnel to whom the extensive powers which must be delegated are entrusted. No rules

BRITISH TO BUY MORE AIRCRAFT

Continued from First Page

Chamberlain and other British statesmen have repeatedly predicted, it is considered almost inevitable that both foreign and domestic demands on the American industry will be greatly increased. British estimates of their own needs from foreign sources are based on the theory that their own airplane plants will not suffer severe damage from enemy air raids and that their losses in the air will not be substantial. It is believed in Washington that a violent intensification of the European war in the spring would promptly be echoed in increased demands from the United States War and Navy departments for more military planes.

Government estimates of current production in the United States aircraft industry show its potential production rate is approximately 17,000 planes a year. Certain officials are understood to be concerned, however, by the lag in engine production which is reported at the rate of only about 12,000 a year. As far as can be learned, however, there is no intention on the part of the Government at the present time to intervene directly in this situation.

In addition to British and French business, it is surmised in official quarters, other foreign governments, particularly the small neutrals, will place increasingly larger orders in this country. The last report of the Munitions Control Board gave indications of this trend, and it was officially predicted that future reports would show a continuation in that direction.

little more than four times the $156,000,000 reported a year previous. In both instances there is a certain amount of duplication where—in the case of some foreign orders—airplane companies have reported in their backlogs such equipment as engines, propellers and the like which are also included in the unfilled orders of the actual manufacturer. These backlog totals do not include a large amount of accessory and equipment business ordered by the purchasers directly from those manufacturers.

Estimated unfilled orders of 15 aircraft companies as of January 1, 1940, and a year earlier, compare as follows:

	Jan. 1, 1940	Jan. 1, 1939
*Allison	$16,000,000	......
Bell	8,000,000	$3,675,000
†Beech	1,473,876	......
Boeing	27,000,000	14,894,918
Brewster	10,900,000	......
Consolidated	37,000,000	2,798,881
Curtiss-Wright	170,000,000	33,000,000
‡Douglas	76,000,000	22,500,926
Grumman	4,200,000	3,500,000
Lockheed	46,000,000	33,330,587
Glenn L. Martin	48,000,000	13,903,006
North American	46,000,000	10,914,000
Republic	11,500,000	......
United Aircraft	140,000,000	17,463,969
Vultee	6,300,000	......
Total	$648,373,876	$155,979,287

* Wholly owned subsidiary of General Motors. † For fiscal year ended September 30. ‡ For fiscal year ended November 30.

Sales Gain 50% Over 1938

Sales by these 15 companies during 1939 approximated $238,000,000, a gain of 50% over the $158,000,000 reported for 1938.

Earnings, however, did not show as large a gain as might be expected from such a sharp rise in sales volume, the total being estimated at $28,000,000 for the past year as compared with $17,749,456 for 1938. This gain in profits of 58% was distorted somewhat by the large loss experienced by Boeing which made

Consolidated Installs Four "Earthquakes"

By David Hellyer

"FIGURATIVELY speaking, gentlemen, our problem is to confine an earthquake to a teacup."

Thus William A. Maloney, plant engineer of the Consolidated Aircraft Corporation of San Diego, Calif., summarized the engineering problem facing his firm in the installation of four new Chambersburg drop hammers to be used in shaping duralumin parts for Consolidated's flying boats. He was speaking to Ellis Wing Taylor, Los Angeles consulting engineer, and Edmund G. Grant, mechanical technician for the astrophysical laboratory at California Institute of Technology.

Taylor, as an expert in his field, and Grant, the engineer who solved the vibration-isolation problem on the giant new 200-inch Palomar telescope near San Diego, were well equipped to collaborate with Maloney, who is himself a recognized authority. It is interesting to note, however, that the problem facing Consolidated was the exact reverse of that which confronted the engineers at Palomar. In setting up the telescope, the engineers were put to the necessity of finding a way to keep vibration *out* of the "teacup," while at Consolidated the problem consisted in confining vibration *to* the "teacup."

"We must mount these hammers," asserted Maloney, "so that they may operate efficiently in relation to other equipment on the production line and still not disturb nearby machines and offices by the vibration caused by the terrific pounding."

Consair Steel For Buildings On Way Here

UNION 3/8/40

Fabricated steel for new buildings soon to be constructed at the Consolidated Aircraft Co.'s plant is included in the cargo of the American Hawaiian freighter American due Thursday from Philadelphia.

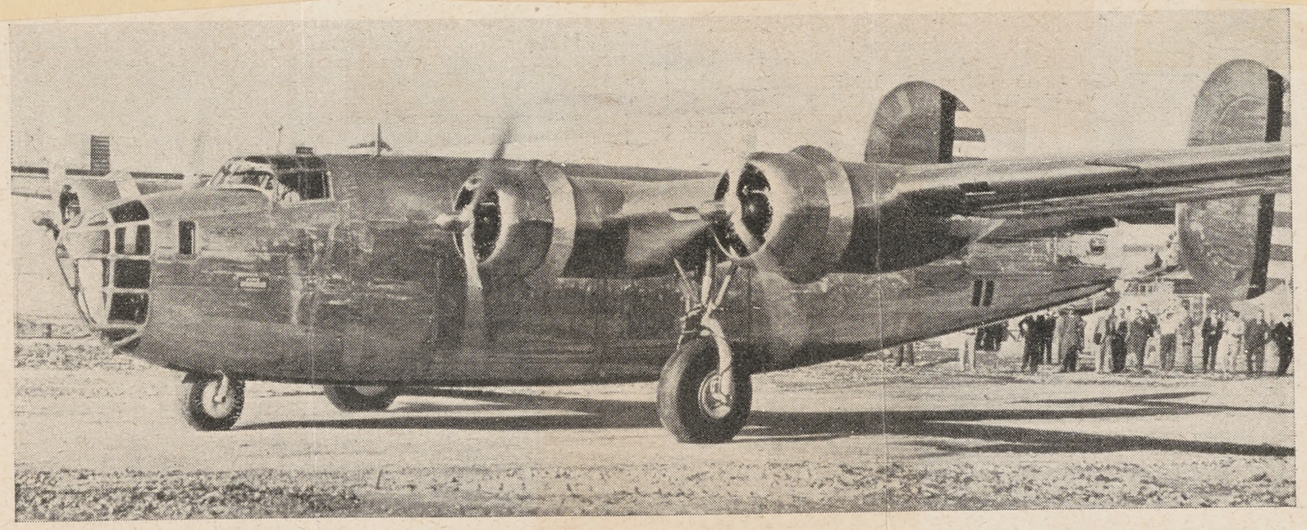
The American is one of a fleet of eight intercoastal vessels to call here in the next three weeks, all of them laden to the plimsoll mark.

Aircraft Firms Seen By Metallurgist

TRIB 3/7/40

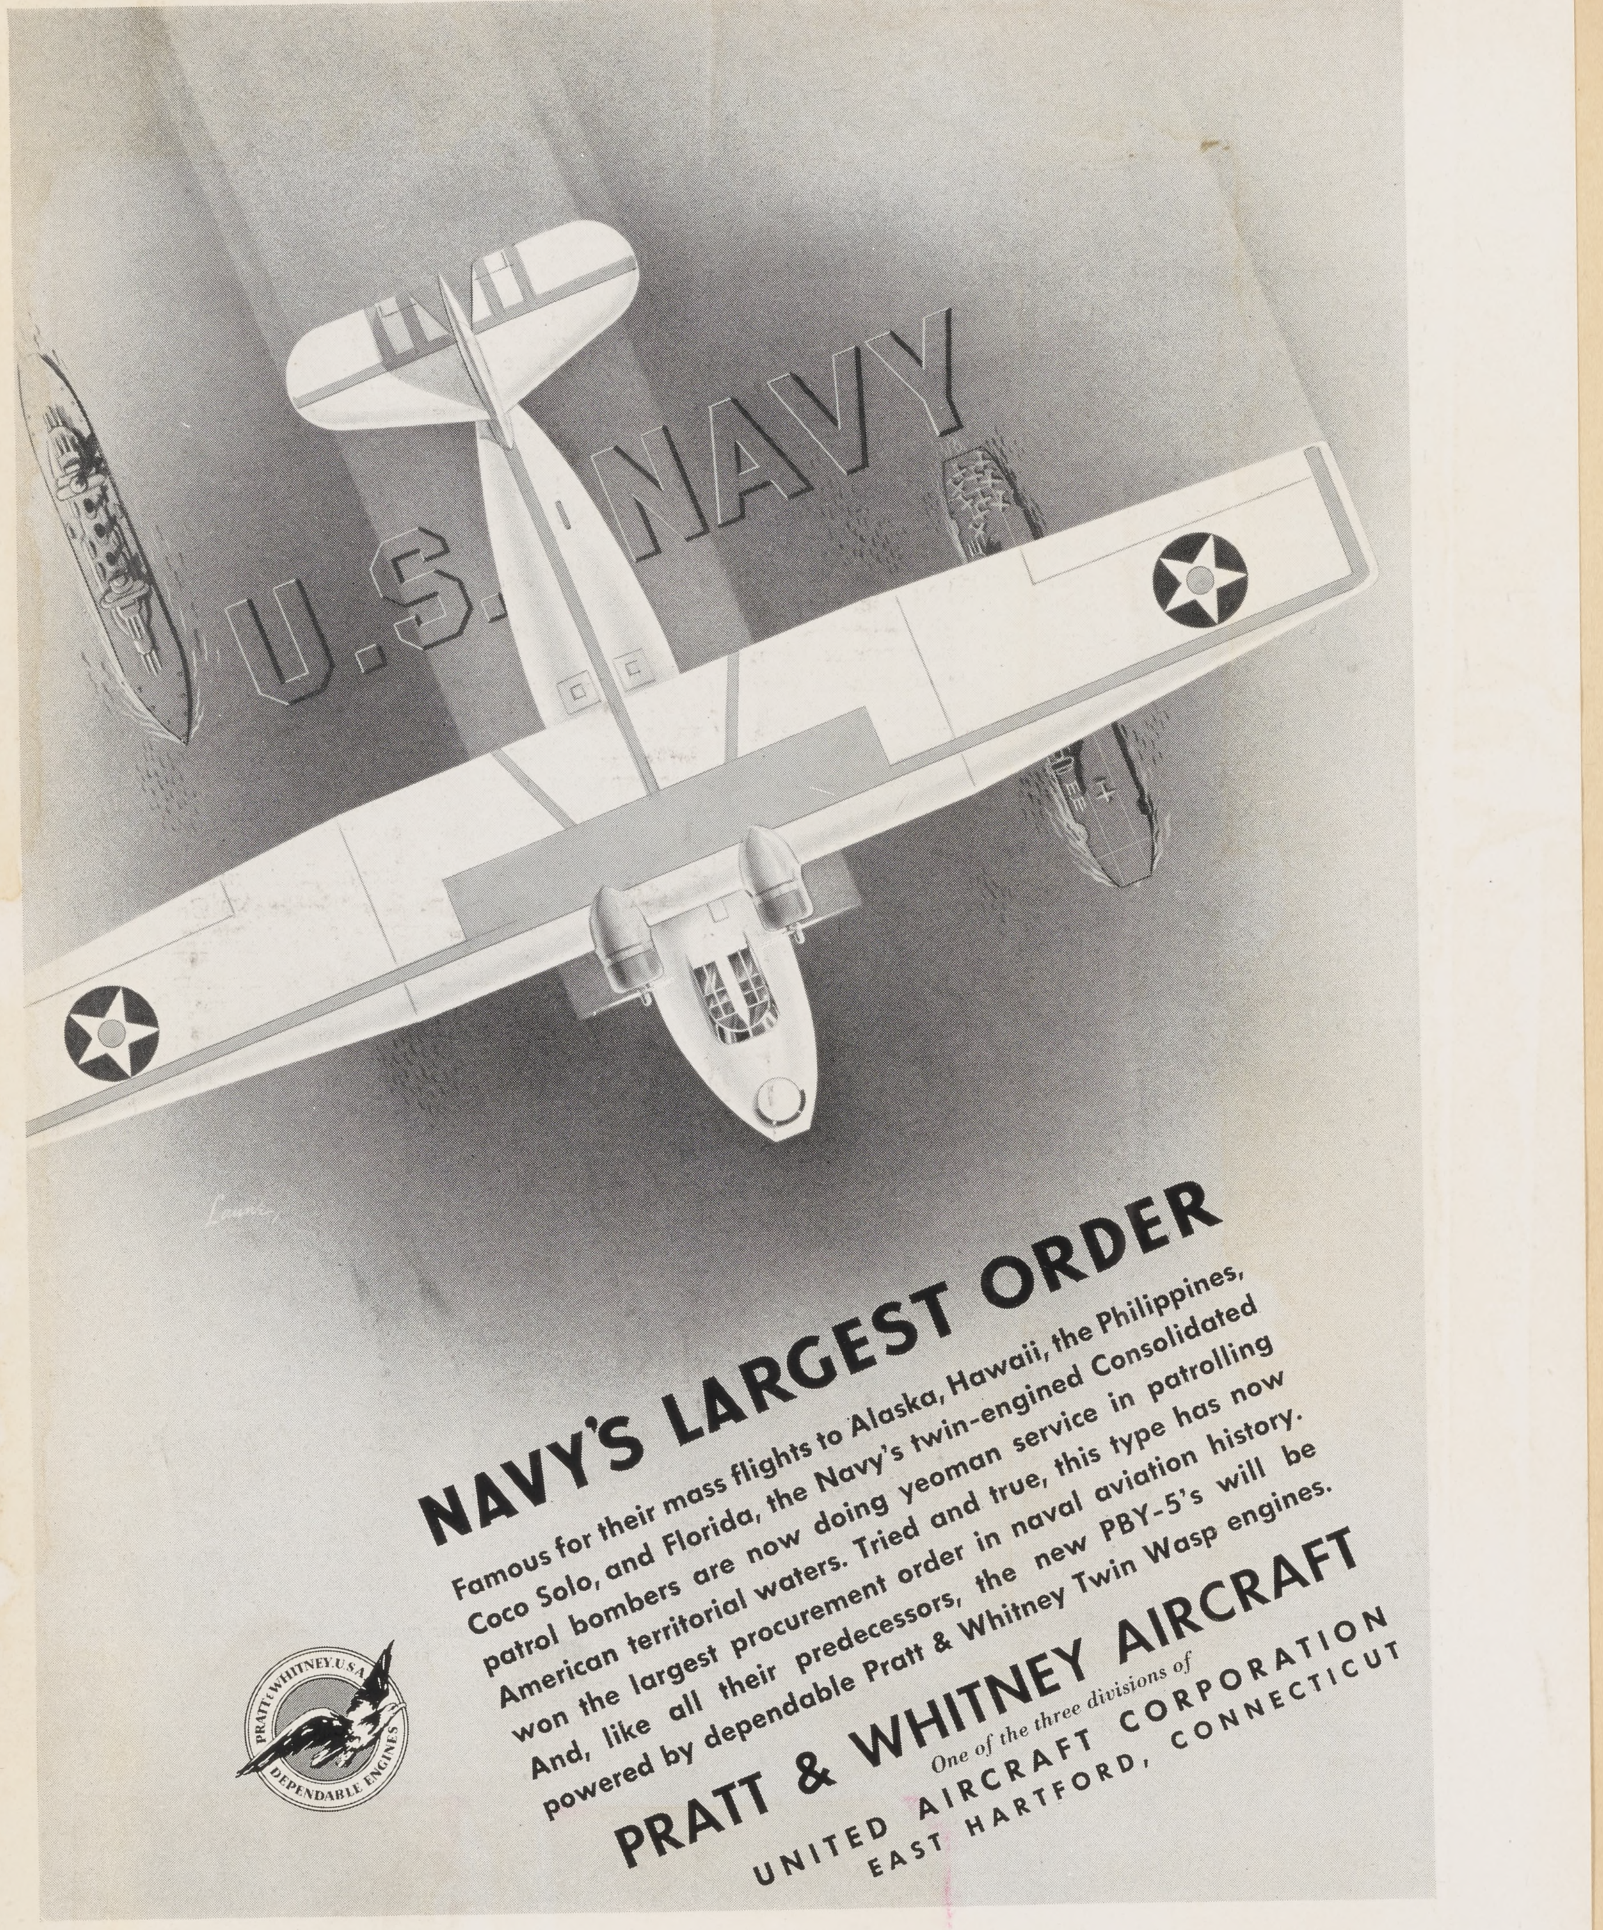
Dr. E. H. Dix jr., chief metallurgist of the Aluminum Co. of America, today visited the Consolidated, Ryan and Solar Aircraft factories, conferring with officials at the plants on the latest developments in aluminum, used in the manufacture of planes because of its lightness. Accompanying Dix were M. J. Moffett, southern California district representative; W. C. Lynch, Los Angeles manager, and C. Pyne Frederick, sales manager, Pittsburgh, Pa.

This evening Dix will be honor guest at a dinner at the San Diego hotel, at which Consolidated representatives, T. Claude Ryan, head of the Ryan Co., and Edmund T. Price, Solar head, will attend. Others at the dinner will be Maj. Edwin R. McReynolds, army air corps aircraft factory representative, and Comdr. R. G. Mayer, navy representative. Following the dinner, a closed meeting will be held at the chamber of commerce, at which Dix will show pictures and lecture on the latest aluminum developments.



FASTEST OF THE BIG BOMBERS is this new Consolidated, the prototype of a batch for the U.S. Army Air Corps. It will be noted that it has a tail turret and that in certain respects, notably in the somewhat ugly design of the tail, it resembles the Model 31 flying boat. It is reported that this new machine "approaches a speed of 335 m.p.h.," presumably at very high altitudes.

FLIGHT Feb 1, 1940



NAVY'S LARGEST ORDER

Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

Consair Gets Permit For $1,050,000 Unit

San Diego's biggest single building permit in almost 15 years was issued yesterday when Consolidated Aircraft Corp., was granted a permit to build their $1,050,000 plant addition.

Recalling big permits of the past, Oscar Knecht, city building inspector, said last night that the permit for building the Civic Center totaled more, but was taken out in two parts. Last one of that size, he recalled, was about 1926 when the San Diego Trust and Savings Bank building was constructed.

The Consolidated permit calls for erection of six steel and sheet metal buildings which will house factory and office space and provide additional store room.

Issuance of the permit brought the year's total for the city to $2,741,579, compared to $1,068,963 for the same period last year.

$1,050,000 ADDED TO PERMIT TOTAL BY CONSOLIDATED

Preparatory to doubling their output and workers' staff, Consolidated Aircraft Co. today was issued a permit authorizing construction of six new manufacturing and assembly buildings, cost of which is estimated at $1,050,000.

Issuance of the building permit swelled the month's permits to $1,600,523 as compared with $451,766 of a year ago and raised the year's total to $2,741,579, more than double last year's figure of $1,039, 54.

The permit issued today provides for construction of six steel and sheet metal buildings, according to Oscar Knecht, city building inspector, plans for all of which were drafted by Architect Edward Cray Taylor. All are to be built under direction of Ellis Wing Taylor, contractor.

The structures contemplated, several of which are now under construction, include one assembly plant, 50 by 125 feet; a manufacturing building, 300 to 720 feet; another 120 by 240 feet; an office building, 50 by 200 feet; a boiler house, 50 by 100 feet, and a material and store building, 30 by 1000 feet.

Work already is under way on two of the structures and will be pushed as rapidly as possible to allow work of construction on a number of new planes, contracts for which have been awarded by the army and navy departments.

It is estimated that with completion of the new buildings the working staff at the plant will be increased from 4100 to more than 7500 men.

TRIB 2-28-40

What of the Past—and the Future?

Recently CONTACT asked outstanding figures in the aeronautical industry the following questions:

1 What do you consider the greatest contribution to the progress of Aviation during the year 1939?

2 What is the biggest job confronting Aviation for the year 1940?

On this page appear the replies—a concensus of opinion representing a cross section of the industry—manufacturers, commercial airlines, airports, schools, etc.

Edgar N. Gott
Vice-President Consolidated Aircraft Corporation

San Diego, Calif.

It is the writer's personal opinion that the greatest contribution to progress of Aviation in 1939 was the successful operation by the Navy of its patrol planes on mass flights; and of the new flying boat bases established on both the Atlantic and Pacific oceans.

It is felt that the biggest problem for 1940 will be for the industry to fill the orders on hand without excessive plant expansion, which might later become idle.

CONTACT ——o—— FEB. 40

5416 Employed Here In Aircraft Plants

UNION 2-28-40

A total of 5416 men and women are employed at the Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co. plants, officials announced yesterday.

Forty-one hundred are employed at Consolidated, 850 at Ryan and 466 at Solar.

Personnel of the Douglas Aircraft Co.'s factories at Santa Monica and El Segundo total 15,000, according to Carl A. Cover, general manager. The Douglas payroll last week was in excess of $440,000.

There are 11,700 employed at the Santa Monica plant and 3300 at El Segundo.

Cite Need For Trained Aircraft Workers at San Diego Factories

CONTACT FEB. 1940

Personnel Managers of Plane Plants Prepare To Meet Coming Demand

More than 3000 factory workers will have to be added to the payrolls of San Diego aircraft factories during the balance of the year in order to meet the heavy production schedules called for in filling the more than $50,000,000 in plane orders now on hand.

Such is the aircraft employment situation as outlined there recently at a meeting of personnel managers of the Consolidated, Ryan and Solar aircraft factories.

So that Southern California labor may be employed in preference to out-of-state workers, it will be necessary to train hundreds of skilled technicians during the coming months, according to Marvin Marco, employment manager of one of the local plants.

In order that competent, industry-recognized training may be available to those interested in factory employment, the long-established Ryan School of Aeronautics, San Diego, is now organizing special Sheet Metal classes designed specifically to equip local workers for factory employment in the shortest time consistent with proper training.

Complete in scope, the new Ryan sheet metal course offers 200 hours of technical training in blue print reading, metallurgy, layout and patterns, riveting, assembly, forming, drilling, filing and bumping. Lasting five weeks, the training is given eight hours a day, Monday through Friday.

EET JOURNAL, WEDNESDAY, JANUARY 10, 1940

BRITISH TO BUY MORE AIRCRAFT

Continued from First Page

Chamberlain and other British statesmen have repeatedly predicted, it is considered almost inevitable that both foreign and domestic demands on the American industry will be greatly increased. British estimates of their own needs from foreign sources are based on the theory that their own airplane plants will not suffer severe damage from enemy air raids and that their losses in the air will not be substantial. It is believed in Washington that a violent intensification of the European war in the spring would promptly be echoed in increased demands from the United States War and Navy departments for more military planes.

Government estimates of current production in the United States aircraft industry show its potential production rate is approximately 17,000 planes a year. Certain officials are understood to be concerned, however, by the lag in engine production which is reported at the rate of only about 12,000 a year. As far as can be learned, however, there is no intention on the part of the Government at the present time to intervene directly in this situation.

In addition to British and French business, it is surmised in official quarters, other foreign governments, particularly the small neutrals, will place increasingly larger orders in this country. The last report of the Munitions Control Board gave indications of this trend, and it was officially predicted that future reports would show a continuation in that direction.

Aircraft Backlogs

NEW YORK—New business booked by the aircraft manufacturers continues to run well in excess of production despite the increasing rate of deliveries and volume of unfilled orders established a new peak at the beginning of this year.

Orders placed with the primary companies during December approximated $75,000,000 while deliveries ran around $25,000,000. The preponderance of incoming business over deliveries averaged about this same 3 to 1 ratio for the entire year 1939. Indicated new business signed by 15 companies during the year amounted to $715,000,000 while deliveries by the same group totaled approximately $238,000,000.

Companies sharing in the new contracts awarded during December and the amounts added to their backlogs in excess of deliveries are estimated as follows: Consolidated, $20,000,000; Curtiss-Wright, $16,000,000; Lockheed, $20,000,000; Republic, $1,300,000; and United Aircraft, $15,000,000. There also were several miscellaneous contracts awarded during the month.

Douglas Contracts

Since beginning of 1940, Douglas Aircraft Co. announced that contracts are in final stage of negotiation for $14,000,000 worth of its new DC-4 commercial transport. Other contracts that are understood to be near the signing stage include: A British order from Douglas for between $30,000,000 and $40,000,000 of attack bombers for 1941 delivery; a British contract with Consolidated Aircraft for approximately $5,000,000 of patrol bombers; another French order with Glenn L. Martin Co., one or more British contracts for pursuit planes.

Total backlog of the 15 companies on January 1, 1940, is estimated at $648,000,000, or a little more than four times the $156,000,000 reported a year previous. In both instances there is a certain amount of duplication where—in the case of some foreign orders—airplane companies have reported in their backlogs such equipment as engines, propellers and the like which are also included in the unfilled orders of the actual manufacturer. These backlog totals do not include a large amount of accessory and equipment business ordered by the purchasers directly from those manufacturers.

Estimated unfilled orders of 15 aircraft companies as of January 1, 1940, and a year earlier, compare as follows:

	Jan. 1, 1940	Jan. 1, 1939
*Allison	$16,000,000	......
Bell	8,000,000	$3,675,000
†Beech	1,473,876	......
Boeing	27,000,000	14,894,918
Brewster	10,900,000	......
Consolidated	37,000,000	2,798,881
Curtiss-Wright	170,000,000	33,000,000
‡Douglas	76,000,000	22,500,926
Grumman	4,200,000	3,500,000
Lockheed	46,000,000	33,330,587
Glenn L. Martin	48,000,000	13,903,006
North American	46,000,000	10,914,000
Republic	11,500,000	......
United Aircraft	140,000,000	17,463,969
Vultee	6,300,000	......
Total	$648,373,876	$155,979,287

* Wholly owned subsidiary of General Motors. † For fiscal year ended September 30. ‡ For fiscal year ended November 30.

Sales Gain 50% Over 1938

Sales by these 15 companies during 1939 approximated $238,000,000, a gain of 50% over the $158,000,000 reported for 1938.

Earnings, however, did not show as large a gain as might be expected from such a sharp rise in sales volume, the total being estimated at $28,000,000 for the past year as compared with $17,749,456 for 1938. This gain in profits of 58% was distorted somewhat by the large loss experienced by Boeing which made heavy charges against 1939 operations for losses incurred in contracts that have been in process for the past two or three years.

A considerably more liberal policy was followed by the industry as a whole in disbursements to stockholders. During 1939 nine companies paid $16,721,123 out in dividends as compared with $8,593,194 by seven companies during 1938, a gain of 95%.

Current rate of deliveries of $25,000,000 a month by these companies is expected to be doubled within a comparatively short period as new facilities are placed in production and effect of preliminary work begins to be reflected in actual deliveries. Delivery guarantees and penalty clauses in the event that deliveries do not meet predetermined dates indicate the industry will be forced to jump the current rate quickly or be subject to penalties.

Estimated sales and common share earnings of aircraft companies for 1939 compare as follows with reported results for 1938:

	Sales		Com. sh. earnings	
	*1939	1938	*1939	1938
Bell	$100,000	$1,219,253	...	$0.33
†Beech	1,328,296	1,141,399	§...	§...
Boeing	11,000,000	2,006,345	§...	§...
Brewster	600,000	1,490,339	...	.66
Consolidated	3,200,000	12,245,067	...	2.55

Consair Gets Permit For $1,050,000 Unit

San Diego's biggest single building permit in almost 15 years was issued yesterday when Consolidated Aircraft Corp., was granted a permit to build their $1,050,000 plant addition.

Recalling big permits of the past, Oscar Knecht, city building inspector, said last night that the permit for building the Civic Center totaled more, but was taken out in two parts. Last one of that size, he recalled, was about 1926 when the San Diego Trust and Savings Bank building was constructed.

The Consolidated permit calls for erection of six steel and sheet metal buildings which will house factory and office space and provide additional store room.

Issuance of the permit brought the year's total for the city to $2,741,579, compared to $1,068,963 for the same period last year.

$1,050,000 ADDED TO PERMIT TOTAL BY CONSOLIDATED

Preparatory to doubling their output and workers' staff, Consolidated Aircraft Co. today was issued a permit authorizing construction of six new manufacturing and assembly buildings, cost of which is estimated at $1,050,000.

Issuance of the building permit swelled the month's permits to $1,600,523 as compared with $451,766 of a year ago and raised the year's total to $2,741,579, more than double last year's figure of $1,039, 54.

The permit issued today provides for construction of six steel and sheet metal buildings, according to Oscar Knecht, city building inspector, plans for all of which were drafted by Architect Edward Cray Taylor. All are to be built under direction of Ellis Wing Taylor, contractor.

The structures contemplated, several of which are now under construction, include one assembly plant, 50 by 125 feet; a manufacturing building, 300 to 720 feet; another 120 by 240 feet; an office building, 50 by 200 feet; a boiler house, 50 by 100 feet, and a material and store building, 30 by 1000 feet.

Work already is under way on two of the structures and will be pushed as rapidly as possible to allow work of construction on a number of new planes, contracts for which have been awarded by the army and navy departments.

It is estimated that with completion of the new buildings the working staff at the plant will be increased from 4100 to more than 7500 men. TRIB 2-28-40

5416 Employed Here In Aircraft Plants

UNION 2-28-40

A total of 5416 men and women are employed at the Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co. plants, officials announced yesterday.

Forty-one hundred are employed at Consolidated, 850 at Ryan and 466 at Solar.

Personnel of the Douglas Aircraft Co.'s factories at Santa Monica and El Segundo total 15,000, according to Carl A. Cover, general manager. The Douglas payroll last week was in excess of $440,000.

There are 11,700 employed at the Santa Monica plant and 3300 at El Segundo.

Cite Need For Trained Aircraft Workers at San Diego Factories

CONTACT FEB. 1940

Personnel Managers of Plane Plants Prepare To Meet Coming Demand

More than 3000 factory workers will have to be added to the payrolls of San Diego aircraft factories during the balance of the year in order to meet the heavy production schedules called for in filling the more than $50,000,000 in plane orders now on hand.

Such is the aircraft employment situation as outlined there recently at a meeting of personnel managers of the Consolidated, Ryan and Solar aircraft factories.

So that Southern California labor may be employed in preference to out-of-state workers, it will be necessary to train hundreds of skilled technicians during the coming months, according to Marvin Marco, employment manager of one of the local plants.

In order that competent, industry-recognized training may be available to those interested in factory employment, the long-established Ryan School of Aeronautics, San Diego, is now organizing special Sheet Metal classes designed specifically to equip local workers for factory employment in the shortest time consistent with proper training.

What of the Past—and the Future?

Recently CONTACT asked outstanding figures in the aeronautical industry the following questions:

1 What do you consider the greatest contribution to the progress of Aviation during the year 1939?

2 What is the biggest job confronting Aviation for the year 1940?

On this page appear the replies—a concensus of opinion representing a cross section of the industry—manufacturers, commercial airlines, airports, schools, etc.

Edgar N. Gott
Vice-President Consolidated Aircraft Corporation

San Diego, Calif.

It is the writer's personal opinion that the greatest contribution to progress of Aviation in 1939 was the successful operation by the Navy of its patrol planes on mass flights; and of the new flying boat bases established on both the Atlantic and Pacific oceans.

It is felt that the biggest problem for 1940 will be for the industry to fill the orders on hand without excessive plant expansion, which might later become idle.

BRITISH TO BUY MORE AIRCRAFT

Purchase of 10,000 Planes in U. S. During Next 18-Month Period Is Planned

Dow Jones News Service

WASHINGTON—British plans for the purchase of approximately 10,000 military airplanes in this country during the next 18 months were placed before United States Government officials recently, it was learned last night.

This figure is based upon British estimates of the amount of foreign help necessary in order to achieve air supremacy over Germany by the middle of 1941, it is understood.

As far as can be determined, it does not take into account the extent of possible French purchases here. In view of the coordination of the procurement agencies of the two Allies, however, it is thought that it will be increasingly difficult to draw a sharp distinction between their respective purchases.

British Output Near 1,000 Monthly

Plans to place orders in the United States for 10,000 planes during 1940 and the first half of 1941 were discussed informally with Washington authorities by a high ranking official of the British Empire who paid a brief visit here several weeks ago, it was learned. Apparently he went away satisfied.

Latest reports current in Washington are that British air production is now in the neighborhood of 1,000 planes a month. A number of new large factories are understood to be practically finished and equipped, and it is reported that when they get into production Great Britain will be equipped to turn out about 2,200 planes a month. Efforts to speed up French air factory schedules have been disappointing to the Allies, and French current production is reported to be still short of 300 a month.

Although accurate estimates, of course, are impossible to obtain, some Government officials believe that the current German air production is at the rate of about 2,000 planes a month. Combined British and French purchases in the United States since before the outbreak of the war are estimated at about 5,000 craft.

In the event of a large-scale German air offensive in the spring, which Prime Minister

"YANKEE"

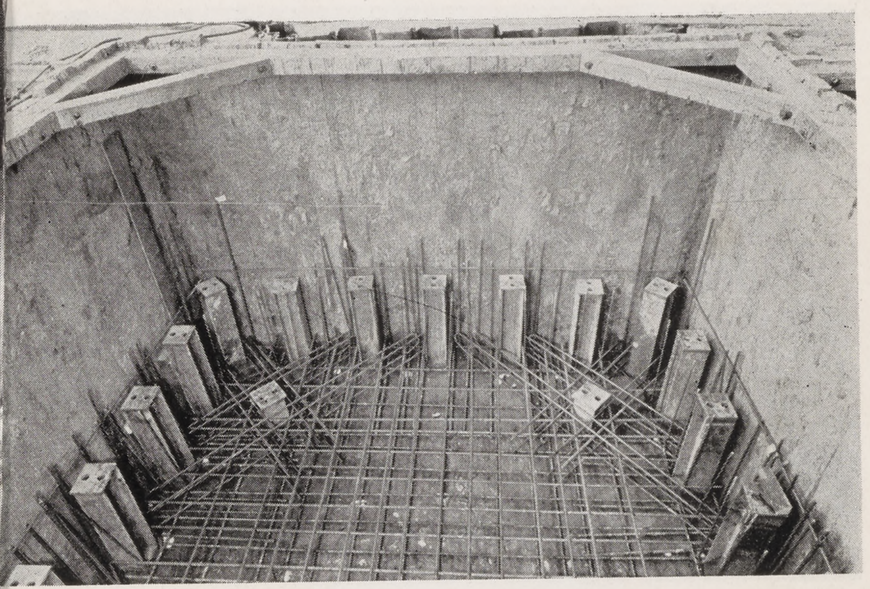
VISE and VISE CLAMP

"YANKEE" Vises and Vise Clamps are made to work together—for more accurate results in less time. "YANKEE" Vises are a real convenience in any shop. Work can be kept in alignment for a series of jobs. The clamp holds Vise rigidly for machining operations. Its long slotted body makes for quick and easy adjustment of work on Drill Press table. Vise illustrated available in four sizes: No. 991; 1½" jaw width. No. 992; 2" jaw width. No. 993; 2¾" jaw width. No. 994; 4" jaw width.

"Yankee" Vise Clamp made in two sizes only: Clamp No. 2992, length 9¾", for Vise No. 992. Clamp No. 2993, length 10½", for Vise No. 993.

"Yankee" Vise Clamp easily attaches "Yankee" Vise to face plate. Assures rigidity and accuracy, in holding work for drilling and machining operations

Order From Your Supply House. For "Yankee" Vise Circular, Write North Bros. Mfg. Co., Dept. MS, Philadelphia, U. S. A.



Bottom Reinforcements in Place, Ready for Pouring

The ultimate solution represented the best effort of three minds working in collaboration. "Floating power" was their solution—the same principle that is employed by automobile engineers in "floating power" plants on shock-absorbing mountings.

Having determined the principle they were to employ, they found themselves faced with a series of lesser puzzles. First, the land on which the hammers were to be mounted was hydraulic fill (reclaimed tideland) with a bearing value of only 1,250 lbs. per square foot. A series of tests indicated that they would have to go 50 feet or more for foundation, necessitating the use of pile foundations. A number of considerations, chief of which was the fact that the piles were to be driven indoors with only 30 feet clearance beneath the roof trusses, prompted the selection of steel "H" piles. Accordingly, the piles were driven in 20-ft. sections, and these sections were welded together.

The tremendous weight of the hammers contributed to the problem. Largest of these mechanical behemoths tips the scales at 101,000 lbs., and can carry punch and die weights up to 30,000 lbs. It has a platen area to accommodate dies of 96 x 48-inch, and exerts a maximum theoretical force on the foundations at moment of impact of approximately 1,060,000 lb. The medium-sized hammer, no toy itself, weighs about 65,000 lb., with a punch and die capacity of some 15,000 lb. and a platen area of 60 x 36-inch. At moment of impact, under maximum conditions, it exerts a theoretical force of 405,000 lb. The two smaller Chambersburgs total 33,000 lb. apiece; each accommodates punch and die weights of about 10,000 lb., with platen areas of 41 x 36-inch. The theoretical maximum force developed by these ham-

Consair Steel For Buildings On Way Here

UNION 3/8/40

Fabricated steel for new buildings soon to be constructed at the Consolidated Aircraft Co.'s plant is included in the cargo of the American Hawaiian freighter American due Thursday from Philadelphia.

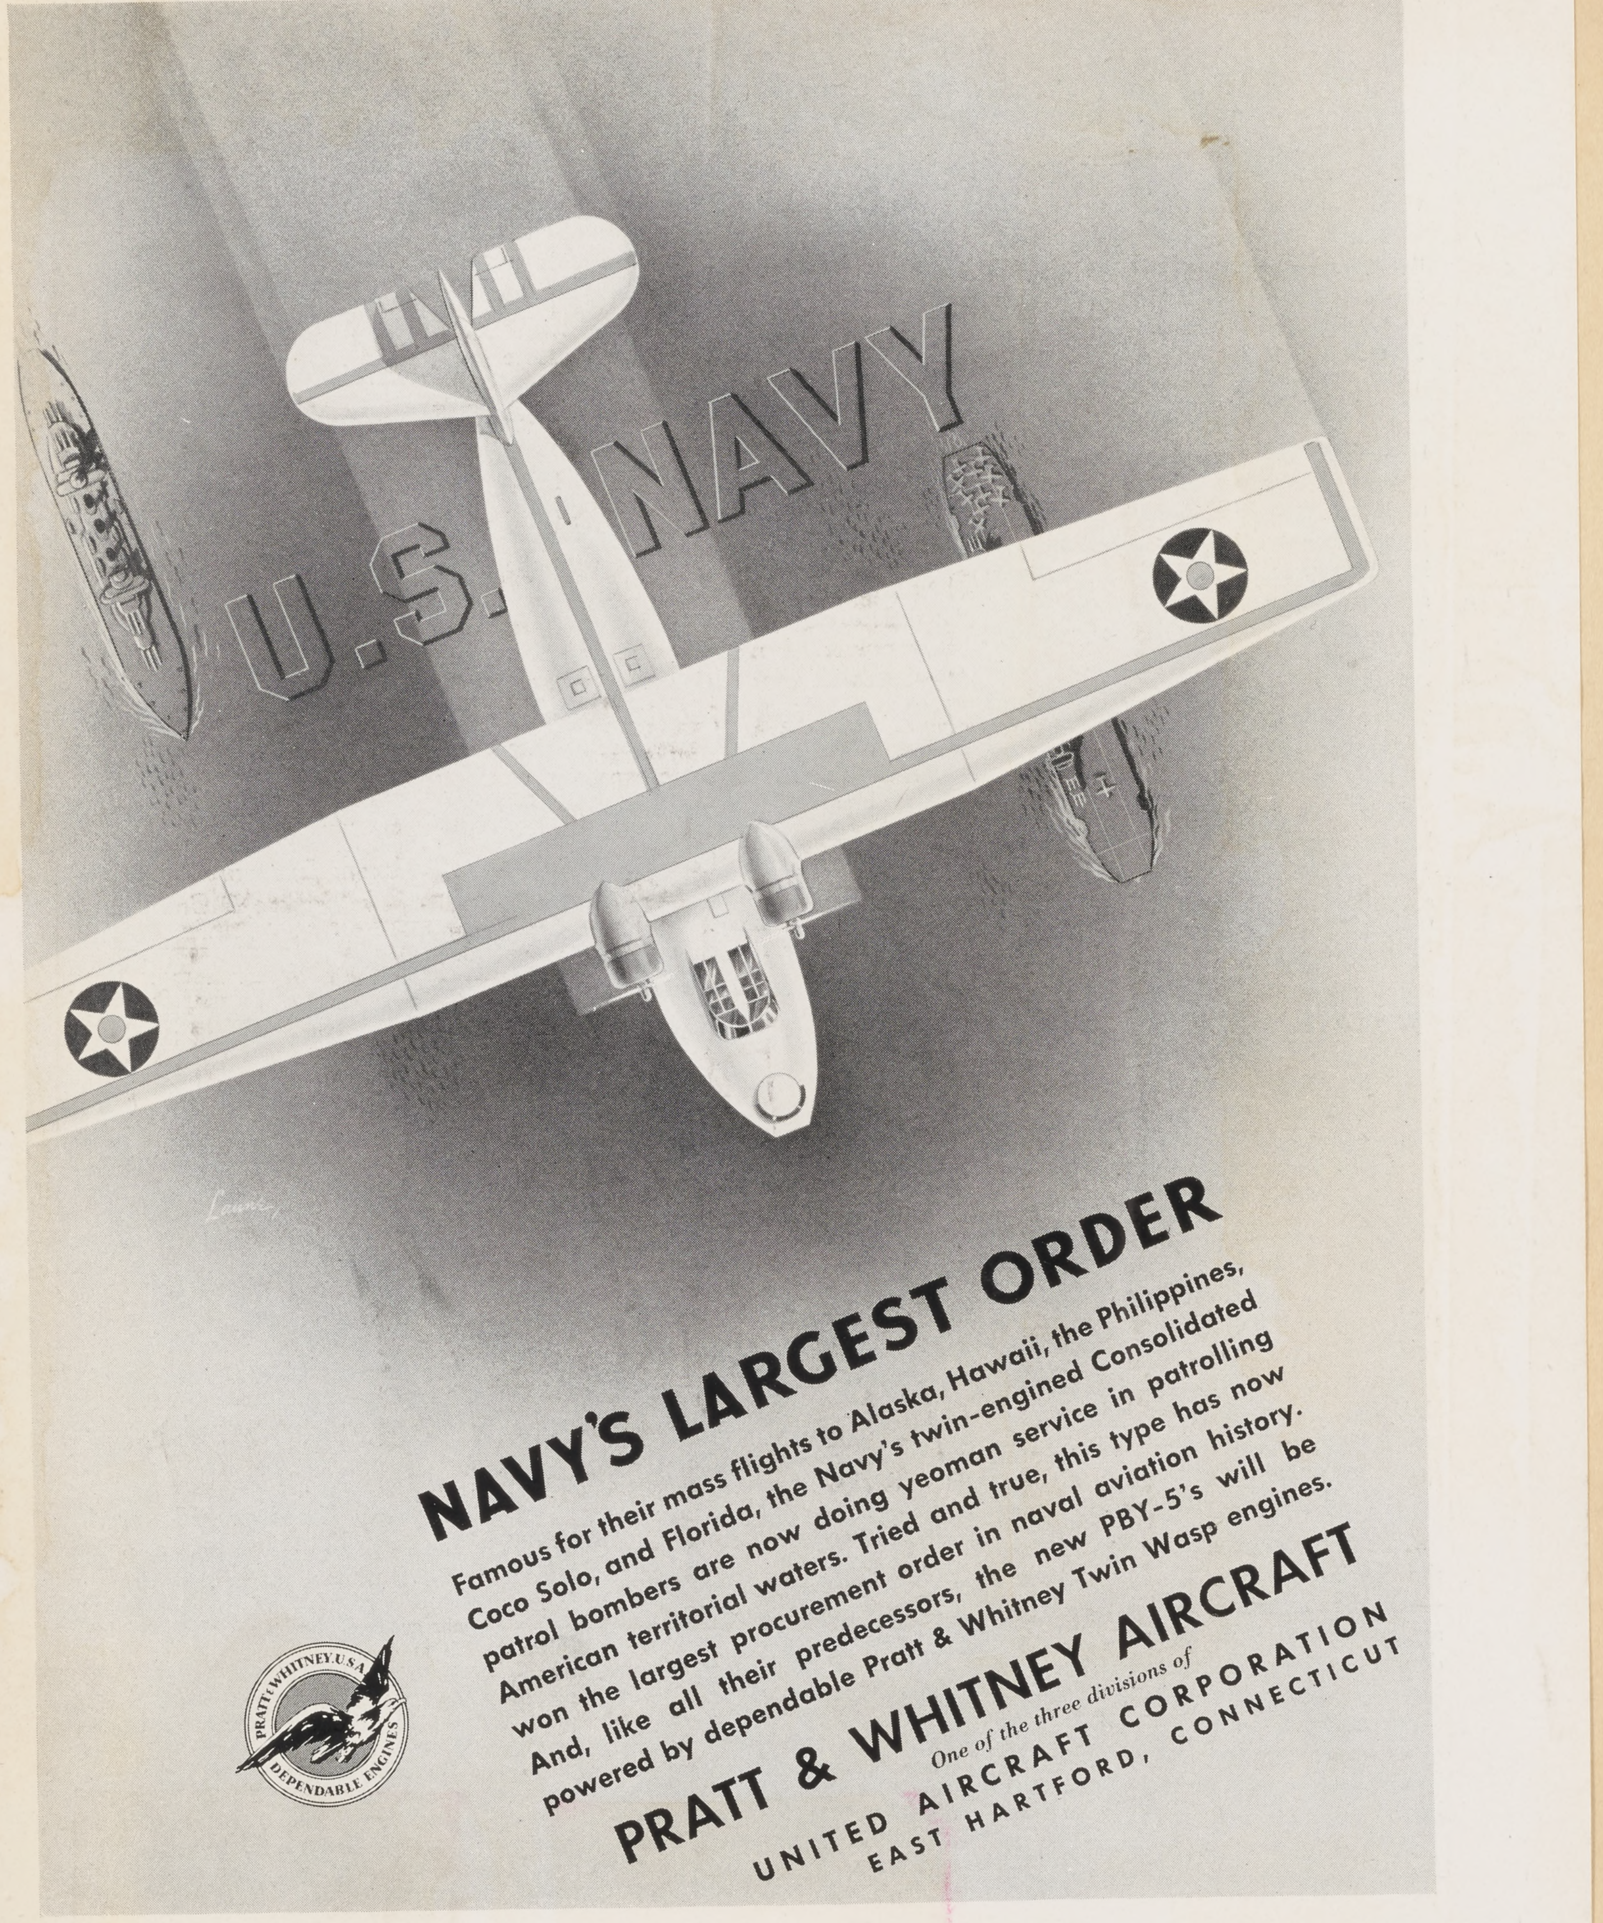
The American is one of a fleet of eight intercoastal vessels to call here in the next three weeks, all of them laden to the plimsoll mark.

Aircraft Firms Seen By Metallurgist

TRIB 3/7/40

Dr. E. H. Dix jr., chief metallurgist of the Aluminum Co. of America, today visited the Consolidated, Ryan and Solar Aircraft factories, conferring with officials at the plants on the latest developments in aluminum, used in the manufacture of planes because of its lightness. Accompanying Dix were M. J. Moffett, southern California district representative; W. C. Lynch, Los Angeles manager, and C. Pyne Frederick, sales manager, Pittsburgh, Pa.

This evening Dix will be honor guest at a dinner at the San Diego hotel, at which Consolidated representatives, T. Claude Ryan, head of the Ryan Co., and Edmund T. Price, Solar head, will attend. Others at the dinner will be Maj. Edwin R. McReynolds, army air corps aircraft factory representative, and Comdr. R. G. Mayer, navy representative. Following the dinner, a closed meeting will be held at the chamber of commerce, at which Dix will show pictures and lecture on the latest aluminum developments.



NAVY'S LARGEST ORDER

Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

Consair Gets Permit For $1,050,000 Unit

San Diego's biggest single building permit in almost 15 years was issued yesterday when Consolidated Aircraft Corp., was granted a permit to build their $1,050,000 plant addition.

Recalling big permits of the past, Oscar Knecht, city building inspector, said last night that the permit for building the Civic Center totaled more, but was taken out in two parts. Last one of that size, he recalled, was about 1926 when the San Diego Trust and Savings Bank building was constructed.

The Consolidated permit calls for erection of six steel and sheet metal buildings which will house factory and office space and provide additional store room.

Issuance of the permit brought the year's total for the city to $2,741,579, compared to $1,068,963 for the same period last year.

$1,050,000 ADDED TO PERMIT TOTAL BY CONSOLIDATED

Preparatory to doubling their output and workers' staff, Consolidated Aircraft Co. today was issued a permit authorizing construction of six new manufacturing and assembly buildings, cost of which is estimated at $1,050,000.

Issuance of the building permit swelled the month's permits to $1,600,523 as compared with $451,766 of a year ago and raised the year's total to $2,741,579, more than double last year's figure of $1,039, 54.

The permit issued today provides for construction of six steel and sheet metal buildings, according to Oscar Knecht, city building inspector, plans for all of which were drafted by Architect Edward Cray Taylor. All are to be built under direction of Ellis Wing Taylor, contractor.

The structures contemplated, several of which are now under construction, include one assembly plant, 50 by 125 feet; a manufacturing building, 300 to 720 feet; another 120 by 240 feet; an office building, 50 by 200 feet; a boiler house, 50 by 100 feet, and a material and store building, 30 by 1000 feet.

Work already is under way on two of the structures and will be pushed as rapidly as possible to allow work of construction on a number of new planes, contracts for which have been awarded by the army and navy departments.

It is estimated that with completion of the new buildings the working staff at the plant will be increased from 4100 to more than 7500 men.

5416 Employed Here In Aircraft Plants

UNION 2-28-40

A total of 5416 men and women are employed at the Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co. plants, officials announced yesterday.

Forty-one hundred are employed at Consolidated, 850 at Ryan and 466 at Solar.

Personnel of the Douglas Aircraft Co.'s factories at Santa Monica and El Segundo total 15,000, according to Carl A. Cover, general manager. The Douglas payroll last week was in excess of $440,000.

There are 11,700 employed at the Santa Monica plant and 3300 at El Segundo.

Cite Need For Trained Aircraft Workers at San Diego Factories

CONTACT FEB. 1940

Personnel Managers of Plane Plants Prepare To Meet Coming Demand

More than 3000 factory workers will have to be added to the payrolls of San Diego aircraft factories during the balance of the year in order to meet the heavy production schedules called for in filling the more than $50,000,000 in plane orders now on hand.

Such is the aircraft employment situation as outlined there recently at a meeting of personnel managers of the Consolidated, Ryan and Solar aircraft factories.

So that Southern California labor may be employed in preference to out-of-state workers, it will be necessary to train hundreds of skilled technicians during the coming months, according to Marvin Marco, employment manager of one of the local plants.

In order that competent, industry-recognized training may be available to those interested in factory employment, the long-established Ryan School of Aeronautics, San Diego, is now organizing special Sheet Metal classes designed specifically to equip local workers for factory employment in the shortest time consistent with proper training.

Complete in scope, the new Ryan sheet metal course offers 200 hours of technical training in blue print reading, metallurgy, layout and patterns, riveting, assembly, forming, drilling, filing and bumping. Lasting five weeks, the training is given eight hours a day, Monday through Friday.

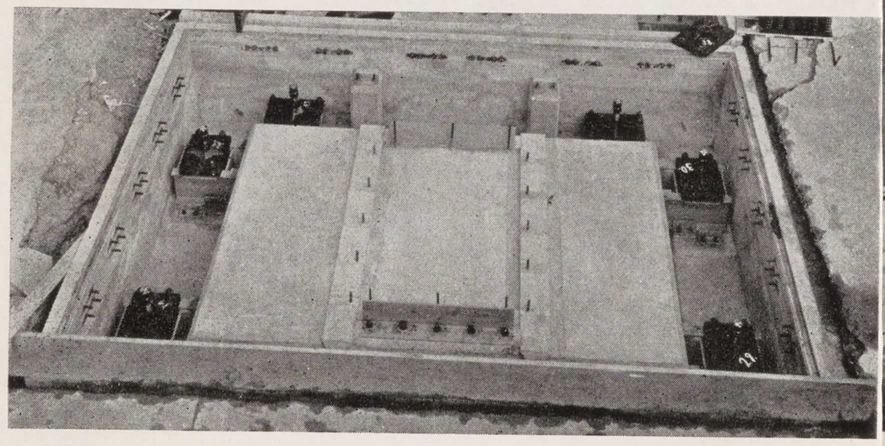
Forming Shell for Drop Hammer Foundation

mers equals 275,000 pounds.

With the steel H-beams down and welded, the engineers turned to the problem of inertia blocks, which were to serve as mountings for the hammers. If poured of concrete alone, they determined, the blocks would of necessity be too large, the normal density of concrete being but 150 lb. per cubic foot. So, adding



Drop Hammer Foundation with Inertia Block Completed

eel boiler punchings to the mixture stead of using rock alone, they in- eased the density of the concrete 224 lb. per cubic foot, very neatly creasing mass and decreasing vol- me in the same operation. Consoli- ated Aircraft is possibly the first to se boiler punchings in this unique anner, and probably the first to in- all such extensive vibration-isola- on equipment.

The mixture determined, the iner- a blocks were poured in sections. oncrete foundation boxes having een prepared to receive the blocks, pper pans two feet deep were aced on the bottoms of these boxes, d the first two feet of the blocks ured into them. The remainder of e concrete was then poured into slip forms. Steel cross-beams were embedded in the blocks, and allowed to project. These arms served to suspend the blocks within the foundation boxes, and rest on Korfund coil springs, which in turn rested on the concrete pit walls carried by the steel piles. The inertia blocks were poured in the "down" position and were then raised, to clear the bottom of the pits 2¼ inch by compressing the supporting springs.

In operation these blocks, each with a hammer aboard, "float" on springs. Average deflection of the springs under impact approximates one-quarter inch. The normal weight of the hammers deflects the springs about 0.71 inch. Houdaille shock absorbers are used in connection with

Sales Gain 50% Over 1938

Sales by these 15 companies during 1939 approximated $238,000,000, a gain of 50% over the $158,000,000 reported for 1938.

Earnings, however, did not show as large a gain as might be expected from such a sharp rise in sales volume, the total being estimated at $28,000,000 for the past year as compared with $17,749,456 for 1938. This gain in profits of 58% was distorted somewhat by the large loss experienced by Boeing which made

Consair Steel For Buildings On Way Here

UNION 3/8/40

Fabricated steel for new buildings soon to be constructed at the Consolidated Aircraft Co.'s plant is included in the cargo of the American Hawaiian freighter American due Thursday from Philadelphia.

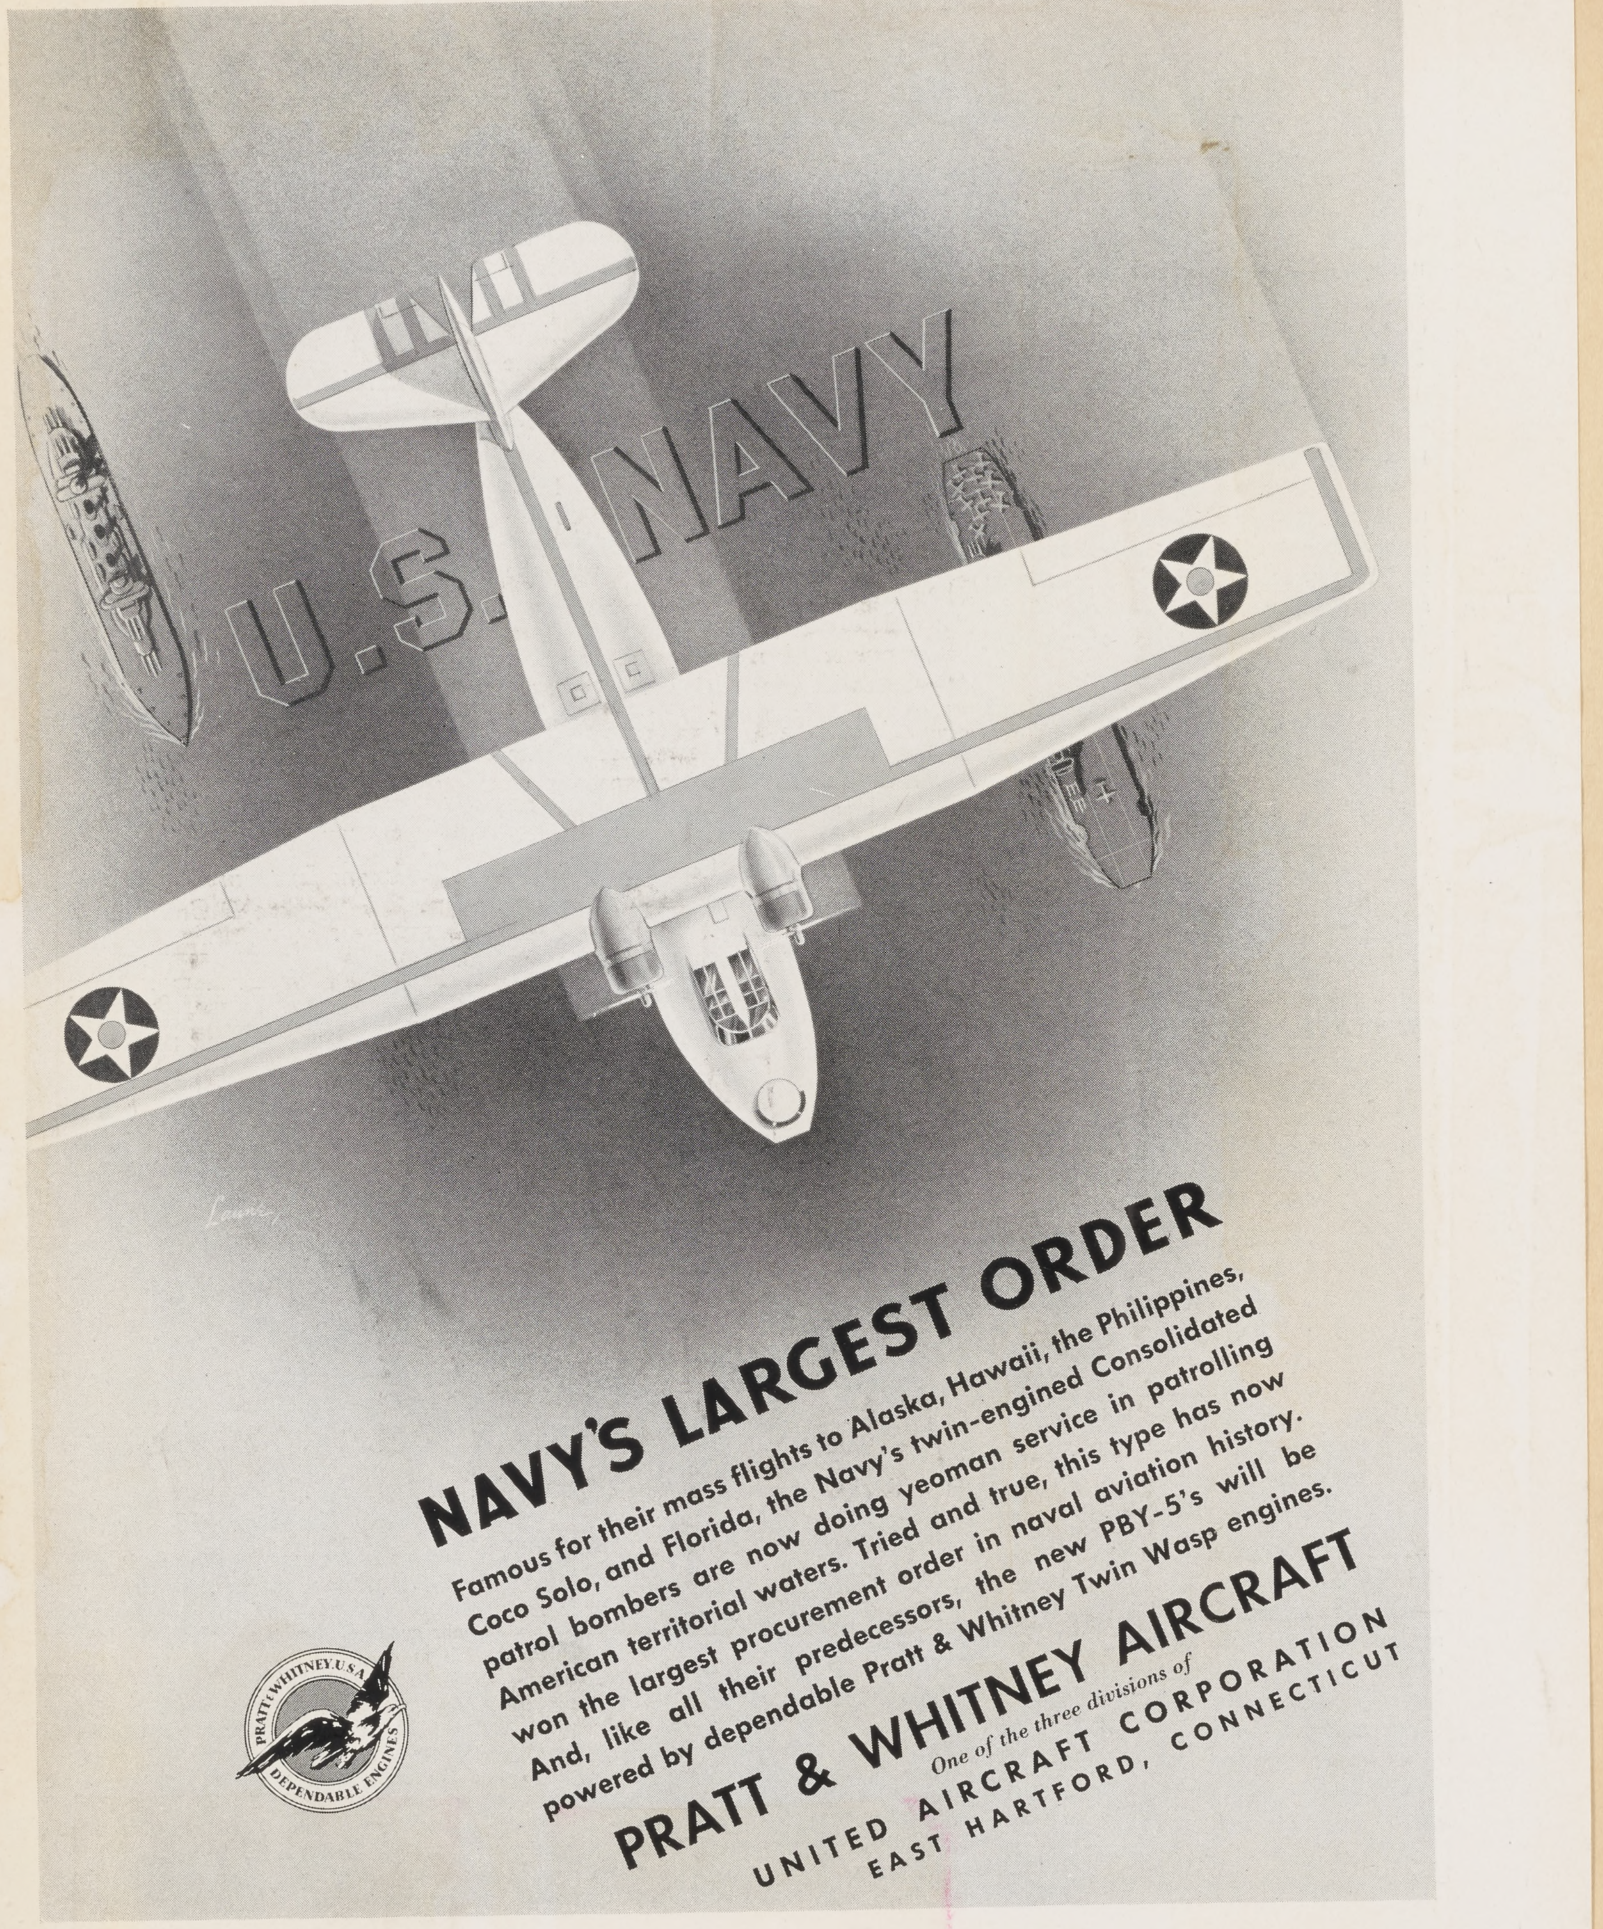
The American is one of a fleet of eight intercoastal vessels to call here in the next three weeks, all of them laden to the plimsoll mark.

Aircraft Firms Seen By Metallurgist

TRIB 3/7/40

Dr. E. H. Dix jr., chief metallurgist of the Aluminum Co. of America, today visited the Consolidated, Ryan and Solar Aircraft factories, conferring with officials at the plants on the latest developments in aluminum, used in the manufacture of planes because of its lightness. Accompanying Dix were M. J. Moffett, southern California district representative; W. C. Lynch, Los Angeles manager, and C. Pyne Frederick, sales manager, Pittsburgh, Pa.

This evening Dix will be honor guest at a dinner at the San Diego hotel, at which Consolidated representatives, T. Claude Ryan, head of the Ryan Co., and Edmund T. Price, Solar head, will attend. Others at the dinner will be Maj. Edwin R. McReynolds, army air corps aircraft factory representative, and Comdr. R. G. Mayer, navy representative. Following the dinner, a closed meeting will be held at the chamber of commerce, at which Dix will show pictures and lecture on the latest aluminum developments.



NAVY'S LARGEST ORDER

Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

Consair Gets Permit For $1,050,000 Unit

San Diego's biggest single building permit in almost 15 years was issued yesterday when Consolidated Aircraft Corp., was granted a permit to build their $1,050,000 plant addition.

Recalling big permits of the past, Oscar Knecht, city building inspector, said last night that the permit for building the Civic Center totaled more, but was taken out in two parts. Last one of that size, he recalled, was about 1926 when the San Diego Trust and Savings Bank building was constructed.

The Consolidated permit calls for erection of six steel and sheet metal buildings which will house factory and office space and provide additional store room.

Issuance of the permit brought the year's total for the city to $2,741,579, compared to $1,068,963 for the same period last year.

$1,050,000 ADDED TO PERMIT TOTAL BY CONSOLIDATED

Preparatory to doubling their output and workers' staff, Consolidated Aircraft Co. today was issued a permit authorizing construction of six new manufacturing and assembly buildings, cost of which is estimated at $1,050,000.

Issuance of the building permit swelled the month's permits to $1,600,523 as compared with $451,766 of a year ago and raised the year's total to $2,741,579, more than double last year's figure of $1,039, 54.

The permit issued today provides for construction of six steel and sheet metal buildings, according to Oscar Knecht, city building inspector, plans for all of which were drafted by Architect Edward Cray Taylor. All are to be built under direction of Ellis Wing Taylor, contractor.

The structures contemplated, several of which are now under construction, include one assembly plant, 50 by 125 feet; a manufacturing building, 300 to 720 feet; another 120 by 240 feet; an office building, 50 by 200 feet; a boiler house, 50 by 100 feet, and a material and store building, 30 by 1000 feet.

Work already is under way on two of the structures and will be pushed as rapidly as possible to allow work of construction on a number of new planes, contracts for which have been awarded by the army and navy departments.

It is estimated that with completion of the new buildings the working staff at the plant will be increased from 4100 to more than 7500 men. TRIB 2-28-40

5416 Employed Here In Aircraft Plants

UNION 2-28-40

A total of 5416 men and women are employed at the Consolidated Aircraft Corp., Ryan Aeronautical Co. and Solar Aircraft Co. plants, officials announced yesterday.

Forty-one hundred are employed at Consolidated, 850 at Ryan and 466 at Solar.

Personnel of the Douglas Aircraft Co.'s factories at Santa Monica and El Segundo total 15,000, according to Carl A. Cover, general manager. The Douglas payroll last week was in excess of $440,000.

There are 11,700 employed at the Santa Monica plant and 3300 at El Segundo.

Cite Need For Trained Aircraft Workers at San Diego Factories

CONTACT FEB. 1940

Personnel Managers of Plane Plants Prepare To Meet Coming Demand

More than 3000 factory workers will have to be added to the payrolls of San Diego aircraft factories during the balance of the year in order to meet the heavy production schedules called for in filling the more than $50,000,000 in plane orders now on hand.

Such is the aircraft employment situation as outlined there recently at a meeting of personnel managers of the Consolidated, Ryan and Solar aircraft factories.

So that Southern California labor may be employed in preference to out-of-state workers, it will be necessary to train hundreds of skilled technicians during the coming months, according to Marvin Marco, employment manager of one of the local plants.

In order that competent, industry-recognized training may be available to those interested in factory employment, the long-established Ryan School of Aeronautics, San Diego, is now organizing special Sheet Metal classes designed specifically to equip local workers for factory employment in the shortest time consistent with proper training.

Complete in scope, the new Ryan sheet metal course offers 200 hours of technical training in blue print reading, metallurgy, layout and patterns, riveting, assembly, forming, drilling, filing and bumping. Lasting five weeks, the training is given eight hours a day, Monday through Friday.

What of the Past—and the Future?

Recently CONTACT asked outstanding figures in the aeronautical industry the following questions:

1 What do you consider the greatest contribution to the progress of Aviation during the year 1939?

2 What is the biggest job confronting Aviation for the year 1940?

On this page appear the replies—a concensus of opinion representing a cross section of the industry—manufacturers, commercial airlines, airports, schools, etc.

Edgar N. Gott
Vice-President Consolidated Aircraft Corporation

San Diego, Calif.

It is the writer's personal opinion that the greatest contribution to progress of Aviation in 1939 was the successful operation by the Navy of its patrol planes on mass flights; and of the new flying boat bases established on both the Atlantic and Pacific oceans.

It is felt that the biggest problem for 1940 will be for the industry to fill the orders on hand without excessive plant expansion, which might later become idle.

JAN 10 1940

BRITISH TO BUY MORE AIRCRAFT

Purchase of 10,000 Planes in U. S. During Next 18-Month Period Is Planned

Dow Jones News Service

WASHINGTON—British plans for the purchase of approximately 10,000 military airplanes in this country during the next 18 months were placed before United States Government officials recently, it was learned last night.

This figure is based upon British estimates of the amount of foreign help necessary in order to achieve air supremacy over Germany by the middle of 1941, it is understood.

As far as can be determined, it does not take into account the extent of possible French purchases here. In view of the coordination of the procurement agencies of the two Allies, however, it is thought that it will be increasingly difficult to draw a sharp distinction between their respective purchases.

British Output Near 1,000 Monthly

Plans to place orders in the United States for 10,000 planes during 1940 and the first half of 1941 were discussed informally with Washington authorities by a high ranking official of the British Empire who paid a brief visit here several weeks ago, it was learned. Apparently he went away satisfied.

Latest reports current in Washington are that British air production is now in the neighborhood of 1,000 planes a month. A number of new large factories are understood to be practically finished and equipped, and it is reported that when they get into production Great Britain will be equipped to turn out about 2,200 planes a month. Efforts to speed up French air factory schedules have been disappointing to the Allies, and French current production is reported to be still short of 300 a month.

Although accurate estimates, of course, are impossible to obtain, some Government officials believe that the current German air production is at the rate of about 2,000 planes a month. Combined British and French purchases in the United States since before the outbreak of the war are estimated at about 5,000 craft.

Consair Backlog 49 Millions; Working 3 Shifts

A backlog of $49,000,000 which will keep the plant busy until the midsummer of 1941 is listed by R. H. Fleet, president of Consolidated Aircraft Corp., in the company's annual report to be made public today.

"Our employes number 4300, we are adding about 100 men a week and are operating three shifts," Fleet reported to stockholders. "Since organization in 1923 we have constructed more than three times as many airplanes with a wing span of 100 feet or over than all other airplane manufacturers combined and are the largest builders of flying boats in the world."

He reported net earnings of $1,104,327 for 1939, equivalent to $1.79 a share on common stock and $3 on preferred. The directors decided against declaring a common stock dividend.

$49,000,000 In Unfilled Consair Orders

The annual report of the Consolidated Aircraft Corp., released today, reveals that the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 backlog previously announced.

Consair officials refused to comment on the $9,000,000 in additional orders, but it was learned authoritatively that they were placed by a foreign nation or nations.

It was explained by a company spokesman that there was nothing secretive about the orders but that,

(Continued on Page 4A, Col. 2)

$49,000,000 Total Of Consair Orders

CONTINUED FROM PAGE ONE

as a matter of policy, Consair officials felt that any announcement of the deal should be made by the customer or customers.

In line with naval and military restrictions, Consolidated refused to specify what kind of planes or how many were covered by the orders or to name the date that they will be delivered.

Adding 100 Weekly

R. H. Fleet, Consair president, in the annual statement said: "Our employes number 4300, we are adding about 100 men a week and are operating in three shifts.

"Since organization in 1923, we have constructed more than three times as many airplanes with a wing span of 100 feet or over as all other airplane manufacturers combined and are the largest builders of flying boats in the world."

Reported were net earnings of $1,104,327 for 1939, equivalent to $1.79 a share on common stock and $3 on preferred. Directors passed a common stock dividend.

Weihmiller Resigns

Consolidated Aircraft Corp. announces resignation of H. E. Weihmiller as of Feb. 29. Weihmiller, elected a vice president in December, 1937, formerly had charge of Consolidated's Washington office as its eastern representative.

U. S. NAVAL INSTITUTE PROCEEDINGS - JAN - 1940.

SECRETARY'S NOTES

Flag Plane On August 24, 1939, the 4-engined flying boat XPB2Y-1 became the first airplane to be officially recognized as a flagplane of the United States Navy. On that date, Rear Admiral A. B. Cook, commanding the Aircraft Squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the U.S.S. *Memphis* at Seattle, and hoisted it aboard the XPB2Y-1. Thereby was established a precedent in naval history. Never before had such a flag been officially hoisted on an airplane. The huge plane, by formal procedure, thus became the first flagplane ever to fly for the U. S. Navy—a signal honor. It had been flown to Seattle by navy personnel commanded by Commander Andrew Crinkley.

Commander Crinkley and his crew, in October of 1938, flew the XPB2Y-1, while still fitted with experimental apparatus and equipment, on a precedent setting flight completely across the United States. The XPB2Y-1 is a flying boat, yet the flight was made entirely over land, expressing confidence in the smooth functioning of the ship. The flight was nonstop from the waters of San Diego Bay, northward over spectacular mountain terrain via Salt Lake City and thence due east to Anacostia (Washington, D. C.). At this destination, the airplane was personally inspected by President Roosevelt. Flight time 13 hours. Very cold weather, darkness over much of the route, tail winds and a closing in fog at Anacostia marked this outstanding transcontinental flight. The return to San Diego, a few days later, was likewise cross-continent, and nonstop-this time by a southern route and against head winds of considerable magnitude, which were met without difficulty.

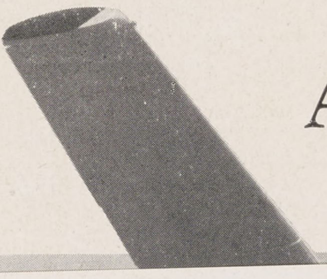
The casual manner in which these flights were accomplished was expressed by Commander Crinkley soon after the ship's return:

> This flight was made in all respects in a routine operation manner and no special consideration or preparation was necessary in its accomplishment. Upon our return to San Diego the crew felt confident that the ship could have been refueled and departed for Honolulu or any other point immediately.

This double spanning of the continent together with the recent honor of becoming the first official flagplane, in retrospect, may, be seen as of striking potentiality. Such a performance could easily have been one for transporting the commanding officers and members of their staff, with lightning speed, to positions thousands of miles away, even though the naval destinations might be separated by a whole continent. An official flagplane thus appears to have in it latent usage of a very wide nature.

Aeronautics (London)
Jan. 1940

AMERICAN MEDLEY



lifferent kinds of gas.

Professor J. B. S. Haldane said a ittle time ago that theoretically it was ınlikely that any new explosive would emerge in this war. David Dale Logan, writing in this book, is more precise. He deals with the use of oxygen and iquid air, both of which have been alleged n the daily papers to form entirely new German explosives.

Nitro-glycerine, he says, which was discovered in 1846, still remains the most powerful high explosive. The large number of new explosives used during the earlier war and others which have appeared since are merely new mixtures of substances which have been used for many years. All the powers at war with the exception of Germany used practically the same types of explosive. During the latter months of the war of 1914-18 the Germans used liquid air very extensively as an explosive for demolition work and for blasting operations for making dug-outs and tunnels. As for the liquid oxygen bombs which the Germans were said to have used in Spain, it will be recalled that the report

results from the detonations of high explosive bombs. Against this there seems to be no protection, and his accounts of the effects are of very great importance. Another writer in this book, Mr. E. M. Cowell, lists the various forms of gas that could be used in bombing and groups them in the order of their toxicity as (1) lacrimators (tear gas), (2) sternutators (nose irritants), (3) vesicants (blistering), (4) lung irritants, (5) paralysants, (6) gases met with accidentally, such as carbon monoxide. Mustard gas, according to this authority, could be spread from the air by low flying machines. The treatments for those who have suffered from gas attack are described in some detail and it is notable that for most of the gases the injuries are not fatal.

This book, although it is so largely concerned with purely medical matters, is one which all those who are interested in the attack possibilities of aerial bombing and aerial gas attack should study most closely. It is probably the most important statement of the possibilities that has yet appeared.

issued by Collins at 2s. This diary consists of 150 pages of informative tables and other matter and, so far as we have been able to check it, it is accurate.

"*Aero Engines*" (*Pitmans*, 3*s*. 6*d*). This is the sixth edition of a work which has already proved very valuable to ground engineers. It is intended for those who are studying to qualify for the Ground Engineer's "D" Licence.

"*Aircraft Identification*" (*The Aeroplane*, 1*s*.). A booklet of 32 pages containing photographs and silhouettes of German and Allied aeroplanes. With the pictures there are brief statements of the facts relating to each type of machine. There has been lately a very widespread demand for aircraft recognition matter and we recommend this booklet on account of its accuracy and excellent layout. It should provide all the necessary information for such people as anti-aircraft gunners and members of the Observer Corps.

Funeral at Arlington

LEWIS A. YANCEY

TRIB 5/3/40

GUBA PILOT DEAD; IN ILL HEALTH SEVERAL MONTHS

Lewis A. Yancey, 44, famous flier, who died Sunday at Yonkers, N. Y., was well-known in San Diego. His most recent air exploit was acting as navigator on the New Guinea-round-the-world flight of the "Guba," Consolidated-built plane owned by Richard Archbold, scientist.

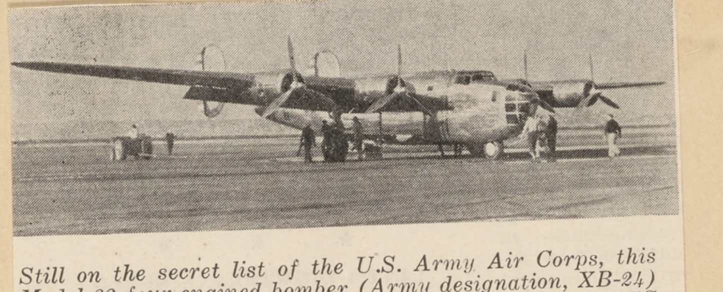
Yancey was a navy flier for 13 years before he made his trans-atlantic flight in 1929 with Roger Q. Williams in their plane, the "Pathfinder," which landed at Littorio airport, Rome, July 10, 1929, after a flight from Old Orchard, Me., via Santander, Spain. For this flight they received Italy's gold medal for aeronautics, presented to them by Gen. Italo Balbo, Italian flier, as 20,000 spectators in Rome watched. Before returning to the United States the two were received in private audience by the pope.

Autogiro Pilot

Three years later Yancey came to San Diego, piloting an autogiro, in which he had flown to Mexico and Cuba, first plane of its kind to visit those countries. He gave several demonstrations with the craft at Lindbergh field, March 20, 1932. In flying from Havana to Merida, Yucatan, Yancey established a new long-distance flight record for autogiros, flying 500 miles. He was said to have been the only pilot ever to loop an autogiro.

Yancey and other members of the crew of the "Guba" brought Archbold's plane to San Diego last July 6 at the end of the flying boat's round-the-world flight.

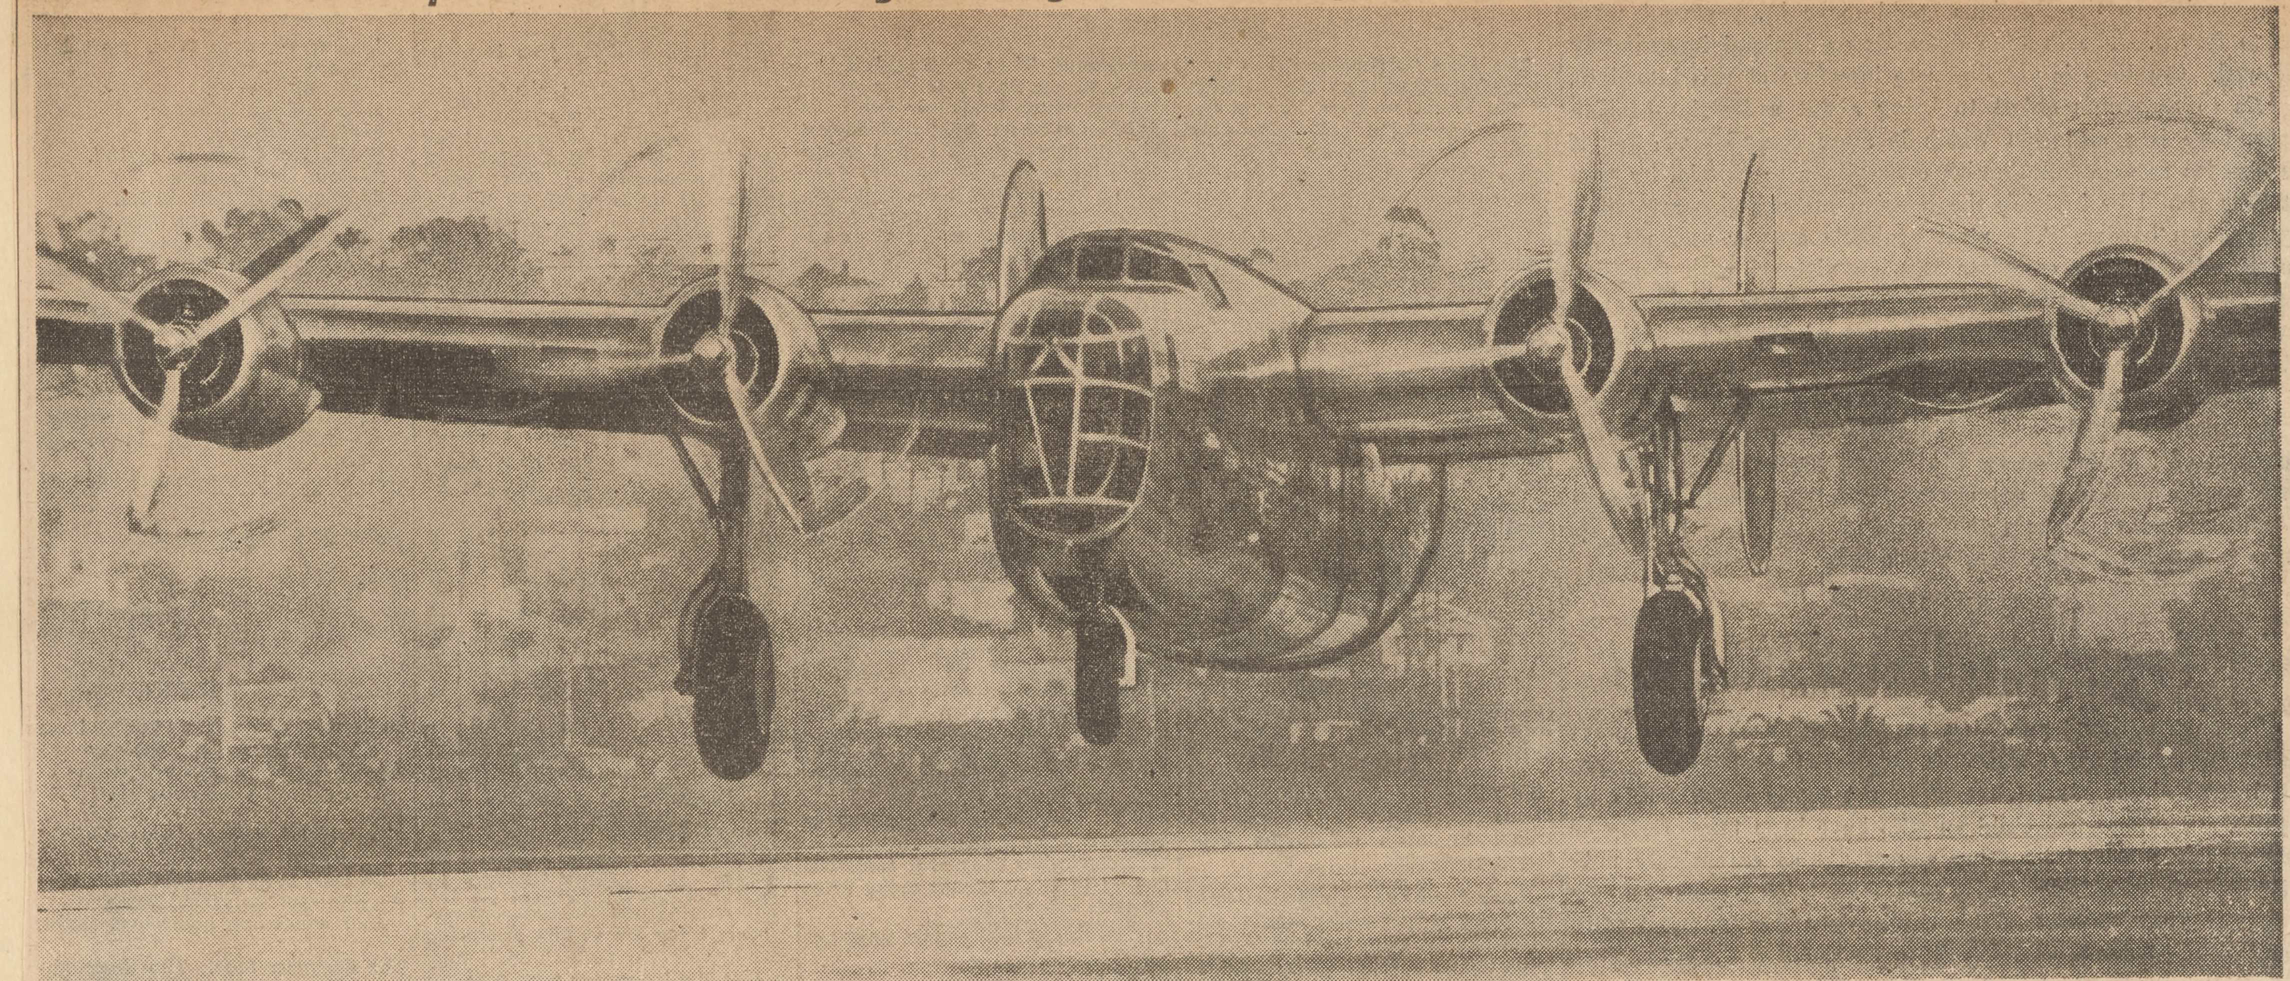
The flier was a native of Chicago. His death, according to The International News Service, was caused by a cerebral hemorrhage. He had been in ill health for several months. Funeral services were set for today at Arlington national cemetery.



Still on the secret list of the U.S. Army Air Corps, this Model 32 four-engined bomber (Army designation, XB-24) is CONSOLIDATED AIRCRAFT CORPORATION'S latest product. Powered by PRATT and WHITNEY 18-cylinder Double Wasp A6-G series engines, each of 1,850 h.p. for take-off, this huge craft has an approximate gross weight of 40,000 lbs., length of 64 feet, span of 110 feet, and height of 19 feet. Its crew numbers from 6 to 9 members. The aircraft is of all-metal construction, has a speed greater than 300 m.p.h., range of 3,000 miles, and bomb-load of four tons. Fifty of these craft were in the order for 1,400 warplanes placed by the Allied Purchasing Mission on May 14. This picture was taken at Lindbergh Field, San Diego (California), as the big fellow was being towed out preparatory to a test-flight. Most people know CONSOLIDATED'S name and reputation in connection with flying-boats, and it comes as quite a piece of news to learn of such a big land-plane emanating from their workshops.

AIRLOG--May 1940

Nose-On View of Army's Newest 'Air Dreadnaught' Taking Off on Test Hop; Craft Built at Consolidated Plant Here



XB-24, the United States army air corp's new bombardment plane built at Consolidated Aircraft Corp., is shown here during initial test flights in this area. The four-motored, high-wing, all metal plane is powered by four Pratt & Whitney 18-cylinder, twin-row radial air-cooled engines, rated at 1200 horsepower each. Weighing approximately 40,000 pounds, the craft has a wing span of 110 feet. It is 64 feet in length and has an overall height of 19 feet. It carries a crew of from six to nine. Speed is estimated at more than 300 miles an hour. The cruising range is approximately 3000 miles and the bomb-carrying capacity is approximately four tons.—(Photo by Harry T. Bishop.)

AIRCRAFT CONCERN CLEARS $1,104,327

Net Income of Consolidated Company in 1939 Equal to $1.79 a Common Share

WON HUGE NAVY CONTRACT

Order Calls for $20,016,700 of Flying Boats—Backlog of Business $49,000,000

The annual report of the Consolidated Aircraft Corporation for 1939 shows a net profit of $1,104,327, equal to $1.79 a share on 576,160 common shares, after preferred dividends, compared to $1,535,110, or $2.55 a share, earned in 1938.

Products valued at $3,603,240 were delivered and billed, compared to $12,245,067 in 1938. New orders amounting to $42,948,053 were received, and unfilled orders at Dec. 31 were $42,141,694. Deliveries last year were relatively low, according to R. H. Fleet, president, because of the large amount of new aircraft design and development work and tooling for deliveries in 1940 and 1941.

In December, 1939, the company received an order from the United States Navy for $20,016,700 of flying boats, which Mr. Fleet believes is the largest contract for airplanes ever awarded by the government. It will necessitate additions of $2,000,000 in new production facilities.

The backlog of business at the beginning of March of about $49,000,000, Mr. Fleet says, will keep the company busy until midsummer, 1941. Current assets at Dec. 31 were $7,607,620, including $3,080,267 cash, and current liabilities were $3,613,750. Earned surplus totaled $4,009,653.

The Patrol or Flying Boat

There is another and very important aircraft type employed by the Navy, and that is the patrol or flying boat. This type is more widely known to the layman than either the carrier or combatant ship-based aircraft because of the many long distance mass flights it has successfully carried out and because of the commercial versions flying on transoceanic schedules.

These planes possess a high degree of mobility in themselves and are the largest type used by the Navy. They are capable of operating over great distances at sea, of being powerful offensively and defensively, of being self-sustaining to a large de-

(Continued on page 49)

Naval Aviation

(Continued from page 17)

gree, and of independently joining the Fleet at a given time and place, ready to take part in whatever action may be required.

The bases for these flying boats are strategically located, are self-maintaining to act independently or to supplement the Fleet in time of emergency. From these bases the complements of patrol planes are capable of scouting hundreds of miles at sea, carrying heavy bombs to attack any enemy vessel sighted, patrolling the oceans in advance of the Fleet, and patrolling the coastal sea lanes against attack on merchant vessels by enemy submarines and cruisers. The range of these planes and their efficiency may be greatly extended by the employment of surface ships of the tender class. With tenders, the corresponding number of planes, that is, about twenty to a tender, have greatly increased mobility, since the tender can seek sheltered waters and there provide the aircraft with the fuel and services necessary to sustained operations.

Consair Backlog 49 Millions; Working 3 Shifts

A backlog of $49,000,000 which will keep the plant busy until the midsummer of 1941 is listed by R. H. Fleet, president of Consolidated Aircraft Corp., in the company's annual report to be made public today.

"Our employes number 4300, we are adding about 100 men a week and are operating three shifts," Fleet reported to stockholders. "Since organization in 1923 we have constructed more than three times as many airplanes with a wing span of 100 feet or over than all other airplane manufacturers combined and are the largest builders of flying boats in the world."

He reported net earnings of $1,104,327 for 1939, equivalent to $1.79 a share on common stock and $3 on preferred. The directors decided against declaring a common stock dividend.

$49,000,000 In Unfilled Consair Orders

TRIB 3/6/40

The annual report of the Consolidated Aircraft Corp., released today, reveals that the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 backlog previously announced.

Consair officials refused to comment on the $9,000,000 in additional orders, but it was learned authoritatively that they were placed by a foreign nation or nations.

It was explained by a company spokesman that there was nothing secretive about the orders but that,

(Continued on Page 4A, Col. 2)

$49,000,000 Total Of Consair Orders

CONTINUED FROM PAGE ONE

as a matter of policy, Consair officials felt that any announcement of the deal should be made by the customer or customers.

In line with naval and military restrictions, Consolidated refused to specify what kind of planes or how many were covered by the orders or to name the date that they will be delivered.

Adding 100 Weekly

R. H. Fleet, Consair president, in the annual statement said: "Our employes number 4300, we are adding about 100 men a week and are operating in three shifts.

"Since organization in 1923, we have constructed more than three times as many airplanes with a wing span of 100 feet or over as all other airplane manufacturers combined and are the largest builders of flying boats in the world."

Reported were net earnings of $1,104,327 for 1939, equivalent to $1.79 a share on common stock and $3 on preferred. Directors passed a common stock dividend.

Weihmiller Resigns

Consolidated Aircraft Corp. announces resignation of H. E. Weihmiller as of Feb. 29. Weihmiller, elected a vice president in December, 1937, formerly had charge of Consolidated's Washington office as its eastern representative.

U. S. Naval Institute Proceedings - Jan - 1940.

SECRETARY'S NOTES

Flag Plane On August 24, 1939, the 4-engined flying boat XPB2Y-1 became the first airplane to be officially recognized as a flagplane of the United States Navy. On that date, Rear Admiral A. B. Cook, commanding the Aircraft Squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the U.S.S. *Memphis* at Seattle, and hoisted it aboard the XPB2Y-1. Thereby was established a precedent in naval history. Never before had such a flag been officially hoisted on an airplane. The huge plane, by formal procedure, thus became the first flagplane ever to fly for the U. S. Navy—a signal honor. It had been flown to Seattle by navy personnel commanded by Commander Andrew Crinkley.

Commander Crinkley and his crew, in October of 1938, flew the XPB2Y-1, while still fitted with experimental apparatus and equipment, on a precedent setting flight completely across the United States. The XPB2Y-1 is a flying boat, yet the flight was made entirely over land, expressing confidence in the smooth functioning of the ship. The flight was nonstop from the waters of San Diego Bay, northward over spectacular mountain terrain via Salt Lake City and thence due east to Anacostia (Washington, D. C.). At this destination, the airplane was personally inspected by President Roosevelt. Flight time 13 hours. Very cold weather, darkness over much of the route, tail winds and a closing in fog at Anacostia marked this outstanding transcontinental flight. The return to San Diego, a few days later, was likewise cross-continent, and nonstop-this time by a southern route and against head winds of considerable magnitude, which were met without difficulty.

The casual manner in which these flights were accomplished was expressed by Commander Crinkley soon after the ship's return:

> This flight was made in all respects in a routine operation manner and no special consideration or preparation was necessary in its accomplishment. Upon our return to San Diego the crew felt confident that the ship could have been refueled and departed for Honolulu or any other point immediately.

This double spanning of the continent together with the recent honor of becoming the first official flagplane, in retrospect, may, be seen as of striking potentiality. Such a performance could easily have been one for transporting the commanding officers and members of their staff, with lightning speed, to positions thousands of miles away, even though the naval destinations might be separated by a whole continent. An official flagplane thus appears to have in it latent usage of a very wide nature.

Funeral at Arlington

LEWIS A. YANCEY

TRIB 5/3/40

GUBA PILOT DEAD; IN ILL HEALTH SEVERAL MONTHS

Lewis A. Yancey, 44, famous flier, who died Sunday at Yonkers, N. Y., was well-known in San Diego. His most recent air exploit was acting as navigator on the New Guinea-round-the-world flight of the "Guba," Consolidated-built plane owned by Richard Archbold, scientist.

Yancey was a navy flier for 13 years before he made his trans-atlantic flight in 1929 with Roger Q. Williams in their plane, the "Pathfinder," which landed at Littorio airport, Rome, July 10, 1929, after a flight from Old Orchard, Me., via Santander, Spain. For this flight they received Italy's gold medal for aeronautics, presented to them by Gen. Italo Balbo, Italian flier, as 20,000 spectators in Rome watched. Before returning to the United States the two were received in private audience by the pope.

Autogiro Pilot

Three years later Yancey came to San Diego, piloting an autogiro, in which he had flown to Mexico and Cuba, first plane of its kind to visit those countries. He gave several demonstrations with the craft at Lindbergh field, March 20, 1932. In flying from Havana to Merida, Yucatan, Yancey established a new long-distance flight record for autogiros, flying 500 miles. He was said to have been the only pilot ever to loop an autogiro.

Yancey and other members of the crew of the "Guba" brought Archbold's plane to San Diego last July 6 at the end of the flying boat's round-the-world flight.

The flier was a native of Chicago. His death, according to The International News Service, was caused by a cerebral hemorrhage. He had been in ill health for several months. Funeral services were set for today at Arlington national cemetery.

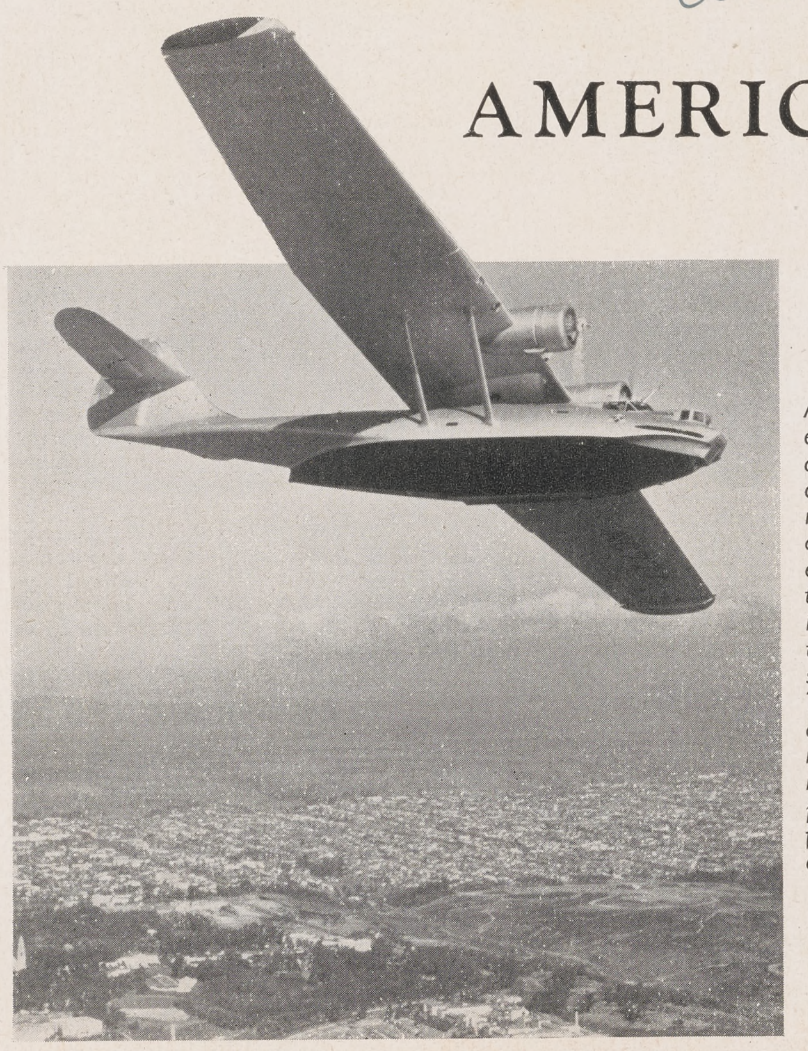
AMERICAN MEDLEY



A Consolidated 28. This aeroplane is of duralumin monocoque construction except for the wing trailing edge and the control surfaces. These parts, as in large numbers of modern aeroplanes, are fabric covered metal structures.

★

THE Consolidated Model 28 has made a name for itself by numerous long-distance flights. It will be remembered that Sir Hubert Wilkins flew one over 19,000 miles of the Arctic in search of the lost Russian Trans-polar fliers headed by Levaneffsky.

Among the most noticeable features of these flying boats are the floats which retract in such a manner as to form the wing tips themselves. It is claimed that the floats in their retracted position cause no drag, and actually increase the aspect ratio of the wing. Should the retracting gear fail the floats keep sufficient buoyancy in their retracted position to permit a landing to be made. In the lowered position they serve effectively as airbrakes during the approach for landing.

The whole aircraft is of duralumin monocoque construction except for the wing trailing edge and the control surfaces. These parts are of metal construction and fabric covered.

The hull is divided into five water-tight compartments with water-tight doors, and any one of these compartments may be flooded without the boat's sinking.

The fuel tanks are built integral with the wing, thus giving a large fuel capacity for a low structure weight.

For defence, the Model 28 carries four machine guns—one in the bow, one on each side of the deck behind the wing, and one in the hull bottom just forward of the tail. This is known in America as a tunnel gun.

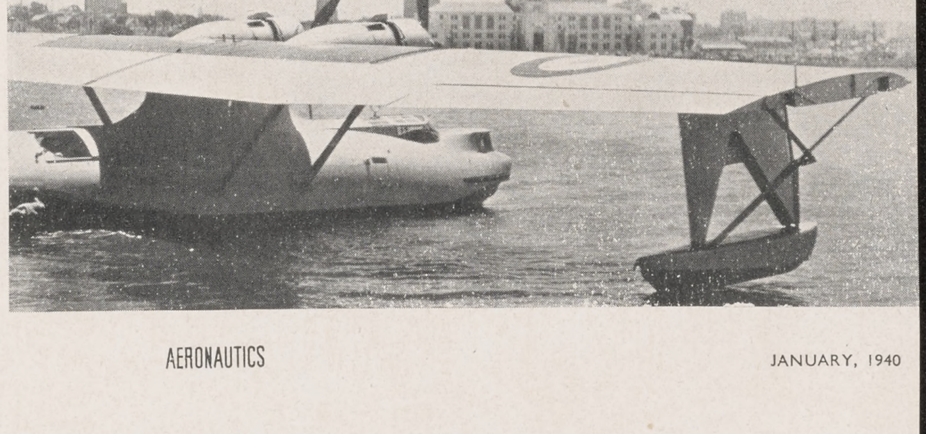
For offensive action bombs or torpedoes may be carried internally in the wing outboard of the engines. The bomb aimer has a station below the bow gunner.

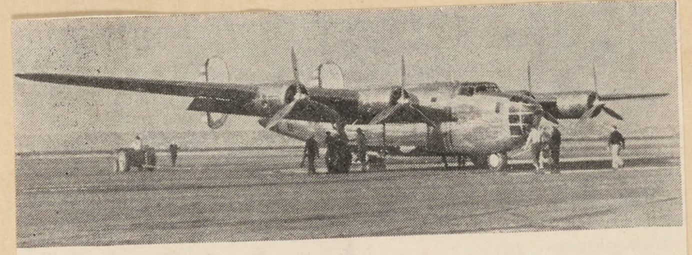
A flight engineer is carried, and only those engine controls which are absolutely necessary for the safety and manœuvrability are located in the pilot's compartment. The remainder are relegated to the flight engineer who occupies a compartment situated approximately between the engines, being separated from the pilot by the radio operator and the navigator. All members of the crew can keep in touch by telephone.

This flying boat is available in several other forms, the most important of which is as a commercial transport machine. For this purpose it can be converted into an amphibian by the addition of a retractable tricycle undercarriage. As a passenger machine it can cruise at a speed of 150 miles an hour using 53 per cent. power. The range varies from 600 miles with 40 passengers to 2,500 with 12 passengers. A crew of four is carried.

At present about 200 of these boats have been built, mainly for military purposes.

This photograph of the Consolidated 28 shows the retractable wing tip floats, and one of the two deck gun positions just aft of the wing. The sliding hatch cover is hinged at the front, so that it can be raised to shield the gunner from the slipstream.

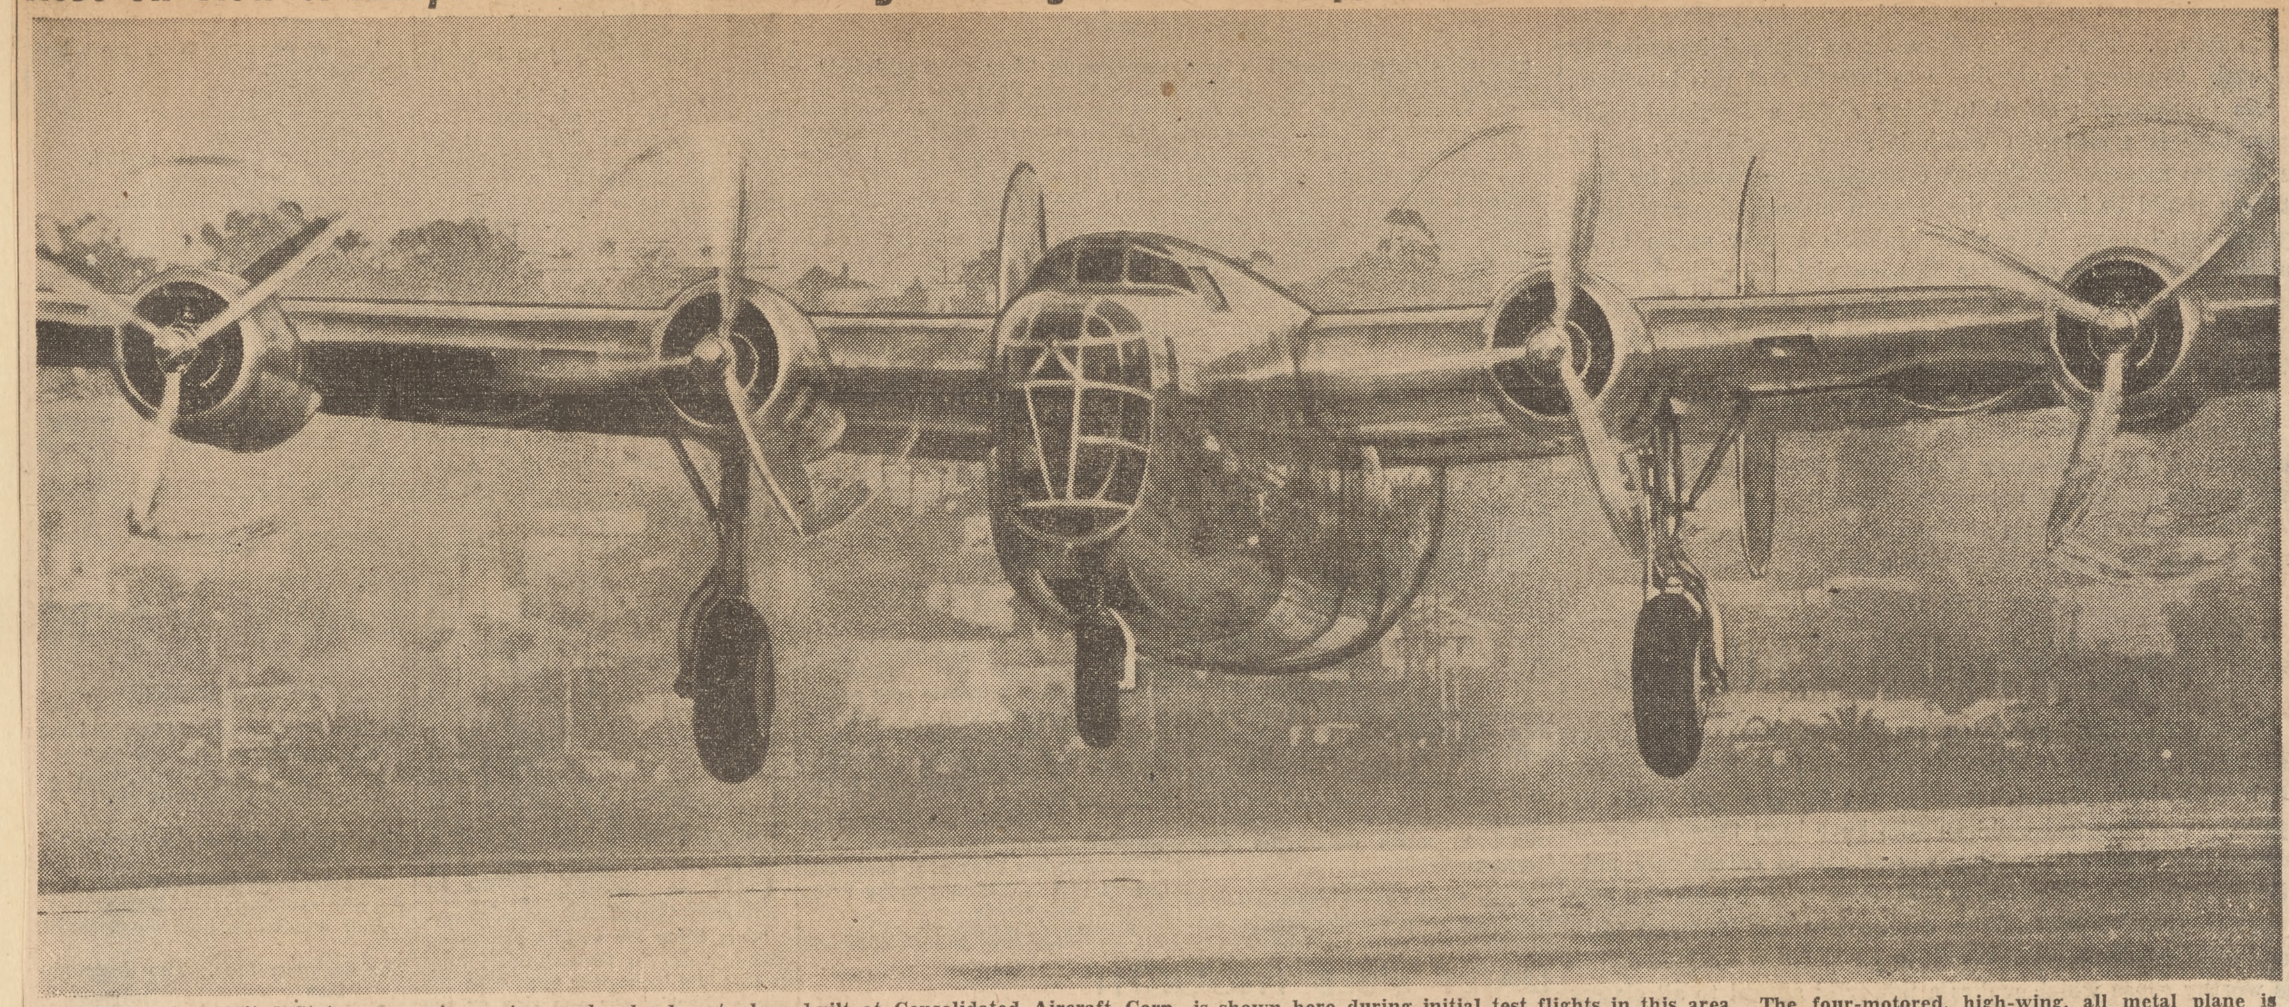




Still on the secret list of the U.S. Army Air Corps, this Model 32 four-engined bomber (Army designation, XB-24) is CONSOLIDATED AIRCRAFT CORPORATION'S latest product. Powered by PRATT and WHITNEY 18-cylinder Double Wasp A6-G series engines, each of 1,850 h.p. for take-off, this huge craft has an approximate gross weight of 40,000 lbs., length of 64 feet, span of 110 feet, and height of 19 feet. Its crew numbers from 6 to 9 members. The aircraft is of all-metal construction, has a speed greater than 300 m.p.h., range of 3,000 miles, and bomb-load of four tons. Fifty of these craft were in the order for 1,400 warplanes placed by the Allied Purchasing Mission on May 14. This picture was taken at Lindbergh Field, San Diego (California), as the big fellow was being towed out preparatory to a test-flight. Most people know CONSOLIDATED'S name and reputation in connection with flying-boats, and it comes as quite a piece of news to learn of such a big land-plane emanating from their workshops.

AIRLOG--May 1940

Nose-On View of Army's Newest 'Air Dreadnaught' Taking Off on Test Hop; Craft Built at Consolidated Plant Here



XB-24, the United States army air corp's new bombardment plane built at Consolidated Aircraft Corp., is shown here during initial test flights in this area. The four-motored, high-wing, all metal plane is powered by four Pratt & Whitney 18-cylinder, twin-row radial air-cooled engines, rated at 1200 horsepower each. Weighing approximately 40,000 pounds, the craft has a wing span of 110 feet. It is 64 feet in length and has an overall height of 19 feet. It carries a crew of from six to nine. Speed is estimated at more than 300 miles an hour. The cruising range is approximately 3000 miles and the bomb-carrying capacity is approximately four tons.—(Photo by Harry T. Bishop.)

CONSOLIDATED of San Diego

Has a daylight factory built for line production of large aircraft.

By C. F. McReynolds
West Coast Editor, Aviation

LOCATED on Lindbergh Field, San Diego, California, the Consolidated factory has been built from the ground up to handle large aircraft. We might say that the plant has been built "from the water up" as most of the ground on which it stands was reclaimed from San Diego Bay and this filled land has presented certain special problems which had to be solved in building the factory and installing certain heavy machinery. The Consolidated factory is located in the Southern California aircraft industry area which provides unusual facilities for supply of all needed materials and supplies, as well as a favorable reservoir of trained men. The plant is located on Lindbergh Field, with unobstructed access to runways, and to quiet waters for launching and flight testing of flying boats. Supplies may be and are brought in by water, rail, highway, and air, with delivery right at the factory door. Equable weather conditions in the San Diego area have made it practical to build a factory that is "all windows and doors", of relatively light, long span roof construction, and with no major heating problem. In addition, a high percentage of operations are performed in the factory yard, which serves as an integral part of the plant without requiring the expenditure of capital for roofing, heating, etc. Enclosed by a high fence, the yard area is well supplied with electric power outlets, air, water, and other facilities, and is used for a major portion of all final assembly operations. The area under roof at the Consolidated plant is approximately 450,000 sq. ft., with an additional 212,462 sq. ft. in usable yard area. The main factory building extends for 1025 ft. along the east side of Lindbergh Field, and has a width of 300 ft. Construction is of steel frame with saw tooth roof, galvanized iron siding, generous window area, and with almost continuous doors along the field side to permit shifting planes off the production line at any desired point. The east 200 ft. of the factory building has a ceiling clearance of 14 ft., as this area is largely devoted to miscellaneous manufacturing operations, machine shops, and offices. The remaining 100 ft. of factory width serves as the final assembly bay, extends the full length of the building, and has a height of 30 ft. Adjoining the main building at the center of the assembly side is the paint shop, measuring 200 by 100 ft., and also having a ceiling clearance of 30 ft. This permits shifting hulls and other bulky parts out of the assembly line, into the paint shop, and back to assembly without difficulty. An experimental building is located south of the main plant and separated from it by a 50 ft. alleyway. This building, of construction similar to the main building, houses an experimental section measuring 225 by 250 ft. with a 40 ft. ceiling clearance, and a receiving stores section 125 ft. square, with a second floor which carries the engineering department. There are two mezzanine floors extending around three sides of the experimental shop, the fourth being reserved for doors opening on the flying field. The lofting department of engineering occupies a major part of these mezzanine areas. Other Consolidated factory buildings located adjacent to the main plant include the wood mill, tool storage shed, laboratory, and paint storage building.

The modernization program recently completed entailed an expenditure of more than $500,000 for new equipment alone. Although presses and drop hammers represented the major items of expenditure, numerous pieces of equipment were added to the machine shop, including three Brown & Sharpe automatic screw machines, two Cleveland screw machines, a Cincinnati centerless grinder, and a LeBlond gap lathe to swing 50 in. For the drop hammer die foundry two James H. Knapp gas fired tilting type melting furnaces were installed, each with a capacity of 8,300 lbs. of zinc alloy or 12,000 lbs. of lead. To supply power for the new air operated drop hammers a Worthington 20 in. x 12 in. x 14 in. horizontal two stage compressor was installed. Driven by a 200 h.p. electric motor, this compressor has a capacity of 1150 cu. ft. of air compressed to 100 sq. in. per minute. This brings the total air compressor plant to a capacity of 2275 cu. ft. per minute. A stand-by

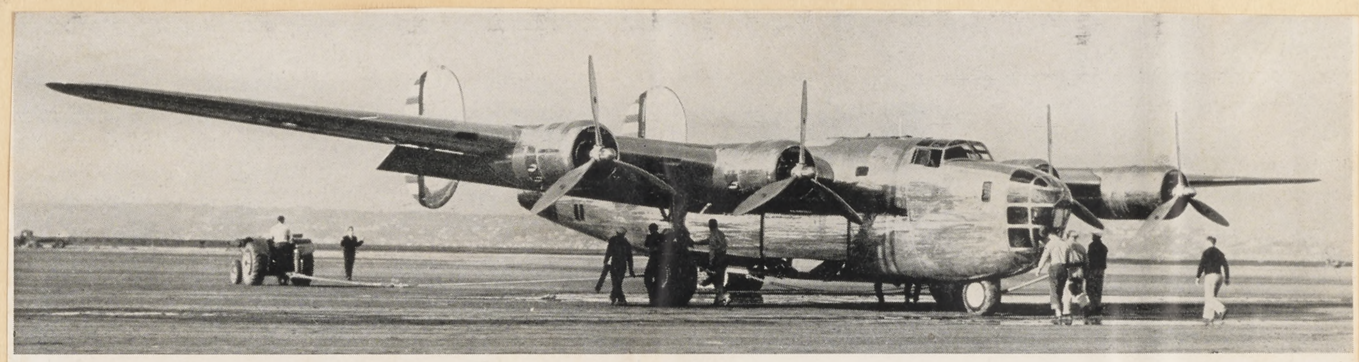
EQUIPMENT?

It becomes more and more a matter of conjecture as to what new marine aircraft shall fill the moorings at Rathmines and Port Moresby. Though Short "Sunderlands" were ordered some months ago and the first deliveries were supposed to have been made last September (which arrangement was thrown out of gear by the advent of the Hitlerian War) it is not by any means outside the bounds of possibility that, now the arms embargo section of the U.S.A. Neutrality Act has been passed into the discard, we may see some American flying-boats in local waters before we see the Sunderlands. And Consolidated flying-boats are very hot tips. In fact, in places where real fliers talk these things—not unimaginative political cloisterers—a shade of odds is given that the Yanks will have a long lead in representation here in Military flying-boats.



U. S. ARMY AIR CORPS XB-24 FOUR-ENGINED BOMBARDMENT AIRPLANE, BUILT BY CONSOLIDATED AIRCRAFT CORPORATION

A High-Wing, All-Metal Airplane, Powered by Pratt & Whitney 18-Cylinder Twin-Row Radial Air-Cooled Engines, Each of 1,200 h-p. The Propellers are Hamilton Standard 3-Bladed Hydromatic Constant Speed Types, 12 Feet in Diameter. Gross Weight of Plane is About 40,000 Pounds; Wing Span, 110 Feet; Length of Fuselage, 64 Feet; Overall Height, 19 Feet. Tactical Requirements are for Crew of 6 to 9, Depending upon Mission. Speed More Than 300 m.p.h., Range About 3,000 Miles, Can Carry About Four Tons of Bombs

Flying Equipment

CONSOLIDATED Amphibian

THE latest achievement of the Consolidated Aircraft Corporation is the building of the world's largest amphibian, the Model 28-5A, or as designated by the Navy, the XPBY-5A. The new amphibian is basically the familiar Model 28 twin engine flying boat, better known by its Navy designation, PBY. The change was accomplished chiefly by the addition of a tricycle landing gear which is fully retractable. The side wheels and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the retracted position is completely closed over by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, which handles all the necessary operations in sequence automatically and both the extension and retraction of the gear is controlled by a single lever. Hydraulic pump power is obtained either from the main power plant or from an auxiliary engine, but hand operation is possible, if necessary.

The landing gear has a number of advantages in addition to the obvious one of greatly extending the scope of utility for the Model 28. For rough water taxiing the extended gear greatly assists in control by serving as a sea anchor. More engine power may be applied for short turns without undue acceleration, and turns on the water may be accomplished with far less skidding. Naturally, all danger of scraping the keel on the ramp is eliminated, and no beaching crew is required, for the ship can climb a ramp or beach under its own power. It may operate from sand beaches with no special ramps or facilities for handling.

Since the side wheels are above water when the ship rises on the step, and since automatic means are provided for expelling water from the closed bow wheel hatch before the plane is in the air, the flying trim remains unaffected. Repairs or routine servicing to the landing gear may be made with a minimum of trouble. The beaching gear lugs of the Model 28 have been retained, so that a standard beaching gear may be attached and the plane run out of water. This lifts the landing gear clear of the ground so that any servicing may be carried out.

NATIONAL WHIRLIGIG TRIB 3/12/40

Partners

American airplane manufacturers, aided by army-navy experts, were responsible for killing the scheme under which the British mission would have bought only three types of American planes. The idea was originally sold to the foreigners by Capt. H. E. Collins, of the treasury procurement department, and Glenn Martin.

Under their plan the British would have concentrated on the purchase of the Curtiss pursuit ship, the Martin light bomber and the Douglas attack bomber. These three companies would have skimmed the cream of foreign orders. Ten rival firms would have been reduced to making parts or accessories, or they would have become subcontractors for the three favored corporations. They would have had to break up their staffs of engineers and experts, and the American airplane industry would have suffered. Moreover, it would have meant a tremendous expansion of the Curtiss, Martin and Douglas plants, and therefore a more violent social, labor and economic dislocation when the boom blew up.

Hard-boiled army and navy men impressed this fact upon Lord Lothian, the British ambassador, and Sir Herbert Self, who has replaced Arthur Purvis as London's chief plane purchaser (Purvis henceforth will have charge of buying industrial materials, not military stuff). Lothian was told that the scheme would antagonize powerful interests here, weaken America's attempt to aid the allies with aviation reinforcement, and he belatedly saw the point.

Consolidated Seeks 450 Craftsmen From Seattle

In an effort to get 450 skilled aircraft workers, Donald Frye, Consolidated Aircraft Corp. personnel director, conferred yesterday with Seattle labor officials, International News service reported.

Consolidated authorities said Frye has been contacting labor unions throughout the U. S. to get skilled help for the new shops soon to be added to the local factory. Three thousand workers are to be added to the payroll between now and July 1. UNION 3/13/40

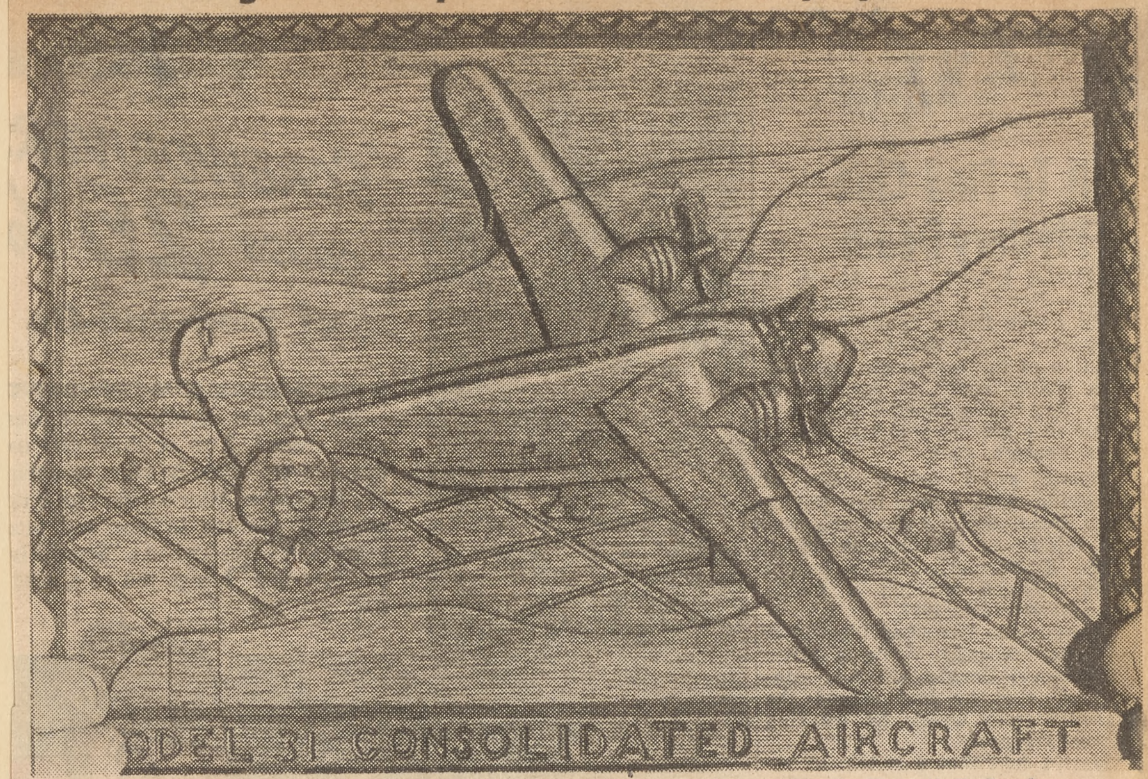
Seeking 450 Men For Consair Plant

Seeking 450 skilled airplane workers for the Consolidated Aircraft Corp., Donald Frye, personnel director, today conferred with Seattle union officials, The International News Service reported. He said the San Diego plant planned to hire 3000 more men by July 1.

TRIB 3/12/40

Wood Carving Hereditary Craft of Consair Employe

TRIB 3/12/40



Carved wood plaque of Consolidated Aircraft Corp.'s plane, Model 31, by Everett E. Jacobson.

WINNING RENOWN THROUGH WORK WITH AIRCRAFT

His great-grandfather was a wood carver in Gothenberg, Sweden. His grandfather, who came to the United States, was a carver and designed for the Pullman Car Co. His father, 13 years ago, won first prize in competition with 1100 contenders from all parts of the world in a display at the Metropolitan Museum of Art.

So, when Everett E. Jacobson, employed in the wood shop at Consolidated Aircraft Corp., became old enough to handle a knife, it was the thing for him to do—become a wood carver. Consolidator, monthly publication at the aircraft plant, devotes part of its "Wood Shop Chips" section, written by J. E. Hodgson, to Jacobson's wood carving ability.

Reproduces Tomb Objects

Jacobson carved designs to be reproduced in the Chrysler building, at New York City, and in the city hall at Denver. From 1931 to 1933 he made replicas of the objects discovered in the tomb of King Tut-Ank-Amen. His work at Consolidated is winning him renown in the aircraft field.

Commenting on the rarity of wood carvings, Hodgson, in his "Wood Shop Chips," says, "Wood carving is probably the oldest known handicraft and as such calls for a high degree of artistry and skill. In Europe, while a considerable amount of hand carving still is being done, in America, due to our high-speed technology it is almost unknown, except as a hobby or on articles designed to individual taste or requirement."

Jacobson's grandfather came to the United States to judge both wood and plaster carvings at the Chicago World's fair of 1893.

PLANE PLANT TO EXPAND

SAN DIEGO—A $1,050,000 permit to expand the Consolidated Aircraft Corp. plant to almost twice its present size was issued here by the city building's inspector's office.

Total cost of the new development, including equipment, is expected to approximate $2,000,000, plant officials have estimated.

It will involve the largest private construction activity here in many years.

Meanwhile, employment continued to soar at the factory, where giant Army and Navy bombers are being manufactured in a $40,000,000 backlog.

Of the 5400 aircraft workers on local payrolls, 4100 are employed by Consolidated.

Picture series above:

1. Here is the rotary shear again, being used to profile a flat sheet blank of fairly regular shape from a rectangular piece of sheet stock for the DC-3. This work can be performed quite rapidly as the blank is to be formed and so does not have to be cut with great precision.

2. Now we see the blank and its hydro press die with which it is to be both formed and sheared to exact size. Shearing is done by pressing with the rubber pad against a sharp-edged portion of the die. Results are surprisingly uniform and satisfactory. This process is patented by the Douglas Aircraft Company. One of the world's largest hydro presses is used for this work.

3. Here is the formed part as lifted from the die. Note that the two small holes have been both flanged and sheared.

4. Here's the inspector again—checking the shear work done by the hydro press.

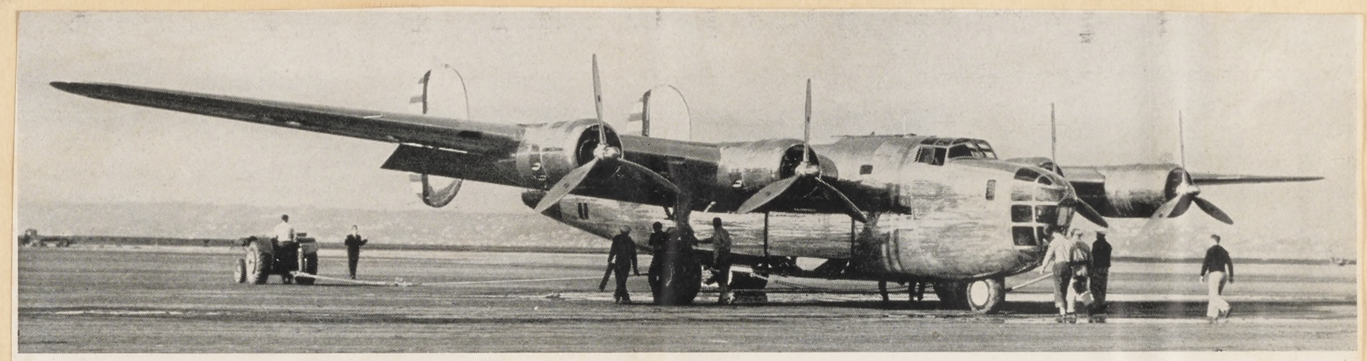
EQUIPMENT?

It becomes more and more a matter of conjecture as to what new marine aircraft shall fill the moorings at Rathmines and Port Moresby. Though Short "Sunderlands" were ordered some months ago and the first deliveries were supposed to have been made last September (which arrangement was thrown out of gear by the advent of the Hitlerian War) it is not by any means outside the bounds of possibility that, now the arms embargo section of the U.S.A. Neutrality Act has been passed into the discard, we may see some American flying-boats in local waters before we see the Sunderlands. And Consolidated flying-boats are very hot tips. In fact, in places where real fliers talk these things—not unimaginative political cloisterers—a shade of odds is given that the Yanks will have a long lead in representation here in Military flying-boats.



U. S. ARMY AIR CORPS XB-24 FOUR-ENGINED BOMBARDMENT AIRPLANE, BUILT BY CONSOLIDATED AIRCRAFT CORPORATION

A High-Wing, All-Metal Airplane, Powered by Pratt & Whitney 18-Cylinder Twin-Row Radial Air-Cooled Engines, Each of 1,200 h-p. The Propellers are Hamilton Standard 3-Bladed Hydromatic Constant Speed Types, 12 Feet in Diameter. Gross Weight of Plane is About 40,000 Pounds; Wing Span, 110 Feet; Length of Fuselage, 64 Feet; Overall Height, 19 Feet. Tactical Requirements are for Crew of 6 to 9, Depending upon Mission. Speed More Than 300 m.p.h., Range About 3,000 Miles, Can Carry About Four Tons of Bombs

Flying Equipment

CONSOLIDATED Amphibian

THE latest achievement of the Consolidated Aircraft Corporation is the building of the world's largest amphibian, the Model 28-5A, or as designated by the Navy, the XPBY-5A. The new amphibian is basically the familiar Model 28 twin engine flying boat, better known by its Navy designation, PBY. The change was accomplished chiefly by the addition of a tricycle landing gear which is fully retractable. The side wheels and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the retracted position is completely closed over by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, which handles all the necessary operations in sequence automatically and both the extension and retraction of the gear is controlled by a single lever. Hydraulic pump power is obtained either from the main power plant or from an auxiliary engine, but hand operation is possible, if necessary.

The landing gear has a number of advantages in addition to the obvious one of greatly extending the scope of utility for the Model 28. For rough water taxiing the extended gear greatly assists in control by serving as a sea anchor. More engine power may be applied for short turns without undue acceleration, and turns on the water may be accomplished with far less skidding. Naturally, all danger of scraping the keel on the ramp is eliminated, and no beaching crew is required, for the ship can climb a ramp or beach under its own power. It may operate from sand beaches with no special ramps or facilities for handling.

Since the side wheels are above water when the ship rises on the step, and since automatic means are provided for expelling water from the closed bow wheel hatch before the plane is in the air, the flying trim remains unaffected. Repairs or routine servicing to the landing gear may be made with a minimum of trouble. The beaching gear lugs of the Model 28 have been retained, so that a standard beaching gear may be attached and the plane run out of water. This lifts the landing gear clear of the ground so that any servicing may be carried out.

NATIONAL WHIRLIGIG TRIB 3/12/40

American airplane manufacturers, aided by army-navy experts, were responsible for killing the scheme under which the British mission would have bought only three types of American planes. The idea was originally sold to the foreigners by Capt. H. E. Collins, of the treasury procurement department, and Glenn Martin.

Under their plan the British would have concentrated on the purchase of the Curtiss pursuit ship, the Martin light bomber and the Douglas attack bomber. These three companies would have skimmed the cream of foreign orders. Ten rival firms would have been reduced to making parts or accessories, or they would have become subcontractors for the three favored corporations. They would have had to break up their staffs of engineers and experts, and the American airplane industry would have suffered. Moreover, it would have meant a tremendous expansion of the Curtiss, Martin and Douglas plants, and therefore a more violent social, labor and economic dislocation when the boom blew up.

Hard-boiled army and navy men impressed this fact upon Lord Lothian, the British ambassador, and Sir Herbert Self, who has replaced Arthur Purvis as London's chief plane purchaser (Purvis henceforth will have charge of buying industrial materials, not military stuff). Lothian was told that the scheme would antagonize powerful interests here, weaken America's attempt to aid the allies with aviation reinforcement, and he belatedly saw the point.

Consolidated Seeks 450 Craftsmen From Seattle

In an effort to get 450 skilled aircraft workers, Donald Frye, Consolidated Aircraft Corp. personnel director, conferred yesterday with Seattle labor officials, International News service reported.

Consolidated authorities said Frye has been contacting labor unions throughout the U. S. to get skilled help for the new shops soon to be added to the local factory. Three thousand workers are to be added to the payroll between now and July 1. UNION 3/13/40

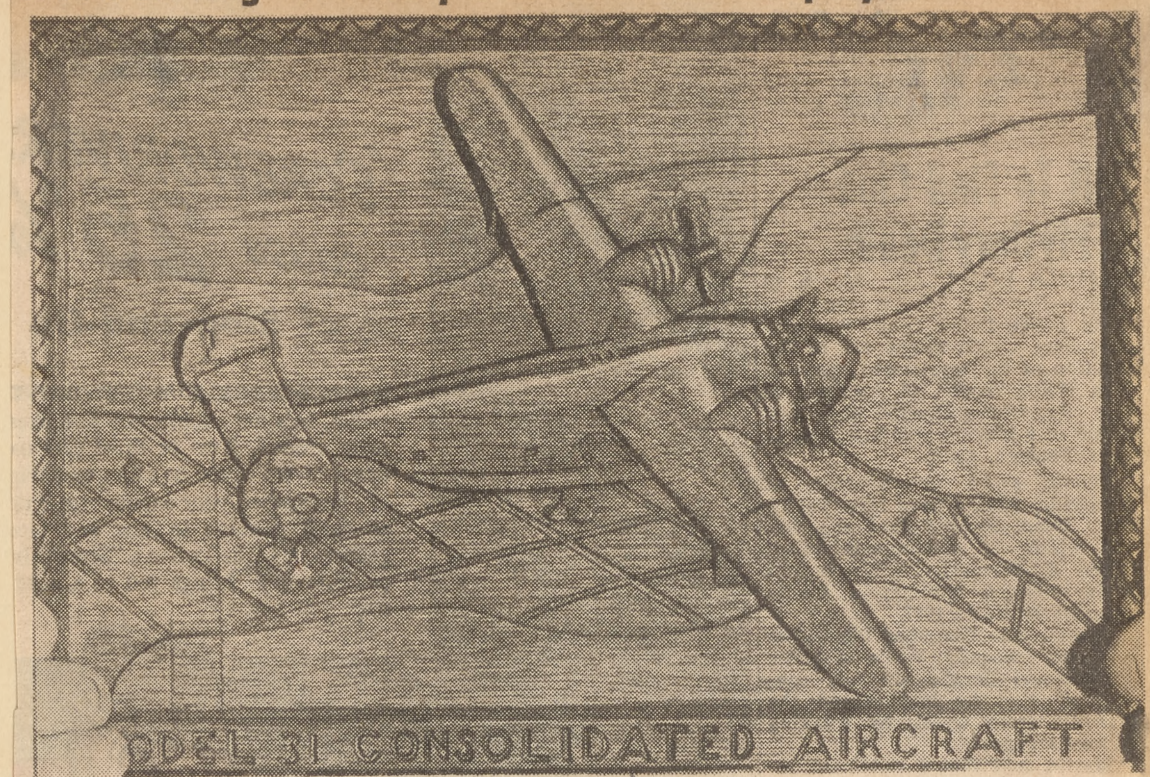
Wood Carving Hereditary Craft of Consair Employe

TRIB 3/12/40



Carved wood plaque of Consolidated Aircraft Corp.'s plane, Model 31, by Everett E. Jacobson.

WINNING RENOWN THROUGH WORK WITH AIRCRAFT

His great-grandfather was a wood carver in Gothenberg, Sweden. His grandfather, who came to the United States, was a carver and designed for the Pullman Car Co. His father, 13 years ago, won first prize in competition with 1100 contenders from all parts of the world in a display at the Metropolitan Museum of Art.

So, when Everett E. Jacobson, employed in the wood shop at Consolidated Aircraft Corp., became old enough to handle a knife, it was the thing for him to do—become a wood carver. Consolidator, monthly publication at the aircraft plant, devotes part of its "Wood Shop Chips" section, written by J. E. Hodgson, to Jacobson's wood carving ability.

Reproduces Tomb Objects

Jacobson carved designs to be reproduced in the Chrysler building, at New York City, and in the city hall at Denver. From 1931 to 1933 he made replicas of the objects discovered in the tomb of King Tut-Ank-Amen. His work at Consolidated is winning him renown in the aircraft field.

Commenting on the rarity of wood carvings, Hodgson, in his "Wood Shop Chips," says, "Wood carving is probably the oldest known handicraft and as such calls for a high degree of artistry and skill. In Europe, while a considerable amount of hand carving still is being done, in America, due to our high-speed technology it is almost unknown, except as a hobby or on articles designed to individual taste or requirement."

Jacobson's grandfather came to the United States to judge both wood and plaster carvings at the Chicago World's fair of 1893.

PLANE PLANT TO EXPAND

SAN DIEGO—A $1,050,000 permit to expand the Consolidated Aircraft Corp. plant to almost twice its present size was issued here by the city building's inspector's office.

Total cost of the new development, including equipment, is expected to approximate $2,000,000, plant officials have estimated.

It will involve the largest private construction activity here in many years.

Meanwhile, employment continued to soar at the factory, where giant Army and Navy bombers are being manufactured in a $40,000,000 backlog.

Of the 5400 aircraft workers on local payrolls, 4100 are employed by Consolidated.

AIRCRAFT NEWS 3/7/40

Aircraft Corp. Backlog Soars

Consolidated Aircraft Corp. of San Diego, in releasing its annual report disclosed that the backlog of unfilled orders had reached an all-time peak of $49,000,000, a volume sufficient to keep the plant busy until midsummer of 1941.

This represents an increase in the backlog of nearly $8,000,000 since the first of this year, the unfilled orders at the close of 1939 having been $42,141,694. The company stated that during the past few months it had received contracts from foreign customers for a released version of the PBY ship, a two-engine long-range navy patrol bomber.

system is provided to supply Butane gas to the boilers, heat treat equipment, and furnaces in emergency.

A new salt bath furnace was installed in the heat treat department, with a capacity to heat treat 2000 lbs. of aluminum alloy parts per hour in a salt pot 21 ft. long and requiring approximately 18,000 lbs. of potassium nitrate and the same amount of sodium nitrate for its initial charge.

Additional facilities provided in the paint shop include a huge paint booth for hull finishing. Measuring 30 ft. long, 20 ft. wide, and 18 ft. high, this booth has complete lighting and ventilating facilities. Two open front booths for miscellaneous spray work are 10 ft. high, 8 ft. deep, and 30 and 65 feet long respectively. Air is pumped through the paint shop at the rate of 203,000 cu. ft. per minute by means of nine exhaust fans requiring 62½ motor horsepower.

Major new equipment item, and the center of greatest interest in connection with the modernization program, is the battery of presses and drop hammers installed. This includes a 4500 ton Birdsboro hydraulic press, a 1000 ton Hamilton double crank punch press, four Chambersburg air operated drop hammers, and four new rope lift type drop hammers of Consolidated design and manufacture. The Birdsboro-HPM press has a 48 in. working stroke, a platen area 140 by 118 in., a total weight of 610,000 lbs. and a foundation weight of 225,000 lbs. The air operated drop hammers vary in size from 101,000 pounds gross weight down to 33,000 lbs. The big hammer has a stroke of 72 in. and platen area 48 by 96 in. It can accommodate punches, or dies, up to 50,000 lbs. in weight. The foundation weight, for the inertia block alone, amounts to 415,000 lbs.

Installation of these drop hammers occasioned unusual engineering difficulties due to the filled ground on which the plant is built, which we referred to earlier. Since the hammers were to be installed in the center of the main factory and quite close to the offices, it was considered desirable to minimize if not eliminate the pounding action usually associated with operation of drop hammers. Also, due to the unsatisfactory bearing qualities of the sub-soil, it was feared that such a heavy drop hammer would pound its foundation, no matter how massive, right down through the floor and out of sight. Load bearing and vibration transmission problems were solved simultaneously by provision of an ingenious "earthquake proof" mounting. Steel piles of "H" section were first driven 60 ft. into the sub-soil. As the roof clearance was only 30 ft. it was necessary to drive these piles in increments, welding on short sections as the work proceeded. A heavy concrete foundation "box" was constructed on top of these pilings, with the top of the box open and flush with the factory floor. Inside the
inertia block was constructed

These new penumatic drop hammers are mounted on inertia blocks supported on coil springs and specially driven steel piles.

Consolidated

(*Continued from page 46*)

with the net result that at little more than the cost of wood parts the production line is fitted with metal fixtures and jig parts that are every bit as satisfactory as steel for the limited runs produced on them.

As metal has supplanted other materials in airplane construction the machine shop has become the heart of aircraft production. At Consolidated 85 per cent of all machine work is performed in the company's own machine shops. Tool room and production machine shop work more or less interchangeably, the tool room shifting over to production machine work as tooling is completed for a major manufacturing run on a single model. So important is the elimination of lost time between design and delivery that production of a new type is usually started through the machine shop simultaneously with tool and fixture orders that go to the tool shop. As special fixtures and jigs become available they are placed in the production line, but production does not wait on them.

Tool room equipment ranges in size and character from the huge Cleveland planer with 30-ft. bed to the Societe Genevoise (Swiss) jig borer used on precision jig work. Most blanking dies are made on the DoAll Metalmaster from ⅛ in. crucible steel sheet, with a hardened punch ⅛th in. thick, at a cost one-third that of the conventional blanking die. It is economical to make such dies for production runs as small as thirty parts. Other special tool room equipment includes a Pratt & Whitney surface grinder, a Fosdick Radial for large jig and fixture work, and the usual battery of lathes, mills, shapers, etc.

Sheet metal shop equipment includes a Cincinnati brake with a 10 ft. throat, which may be extended to 15 ft. by end brackets used in connection with light alloy work; and a Cincinnati shear with a 14 ft. throat, used for trimming and external profiling of large sheet metal blanks. A battery of Niagara punch presses handles a multitude of blanking, forming, drawing, joggling, notching, perforating, nipping, dimpling, crimping, slotting, and burnishing operations, and even some small shear work. In order to get maximum use of the punch presses an ingenious system of dies has been developed, including spring die sets, magnetic die holders, notching and slotting dies held in special die sets, and a fascinating technique in handling joggling dies. Joggling, offsetting, or crimping, is of special importance in joggling or off-setting plate, sheet, or extruded or drawn sections in order properly to assemble certain complex fittings in an aircraft structure. A clever system of joggle dies, using a sliding shoe and return springs, serves to convert the vertical motion of the punch press into a desired transverse and angular motion to achieve the various degrees of joggle required.

Remarkable BOAT

By
HARold KEEN

The U. S. Navy has about 225 PBY's and is expected to order more in the form of the latest PBY-5

THE world's most remarkable flying boat is an American product—the creation of an American concern's inventive genius, engineering skill and manufacturing efficiency. Snow and ice fields of the Arctic, the uncharted airways over the Indian Ocean, the peaks and plains of America, and the brooding majesty of a mountain-imprisoned lake 11,500 feet above the sea in an equatorial wilderness have known this rugged lord of the skies.

Little more than four years have elapsed since the Consolidated PBY-type seaplane emerged from the experimental stage and stood acceptable to the United States Navy. In that period, its utility as a scouting instrument has been so dramatically demonstrated that this country now can be said to possess a chain of outposts along a defense frontier 2,000 miles from its own shores or those of any of its possessions.

Outposts in the ocean? Yes, they're out there and none the less effective because they don't *seem* to exist. For, if the time comes that they must be occupied, whole fleets of PBY's will hover above the outermost line of defense to spot the enemy and will range the trackless thousands of square miles to the rear, back toward the visible bases on land.

These 13-ton craft won't have to be sent out merely to locate and then run for cover. With giant bombs or torpedoes secured to the 104-foot wing, they can deliver mighty deadly wallops. Well aware of the versatility, the reliable performance and the longevity of the PBY, the Navy has in operation more than 200 and before this is published will have ordered a substantial increase to this long-range sky armada. The PBY, after a thorough, extensive trial, has been adopted as the keystone of American aerial intelligence, to which is entrusted the obtaining of information on hostile Fleet movements long before enemy warships could be seen from American waterfronts. With U. S. naval strategy essentially that of engaging the enemy many miles from our territory, the role of the PBY has become a vital one, indeed.

Non-stop mass flights across great oceans and between far-distant bases have been made to appear so simple by the Navy's present-day patrol bombers that it is difficult to realize the first of such feats was accomplished only six years ago. In January, 1934, half a dozen P2Y's, sesquiplane predecessors of the PBY, commanded by Lieut.-Comm. Knefler McGinnis, took off from San Francisco harbor in an event of epochal importance. They were headed for Pearl Harbor, Hawaii—an unprecedented attempt which was authorized only after the Navy had probed completely the planes' long-range capabilities. Material failure could prove fatal. No stopping-off points existed between San Francisco and Hawaii. Faith in the P2Y's was rewarded and a new era in Naval aviation launched when the intrepid flyers landed at Pearl Harbor 24 hours, 56 minutes later, without mishap or untoward incident. The big flying boat had come of age. The P2Y now was in demand, not only here but abroad. They were sold to Colombia, Argentina and even one to Japan.

S. D. Planes Released For Sale to Allies; Hint 9 Million Order

TRIB 3-14-40

By HAROLD OSBORNE

The drone of bombers over riddled Poland, which led to declaration of war by the allies, echoed at San Diego today with an announcement by Consolidated Aircraft Corp. officials confirming Washington, D. C., reports that Consolidated PBY-type planes have been released for the allies use. The "blitzkrieg" of last September has resulted in "substantial orders from abroad" being received by Consolidated, it was reported.

First official word that Consolidated planes were contemplated for sale to certain European powers came in a United Press dispatch quoting Rear Adm. John H. Towers, chief of the navy

(Continued on Page 4A, Col. 3)

Release S. D. Planes For Sale to Allies

CONTINUED FROM PAGE ONE

bureau of aeronautics, as saying that "four types of navy planes have been or will be released to the allies by the joint army-navy aeronautical board." He said they were the Vought FB2U and the twin-engined Consolidated PBY flying boats, the Brewster fighter, and Grumman monoplane fighter, all of which have been stripped of secret equipment, such as bomb sights.

Silent on Details

A Consolidated spokesman confirmed the statement that the firm here has received from the government a release for export sale of the PBY planes, and said "we are well along in the early stages of construction." He declined to announce the number of planes being built, for what nation they were consigned, or the price of the contract, which is believed to be nearly $9,000,000.

The "guess" on the contract price for the foreign order is based on the annual report of Consolidated, released last week, which revealed the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 previously announced. While Consair officials refused to comment on the $9,000,000, authoritative sources said it involved orders by a foreign nation or nations.

Flight Records Set

The PBY-type planes are those used by the American navy as patrol bombers, and have established many group distance flight records, notably from San Diego to Panama and Hawaii, and from Hawaii to the Philippines. Soon after delivery of the first plane of the PBY series a few years ago it established a new international distance record of 3443 miles in a flight from Coco Solo, C. Z., to Alameda. Subsequent refinements have extended the range beyond 4000 miles, and in 1937-38 alone the navy made three "routine delivery flights" of 42 PBY planes from here to Hawaii, a distance of more than 2500 miles, and two "routine deliveries" of 26 planes from here to Coco Solo, 3000 miles. Last year the planes flew from San Diego to the Caribbean sea for United States fleet exercises.

The PBY's are the world's longest-range two-engine flying boats, and their speed exceeds 200 miles an hour. One PBY, the Guba, owned by Richard Archbold, aerial scientist, flew around the world after being used 10 months in New Guinea scientific exploration operations. A commercial PBY was flown by Sir Hubert Wilkins over 19,000 miles of Arctic wastes under the most adverse weather conditions, in search of the lost Russian transpolar fliers headed by Sigismund Leavaneffsky. Ability of the planes to "take it" were demonstrated in special single-engine take-off tests, which proved it was possible for a PBY to take off with only one engine with sufficient fuel to continue flying a distance of more than 1300 miles. Consolidated officials said it is believed this feat is unequalled in flying boat history.

Effect of the allied order for the planes, coming after $40,000,000 in American army and navy planes had been placed with Consolidated, is reflected in increased employment. Maj. R. H. Fleet, Consair head, said in the annual report that 4300 are working at the plant in three shifts, and that approximately 100 men a week are being added.

PBY statistics show a maximum range of 4200 miles, a service ceiling of more than 29,000 feet, the ability to climb to 15,000 feet in 13.4 minutes, and full speed at 12,000 feet, 194 miles an hour.

Steel Arrives For Consair's New Buildings

UNION 3-15-40

By HOWARD MORIN

Laden to the plimsoll mark with steel for the Consolidated Aircraft Co.'s new buildings, canned goods and general merchandise for other Pacific coast ports, American-Hawaiian line steamer American will dock at the B st. pier tonight from Baltimore and Philadelphia. The fabricated steel is but part of shipments arriving by rail and water from Pennsylvania steel mills for Consolidated's expansion building program.

The Quaker line will have two intercoastal steamers in port over the week-end. Westbound, the San Rafael is due tomorrow from eastern ports with 350 tons local cargo. The Peter Kerr is to berth at B st. pier Sunday to load 350 tons kelp meal, canned goods and beans for eastern markets.

UNION 3-15-40

Foundations Laid For Navy Buildings

Consolidated Aircraft Co. officials announced yesterday that foundations for the group of new buildings, which will virtually double capacity of the plant, have been completed.

Construction of the addition to the experimental building has started, and steel rapidly is being delivered for the other structures. All of the new structures will be in use by June 1.

Officials said that authority has been received from the government to export the company's PBY-type planes, of which a number already has been sold to foreign governments.

Consolidated Factory Expansion

ANNOUNCEMENT was made by the Navy Department on December 20 that the Consolidated Aircraft Corporation had been awarded a contract for $20,016,699. This is the largest single order for aeroplanes ever placed by the United States Government, and it increased the backlog of Consolidated to over $40,000,000. With work on other contracts occupying most of the production capacity, the new record order has made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

The building expansion will aggregate approximately 396,000 sq. ft., or an increase in the present area of 87 per cent. The largest single area to be roofed is the new final assembly building measuring 360 feet by 720 feet. This has a clear span of 120 feet and a clearance from floor to roof truss bottoms of 36 feet. In addition to the buildings, all factory yard areas will be paved with asphaltic concrete. These areas, due to the mild southern Californian climate, can be used virtually the entire year round for final assembly operations.

MAMMOTH ARMY WARBIRD DWARFS HUMANS

THREE S. D. AIRCRAFT PLANTS MAY BE FORCED TO EXPAND

Business Volume Biggest in History; Foreign Orders Boost Local Backlogs

By HOWARD MORIN

San Diego's aircraft manufacturers, working at top speed on orders exceeding $50,000,000, may have to continue their expansion program.

The three Lindbergh field plants, Consolidated, Ryan and Solar, whose total personnel by midsummer will exceed 9000, will be will be vitally affected by the action of the British and French governments in purchasing nearly a billion dollars' worth of new American warplanes.

ORDERS MAY DOUBLE

Consolidated Aircraft Corp., whose backlog of foreign and domestic orders is the largest in the company's history, is negotiating with the British and French purchasing commission, authorities said. Consolidated's current foreign orders for $9,000,000 in planes and spare parts is expected to be doubled or tripled as a result of negotiations under way.

The Ryan and Solar plants probably will be called upon to manufacture special equipment for the 8000 planes which the French and British are planning to have built in American aircraft factories.

HUGE BAGKLOG

The American aircraft industry consists of 45 plane and 13 engine manufacturing plants. Of these 23 plane and nine engine plants are working on military orders. According to the aeronautical chamber of commerce, their current backlog totals $500,000,000.

Despite the tremendous expansion program which has resulted in doubling the facilities of San Diego's aircraft factories, American plane plants occupy a relatively unimportant place in the nation's industrial structure. Sixty thousand persons are on aircraft shop payrolls compared to 600,000 on automotive plant and related industry payrolls.

Since President Roosevelt proclaimed a state of "limited national emergency," the secrecy that has surrounded the aircraft manufacturing industry is equaled only by that of shipyards building new warships for the navy. Few industries have as many government-imposed restrictions. The factories are honeycombed with military and navy inspectors and government agents. Yet no other industry is so fearful of the results of over-expansion, a fear that has dictated extreme caution in adding to its backlog.

SET FOR SLUMP

Local aircraft manufacturers are keenly alive to the fact there will be a slump at the end of the war, but they are taking extraordinary precautions to avoid major lay-offs when this time comes. They are attuned primarily to the growing needs of American aviation, military, navy and commercial, and only in a limited way to foreign markets. They say emphatically that the three local plants are not "war babies." In fact they are anything but that. They were operating on a substantial basis long

(Continued on Page 2-A, Col. 3)

Business Volume May Force Plane Plant Expansion

(Continued from Page 1)

before the allies and Germany went to war.

To legislation establishing airlines which buy from aircraft and aircraft engine makers, and to millions of dollars in orders from the American armed forces over a long period is attributed the present prosperity of the industry, and particularly the three local plants.

EXPANSION PRE-ARRANGED

Lindbergh field plane manufacturers explain that long before orders from foreign governments began to pour in after the war started, plans had been perfected for plant expansion. Leases for additional tidelands to meet increased building programs were sought and obtained from the harbor department. The need for additional shop and assembly space became apparent when Americans, in constantly increasing numbers, began taking to the air.

A striking example of this is the official government announcement that commercial and military planes worth $40,000,000 are produced each month from American factories. By mid-June it is estimated the monthly productions will be valued at $55,000,000.

On domestic commercial and on foreign commercial and military orders, profits of manufacturers are limited to 12 percent under the Vinson-Trammell act when dealing with the U. S. government, and only by their shrewdness when doing business with foreign buyers. Nevertheless the government maintains an effective check on foreign shipments by permitting only certain types to be exported.

FUTURE CONSIDERED

Because the prosperity of the industry depends fundamentally on decisions of many governmental agencies and congressional appropriations, most manufacturers are extremely chary of expanding their plants unless they are reasonably sure of future orders that are not dependent primarily on continuation of the European war.

In line with this policy San Diego's aircraft factories are exceedingly fortunate, as less than $10,000,000 of the total $50,000,000 backlog is for foreign contracted planes.

Less than 15 years ago San Diego's aircraft industry was confined to manufacturing and flying operations of one company.

Today the industry's payroll runs into millions of dollars annually and planes are produced that literally traverse the world's skyways. Backlogs are building up. And there is every indication they will continue, officials say, for transportation by air is getting safer, swifter and more exhilarating with every new model produced by American engineers.

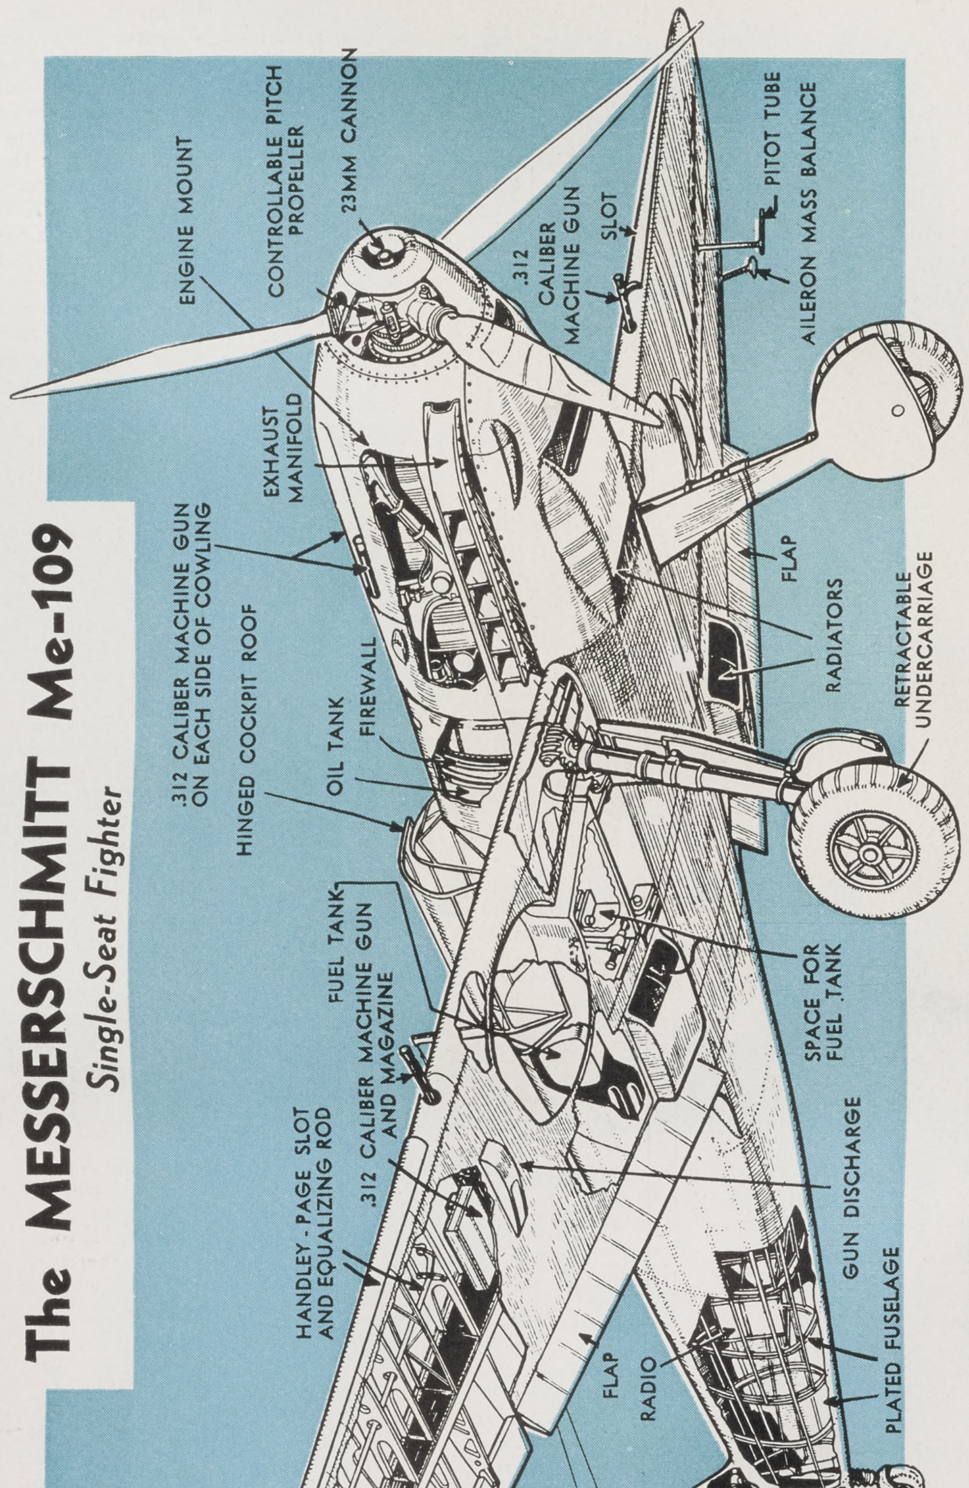
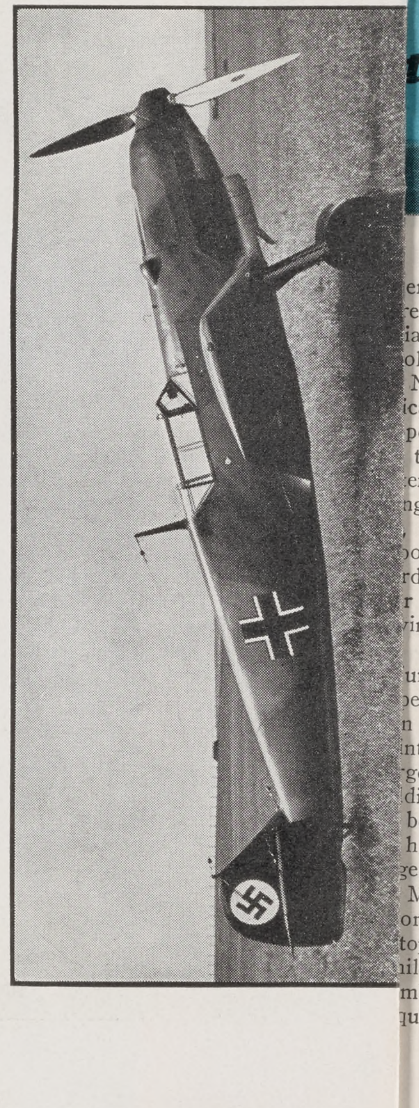
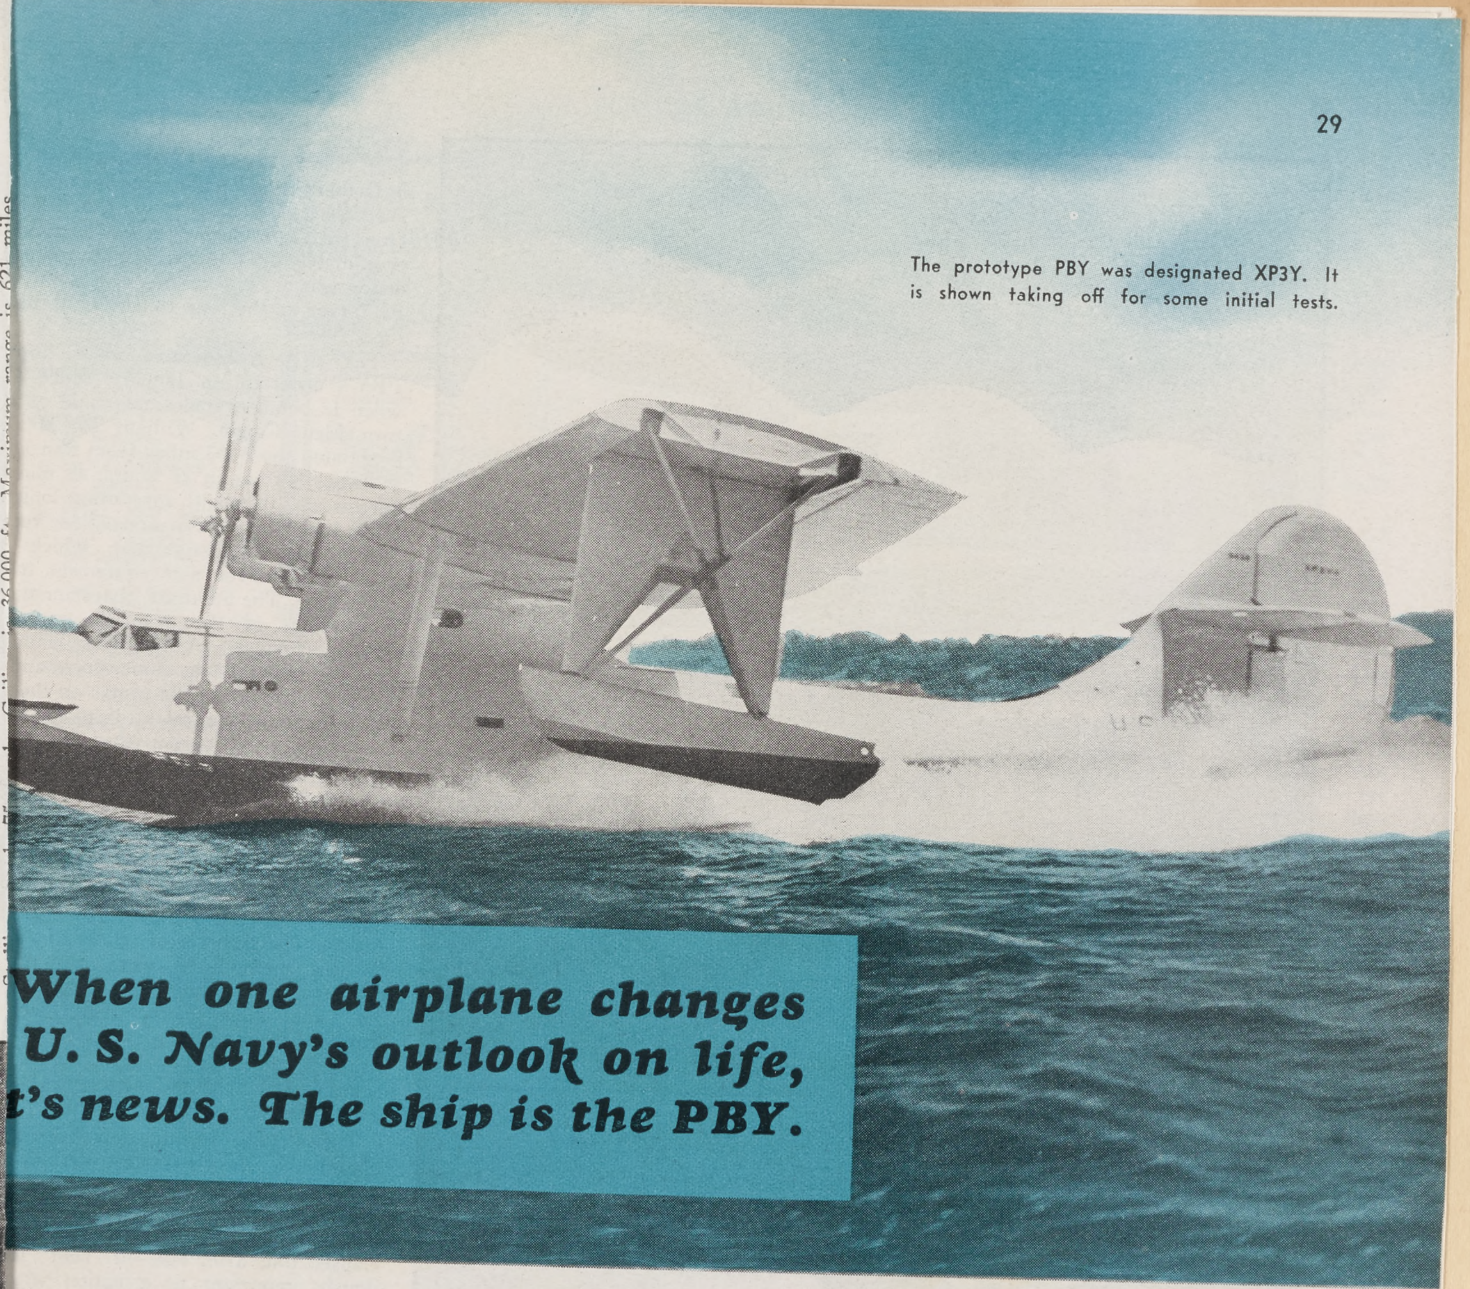
The MESSERSCHMITT Me-109

Single-Seat Fighter



THE fighting plane on this page is to the current war what the deadly Fokker D-7 was to World War I. However, the Messerschmitt Me-109, for all its notoriety, has not achieved for the Germans the same degree of success scored by the Fokker. Yet, the Messerschmitt is a deadly foe that British and French airmen have reason to fear. The cutaway drawing above is reprinted through the courtesy of *The Aeroplane*, famed British aviation publication. It is the most detailed drawing of this much-discussed German fighter ever published. This drawing is of the latest version of the Me-109, powered with an 1,150 h.p. Daimler-Benz engine. A 23 mm. (.906 in.) cannon fires through the hub of the controllable-pitch propeller. Other armament consists of four machine guns. With the exception of fabric-covered control surfaces, the Me-109 is built entirely of metal. Wing span is 32 ft. 6 in., length 32 ft. The landing gear retracts outward. Handley Page slots and slotted flaps are standard. Empty weight is 4,180 lbs., loaded weight is 5,520 lbs. Full radio and oxygen equipment is included. Top speed at 12,300 ft. is 354 m.p.h. Cruising speed (62½ per cent power) is 298 m.p.h.





The prototype PBY was designated XP3Y. It is shown taking off for some initial tests.

When one airplane changes U. S. Navy's outlook on life, t's news. The ship is the PBY.

the outstanding characteristics of
eries were merged with unique new
es in engineering of the PBY. An
ian-born engineer, Henry Ikarus
olf—he is a graduate of the Aus-
Naval Academy and now a loyal
ican citizen—conceived the important
pearing pontoon" which helped in-
the efficiency of the PBY's to such
ent they became comparable in load

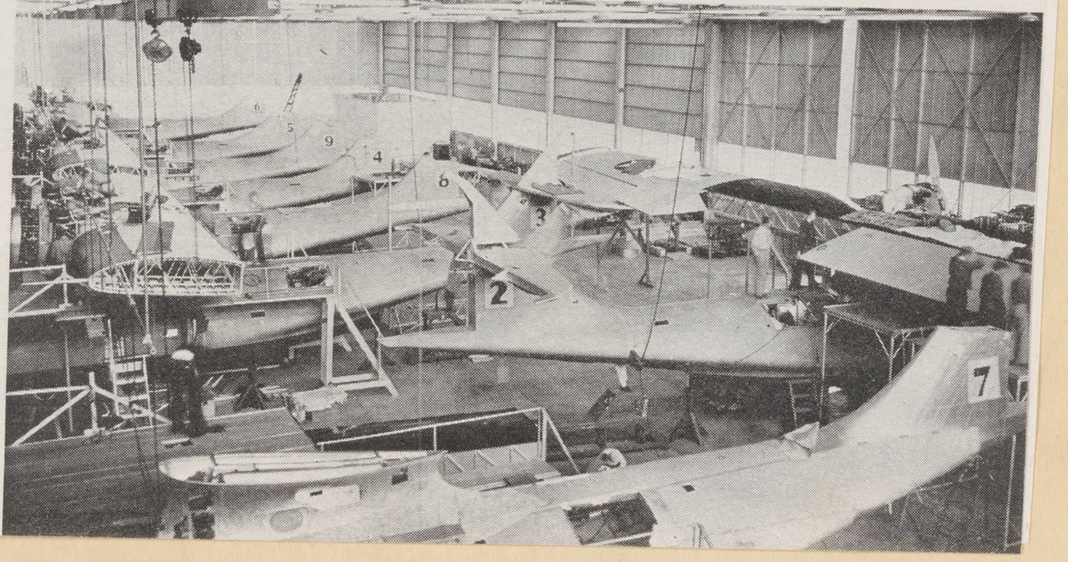
, four-engined transoceanic clippers.
ontoons were designed to retract
rd and form the wing tip of the
r in flight, thus reducing drag and
ing the effective aspect ratio of the

urther contribution to the PBY's
erformance characteristics was the
n of the fuel tanks, which were
ntegrally with the wing, allowing
ge gasoline capacity at a minimum
ditional structure weight which
be entailed by separate tanks. The
hull, thus, is available for crew,
gers and cargo.
Model 28—Consolidated's designa-
or the PBY—has exceeded 190
top speed, has a maximum range of
iles, a service ceiling of 29,200 feet,
mb to 15,000 feet in 13.4 minutes
uires less than a minute for full-load take-off. Russell Rogers, chief pilot of Richard Archbold's airboat "Guba"—a commercial version of the PBY—who is considered one of the world's greatest large airboat aviators, has been known to lift his craft off the water in 20 seconds.

Full cantilever tail and stressed skin monoplane wing were innovations in a seaplane of this size when introduced, with resounding success, by the PBY.

Approximately 225 of these high-performance craft, at about $150,000 each, have been delivered to the Navy. Since acceptance of the PBY in 1936, its achievements have amazed the world—not primarily because of the distance or duration of flights, but because of the never-failing dependability of the planes, the lack of incident that characterized each new lengthy journey and the ease with which vast areas of land, as well as water, were spanned. Forerunner of all these flights

Below is the Consolidated company's production line. Eight PBY's are shown.



S. D. Planes Released For Sale to Allies; Hint 9 Million Order

LOOK! World's Smallest Portable Radio
Size only 3¾"x5¾"x4" and WEIGHS ONLY 2 LBS. complete with batteries—self contained loop—NO AERIAL—NO GROUND! Dynamic speaker, Transformer A.F. stage & multi-purpose tubes—hi gain type. Can actually be carried in your coat pocket! Receives local and semidistant stations. Strong, neat, waterproof airplane cloth covered case. The first REALLY portable radio that won't break your arm to carry it! Costs little to operate—uses cheap flashlight batteries! Just the thing for picnics, bedrooms, offices, games, etc. OPERATES WHILE WALKING—ANYWHERE!
SEND ONLY $1.00 (currency, M.O., Check) and pay postman $8.95 plus postage on arrival. Sent absolutely complete ready to play the moment you get it! LESS WEIGHT, cost, size and upkeep—highest value! Order your midget today! GUARANTEED!
MIDGET RADIO CO. Dept. PA-3 KEARNEY, NEBR.

DO YOU WANT A JOB IN AVIATION?
IF YOU DO, the Luscombe School of Aeronautics can train you to take advantage of the better paid positions in the aircraft industry.
By obtaining the proper foundation for your future career at Luscombe, you are assured of the logical advancement that comes as a result of thorough and modern preparation. WRITE FOR DETAILS IMMEDIATELY and let us explain how we can put YOU in aviation. A free copy of "Opportunity in Aviation" and our School Paper, the "Luscombe Highlight" will be mailed to you.
Next Class Starts April 1, 1940
Featuring a ONE YEAR GOVERNMENT APPROVED COURSE leading to an A.&E. License or to Specialization in Factory Production of Modern Airplanes.
OVER 90% OF OUR GRADUATES PLACED

Remarkable Boat

(*Continued from page* 30)

minutes (the present record) was required by 15 PBY's led by the same Lieutenant-Commander LaHache last June. And Coco Solo, 3,087 miles away, has been reached from San Diego in only 22 hours, 20 minutes, by a 14-plane squadron. These feats by no means exhaust the admirable potentialities of the PBY-type.

Fletcher Pratt, the eminent Naval expert, is authority for the astounding, virtually unbelievable revelation that a PBY, in the 1939 Caribbean maneuvers, remained in the air *three days continuously,* traveling 15,000 miles as it kept on the tail of the "enemy" fleet. Just how this was accomplished has not been disclosed, officially or unofficially, as the PBY's 1,700-gallon gasoline capacity allows a non-stop range of only 4,200 miles. Were extra tanks installed in the hull? Was the working crew reduced to save weight? The Navy has not confirmed this sensational report, but if any element of truth exists in it, startling are the possibilities of day-and-night scouting thousands of miles from the United States.

Meanwhile, a private citizen—the wealthy Standard Oil heir, Richard Archbold—and the flight crew of his $250,000 "Guba", showed the Navy what terrific punishment its patrol planes will take under the most severe flying conditions conceivable and in widely varying climes. Archbold and his chief pilot, Russ Rogers, were the first to fly non-stop across the United States in a seaplane. This was done in the "Guba" on June 24-25, 1937—from San Diego to New York, 2,700 miles, in 17 hours, 3 minutes. And, to prove this could be made as much a routine as the Navy's ocean hops, Archbold did it again the following December—San Diego to Miami, 2,300 miles, in 14 hours, 10 minutes. He did it still a third time, again to Miami, on Feb. 26, 1938, in the creditable time of 12 hours, 35 minutes.

After due consideration of these performances, the Navy decided they were not mere stunts and had tremendous tactical value. They sent one of their own ships across—not quite as far, but nevertheless on a transcontinental trip, from San Diego to Pensacola. This has been done several times since with individual PBY's, the Navy having yet to risk a mass flight of seaplanes across the nation.

Aviation experts will tell you this is not as hazardous as it appears at first. There are plenty of sufficiently large water bodies to accommodate a PBY in an emergency during a transcontinental crossing. These water bodies, they will assure you, are closer together than emergency landing fields capable of harboring today's giant transports or Army bombers.

All this was done by Mr. Archbold in the same "Guba". There have been two "Gubas" (the name is native Papuan for "Sudden Storm"), with the first one purchased by the Russian government for Sir Hubert Wilkins shortly after the initial cross-country trip to New York in 1937. In this craft and with the Archbold flight crew, Wilkins searched for the Russian ace, Levanevsky, and his lost shipmates in the polar regions north of Latitude 80. The manner in which this airboat performed again found keen interest among Navy officials. Nineteen thousand miles were covered in flights of tremendous non-stop distances. To the 1,700 gallons of gas contained in the wings were added a large quantity in drums carried within the hull. This, in addition to the bulky supplies and equipment and the heavy drag of ice coatings on wings and tail surfaces, at times put the boat to tests possibly more severe than any ever administered under normal operating conditions.

A startling sample of the PBY-type's versatility was again afforded by Archbold, in the second "Guba", acquired after he disposed of Number One to the Soviet Union. This ship, perhaps the most famous privately-owned airplane in the world, has an amazing record of "firsts" to its credit. In its use as a transport for an American Museum of Natural History expedition in Netherlands New Guinea, and as a survey ship for a new commercial route planned by the Australian government, it accomplished the following:

1. First to fly from Guam to Netherlands New Guinea, 1,900 miles.
2. First to operate from a lake 11,500 feet above sea level (Lake Habbema in Netherlands New Guinea), where dozens of landings and take-offs were made in rarefied air that deprived the two 1,000 h.p. Pratt & Whitney engines of almost half their power.
3. First airboat to span the Australian continent non-stop, 2,200 miles from Sydney to Port Hedland.
4. First airboat to cross the Indian Ocean, 5,400 miles from Port Hedland to Mombasa, Africa, on a survey flight for the Australian government to demonstrate feasibility of a new commercial air route.

S. D. Planes Released For Sale to Allies; Hint 9 Million Order

TRIB 3-14-40

By HAROLD OSBORNE

The drone of bombers over riddled Poland, which led to declaration of war by the allies, echoed at San Diego today with an announcement by Consolidated Aircraft Corp. officials confirming Washington, D. C., reports that Consolidated PBY-type planes have been released for the allies use. The "blitzkrieg" of last September has resulted in "substantial orders from abroad" being received by Consolidated, it was reported.

First official word that Consolidated planes were contemplated for sale to certain European powers came in a United Press dispatch quoting Rear Adm. John H. Towers, chief of the navy

(Continued on Page 4A, Col. 3)

Release S. D. Planes For Sale to Allies

CONTINUED FROM PAGE ONE

bureau of aeronautics, as saying that "four types of navy planes have been or will be released to the allies by the joint army-navy aeronautical board." He said they were the Vought FB2U and the twin-engined Consolidated PBY flying boats, the Brewster fighter, and Grumman monoplane fighter, all of which have been stripped of secret equipment, such as bomb sights.

Silent on Details

A Consolidated spokesman confirmed the statement that the firm here has received from the government a release for export sale of the PBY planes, and said "we are well along in the early stages of construction." He declined to announce the number of planes being built, for what nation they were consigned, or the price of the contract, which is believed to be nearly $9,000,000.

The "guess" on the contract price for the foreign order is based on the annual report of Consolidated, released last week, which revealed the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 previously announced. While Consair officials refused to comment on the $9,000,000, authoritative sources said it involved orders by a foreign nation or nations.

Flight Records Set

The PBY-type planes are those used by the American navy as patrol bombers, and have established many group distance flight records, notably from San Diego to Panama and Hawaii, and from Hawaii to the Philippines. Soon after delivery of the first plane of the PBY series a few years ago it established a new international distance record of 3443 miles in a flight from Coco Solo, C. Z., to Alameda. Subsequent refinements have extended the range beyond 4000 miles, and in 1937-38 alone the navy made three "routine delivery flights" of 42 PBY planes from here to Hawaii, a distance of more than 2500 miles, and two "routine deliveries" of 26 planes from here to Coco Solo, 3000 miles. Last year the planes flew from San Diego to the Caribbean sea for United States fleet exercises.

The PBY's are the world's longest-range two-engine flying boats, and their speed exceeds 200 miles an hour. One PBY, the Guba, owned by Richard Archbold, aerial scientist, flew around the world after being used 10 months in New Guinea scientific exploration operations. A commercial PBY was flown by Sir Hubert Wilkins over 19,000 miles of Arctic wastes under the most adverse weather conditions, in search of the lost Russian transpolar fliers headed by Sigismund Leavaneffsky. Ability of the planes to "take it" were demonstrated in special single-engine take-off tests, which proved it was possible for a PBY to take off with only one engine with sufficient fuel to continue flying a distance of more than 1300 miles. Consolidated officials said it is believed this feat is unequalled in flying boat history.

Effect of the allied order for the planes, coming after $40,000,000 in American army and navy planes had been placed with Consolidated, is reflected in increased employment. Maj. R. H. Fleet, Consair head, said in the annual report that 4300 are working at the plant in three shifts, and that approximately 100 men a week are being added.

PBY statistics show a maximum range of 4200 miles, a service ceiling of more than 29,000 feet, the ability to climb to 15,000 feet in 13.4 minutes, and full speed at 12,000 feet, 194 miles an hour.

Steel Arrives For Consair's New Buildings

UNION 3-15-40

By HOWARD MORIN

Laden to the plimsoll mark with steel for the Consolidated Aircraft Co.'s new buildings, canned goods and general merchandise for other Pacific coast ports, American-Hawaiian line steamer American will dock at the B st. pier tonight from Baltimore and Philadelphia. The fabricated steel is but part of shipments arriving by rail and water from Pennsylvania steel mills for Consolidated's expansion building program.

The Quaker line will have two intercoastal steamers in port over the week-end. Westbound, the San Rafael is due tomorrow from eastern ports with 350 tons local cargo. The Peter Kerr is to berth at B st. pier Sunday to load 350 tons kelp meal, canned goods and beans for eastern markets.

UNION 3-15-40

Foundations Laid For Navy Buildings

Consolidated Aircraft Co. officials announced yesterday that foundations for the group of new buildings, which will virtually double capacity of the plant, have been completed.

Construction of the addition to the experimental building has started, and steel rapidly is being delivered for the other structures. All of the new structures will be in use by June 1.

Officials said that authority has been received from the government to export the company's PBY-type planes, of which a number already has been sold to foreign governments.

DATE 29 FEB 1940

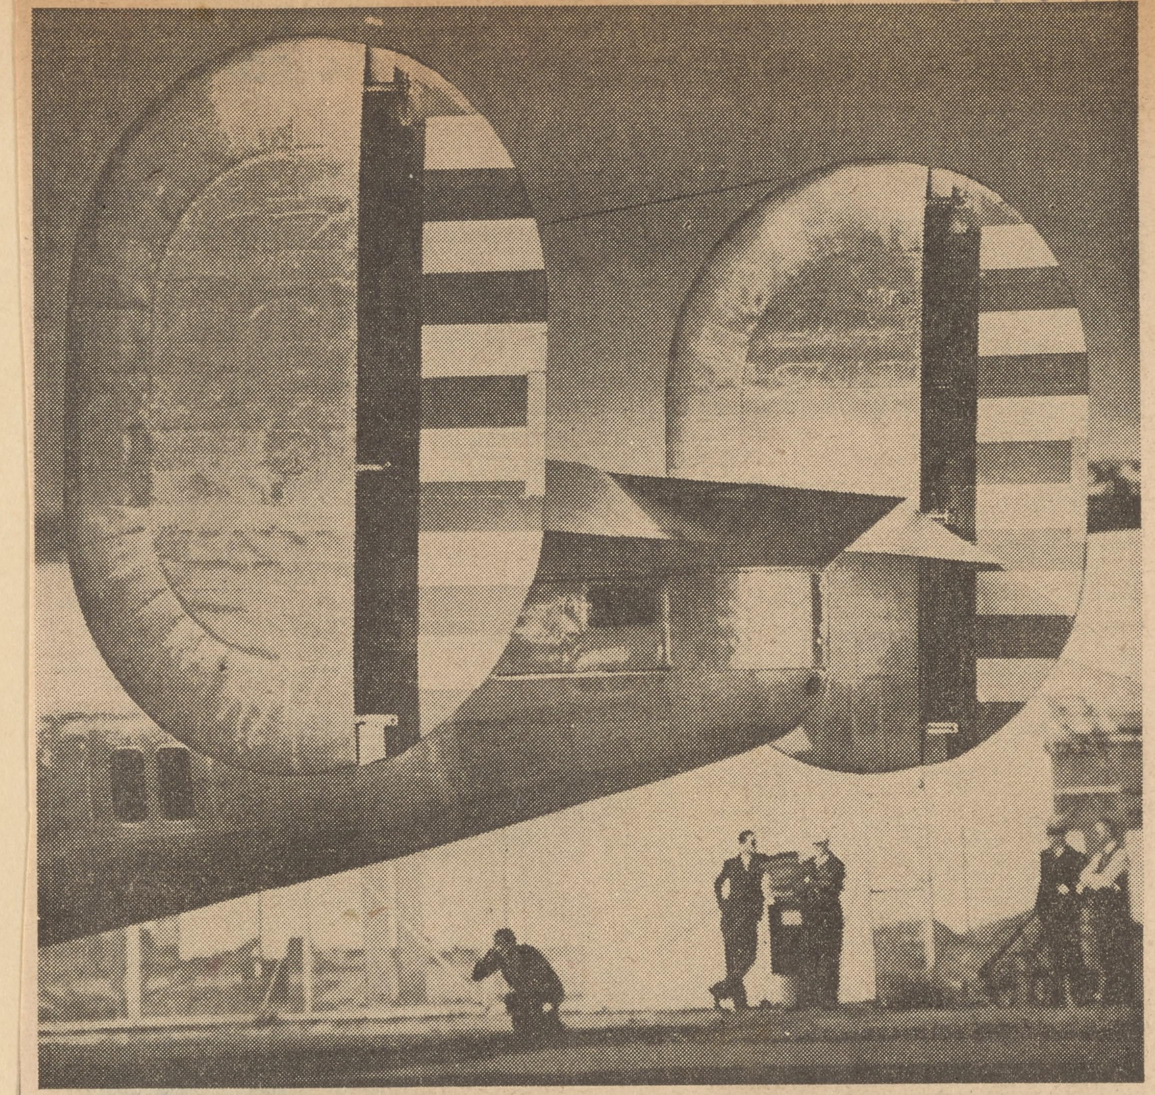
Consolidated Factory Expansion

ANNOUNCEMENT was made by the Navy Department on December 20 that the Consolidated Aircraft Corporation had been awarded a contract for $20,016,699. This is the largest single order for aeroplanes ever placed by the United States Government, and it increased the backlog of Consolidated to over $40,000,000. With work on other contracts occupying most of the production capacity, the new record order has made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

The building expansion will aggregate approximately 396,000 sq. ft., or an increase in the present area of 87 per cent. The largest single area to be roofed is the new final assembly building measuring 360 feet by 720 feet. This has a clear span of 120 feet and a clearance from floor to roof truss bottoms of 36 feet. In addition to the buildings, all factory yard areas will be paved with asphaltic concrete. These areas, due to the mild southern Californian climate, can be used virtually the entire year round for final assembly operations.

MAMMOTH ARMY WARBIRD DWARFS HUMANS

UNION 3-17-40



The huge size of the Consolidated-built new army bomber XB-24 is shown by the height of the two rudders. The plane, soon to be flown to Dayton, O., for final army tests, weighs 24 tons, carries a crew of nine and can fly 3000 miles with four tons of bombs.

THREE S. D. AIRCRAFT PLANTS MAY BE FORCED TO EXPAND

Business Volume Biggest in History; Foreign Orders Boost Local Backlogs

By HOWARD MORIN

San Diego's aircraft manufacturers, working at top speed on orders exceeding $50,000,000, may have to continue their expansion program.

The three Lindbergh field plants, Consolidated, Ryan and Solar, whose total personnel by midsummer will exceed 9000, will be will be vitally affected by the action of the British and French governments in purchasing nearly a billion dollars' worth of new American warplanes.

ORDERS MAY DOUBLE

Consolidated Aircraft Corp., whose backlog of foreign and domestic orders is the largest in the company's history, is negotiating with the British and French purchasing commission, authorities said. Consolidated's current foreign orders for $9,000,000 in planes and spare parts is expected to be doubled or tripled as a result of negotiations under way.

The Ryan and Solar plants probably will be called upon to manufacture special equipment for the 8000 planes which the French and British are planning to have built in American aircraft factories.

HUGE BAGKLOG

The American aircraft industry consists of 45 plane and 13 engine manufacturing plants. Of these 23 plane and nine engine plants are working on military orders. According to the aeronautical chamber of commerce, their current backlog totals $500,000,000.

Despite the tremendous expansion program which has resulted in doubling the facilities of San Diego's aircraft factories, American plane plants occupy a relatively unimportant place in the nation's industrial structure. Sixty thousand persons are on aircraft shop payrolls compared to 600,000 on automotive plant and related industry payrolls.

Since President Roosevelt proclaimed a state of "limited national emergency," the secrecy that has surrounded the aircraft manufacturing industry is equaled only by that of shipyards building new warships for the navy. Few industries have as many government-imposed restrictions. The factories are honeycombed with military and navy inspectors and government agents. Yet no other industry is so fearful of the results of over-expansion, a fear that has dictated extreme caution in adding to its backlog.

SET FOR SLUMP

Local aircraft manufacturers are keenly alive to the fact there will be a slump at the end of the war, but they are taking extraordinary precautions to avoid major lay-offs when this time comes. They are attuned primarily to the growing needs of American aviation, military, navy and commercial, and only in a limited way to foreign markets. They say emphatically that the three local plants are not "war babies." In fact they are anything but that. They were operating on a substantial basis long

(Continued on Page 2-A, Col. 3)

Business Volume May Force Plane Plant Expansion

(Continued from Page 1)

before the allies and Germany went to war.

To legislation establishing airlines which buy from aircraft and aircraft engine makers, and to millions of dollars in orders from the American armed forces over a long period is attributed the present prosperity of the industry, and particularly the three local plants.

EXPANSION PRE-ARRANGED

Lindbergh field plane manufacturers explain that long before orders from foreign governments began to pour in after the war started, plans had been perfected for plant expansion. Leases for additional tidelands to meet increased building programs were sought and obtained from the harbor department. The need for additional shop and assembly space became apparent when Americans, in constantly increasing numbers, began taking to the air.

A striking example of this is the official government announcement that commercial and military planes worth $40,000,000 are produced each month from American factories. By mid-June it is estimated the monthly productions will be valued at $55,000,000.

On domestic commercial and on foreign commercial and military orders, profits of manufacturers are limited to 12 percent under the Vinson-Trammell act when dealing with the U. S. government, and only by their shrewdness when doing business with foreign buyers. Nevertheless the government maintains an effective check on foreign shipments by permitting only certain types to be exported.

FUTURE CONSIDERED

Because the prosperity of the industry depends fundamentally on decisions of many governmental agencies and congressional appropriations, most manufacturers are extremely chary of expanding their plants unless they are reasonably sure of future orders that are not dependent primarily on continuation of the European war.

In line with this policy San Diego's aircraft factories are exceedingly fortunate, as less than $10,000,000 of the total $50,000,000 backlog is for foreign contracted planes.

Less than 15 years ago San Diego's aircraft industry was confined to manufacturing and flying operations of one company.

Today the industry's payroll runs into millions of dollars annually and planes are produced that literally traverse the world's skyways. Backlogs are building up. And there is every indication they will continue, officials say, for transportation by air is getting safer, swifter and more exhilarating with every new model produced by American engineers.

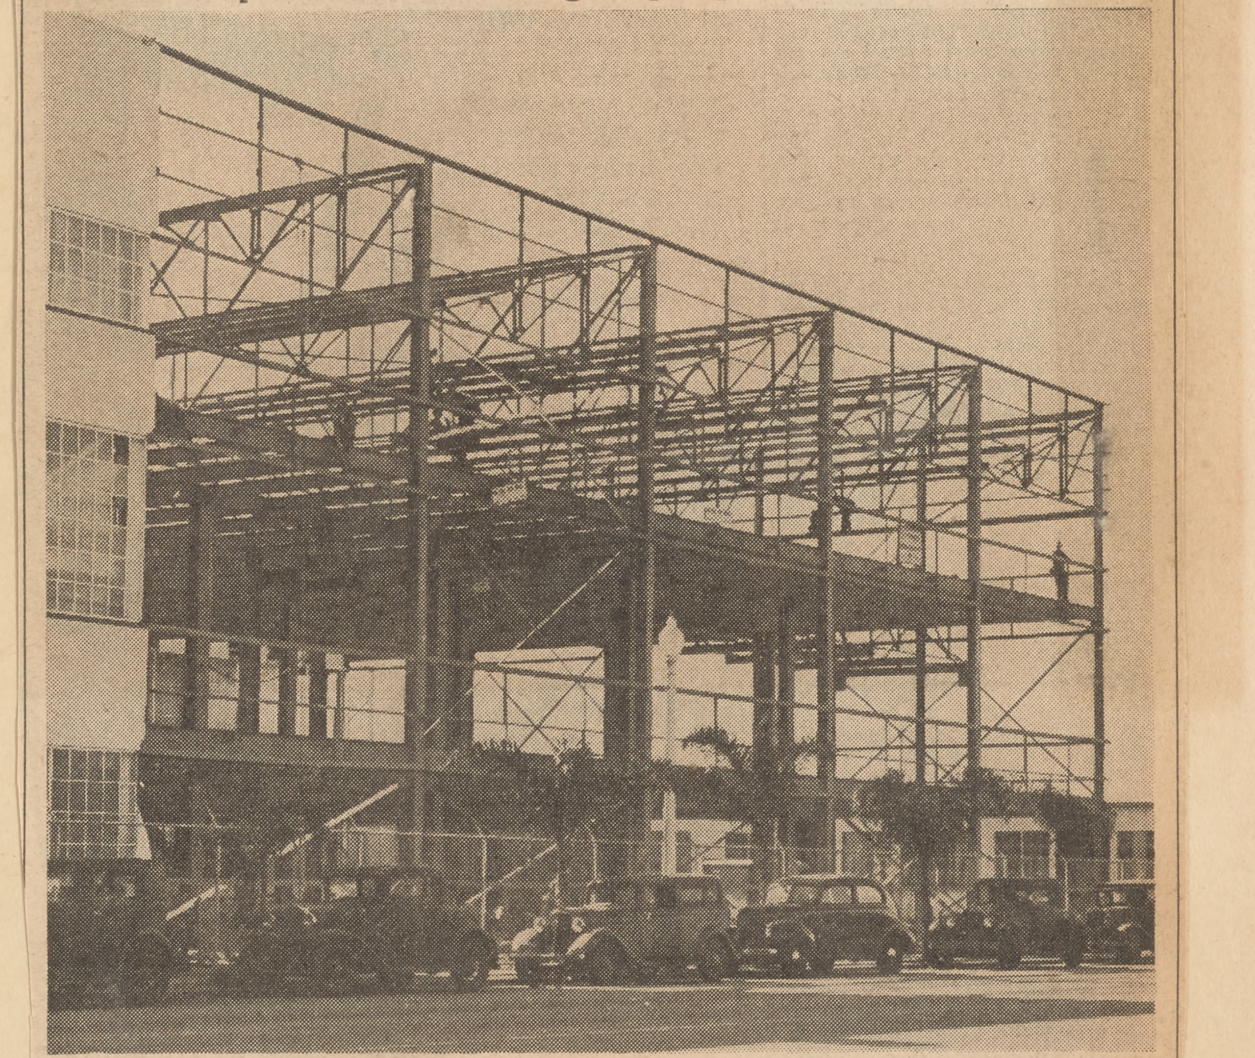
UNION 3-17-40

GROUP DISCUSSES NEEDS OF CONSERVATION CORPS

Educators, industrialists and CCC officials at an educational conference here included (seated, left to right) William P. Mayer, outdoors relief superintendent; Mrs. Ada York Allen, county schools superintendent; Harry Webster, CCC soliciting aid; (standing, left to right) Dean A. G. Peterson, State college; Dayton E. Jones, state superintendent, CCC selecting; John Waller, district education adviser; J. H. Waterbury, assistant personnel superintendent, Consolidated Aircraft Corp., and Raymond H. Hinkel, work relief superintendent.

Consair's Experimental Building Rapidly Taking Form

TRIB 3-16-40



Steel framework of the addition to Consolidated Aircraft Corp.'s experimental building on Pacific highway, is rising rapidly as the firm pushes its expansion program occasioned by new army, navy and foreign orders. In addition to the framework shown here, foundations have been completed for a group of new buildings at the plant. Forty-eight tons of steel for the buildings arrived here last night aboard the American-Hawaiian intercoastal freighter American.

in Aviation Radio

Spartan GRADUATES ARE IN THE Air AND ON THE Ground

AMONG graduates of Spartan Courses in Radio Engineering and Operation, Walter P. Hottel is now radio operator for American Air Lines; Charles S. Feast, radio engineer with Aeronautical Radio, Long Island, New York; with the Glenn L. Martin Company as radio electricians are Stanley L. Rankin, Paul L. Wilmes and Forrest Whitham; Herbert J. Smith is radio operator at The Bureau of Air Commerce weather station at Saltillo, Texas; Vernon Hull, Postal Telegraph manager at Xenia, Ohio; John Crisford, Mid-Continent Air Lines radio operator at Kansas City.

SPARTAN TRAINING has enabled these young men to step into positions of responsibility with companies outstanding in the Aviation Industry—training that companies such as these recognize. SPARTAN TRAINING will give YOU the opportunity for a fine position at good pay—the tools of experience that will be the full measure of your success.

AERO FIRE PREVENTION

It is proper and wise that airplane fire risks be faced squarely, their causes studied and precautions taken to minimize them. The Aero Insurance Underwriters have made a careful study of air safety, particularly relating to fire and fire hazards. Jerome Lederer, Chief Engineer of the Aero Insurance Underwriters, brings the findings of their study to the readers of POPULAR AVIATION. Don't miss this informative article in the

APRIL ISSUE

POPULAR AVIATION

ON SALE MARCH 10

(*Continued from page* 80)

5. First to fly from the west coast of Africa to the Virgin Islands, making it holder of the world's record for non-stop over-water flying, 3,300 miles on this jump.

6. First airboat to circumnavigate the globe the longest way—25,000 miles—with San Diego as the starting and ending point.

When Russ Rogers and company returned to San Diego last July they stepped out of the "Guba" and into another Model 28, with markings of the British Royal Air Force on its wing and hull. In this they demonstrated to the United States Navy another stunning possibility—easily accomplished flights of bombers across the Atlantic between Europe and the North American continent. They took the PBY replica, which the English government bought for experimental purposes with a view to possible large-scale production, from San Diego to Buffalo, N. Y., then to Botwood, Newfoundland, and finally directly across to Felixstowe, marine aircraft experimental establishment of the Royal Air Force on the North Sea.

That gave the Navy experts plenty of food for thought, not only as to the ability of the PBY. A horde of bombers flying in the opposite direction could no longer be considered as pure fancy. There is irony in the sale of a PBY to England. Glowering at Great Britain from the other side of the diplomatic fence is Russia which also boasts not only a PBY but a complete set of plans and tools for the mass production of these airboats. In 1937, Consolidated sent a corps of 10 engineers to Taganrog, Russia, on the Sea of Azov, where the technique of American manufacturing was introduced at a huge plant. Preceding the technicians were a complete PBY, parts for another and the design and tools. The enigmatic Russians claimed the ships were to be used for commercial, cargo-carrying purposes. Yes, it was all done with the consent of the U. S. Navy, whose strategists are well aware of the fact that Alaska is not too comfortably distant from Siberia.

The Atlantic was transversed half a dozen times last summer by another Model 28, purchased by American Export Airlines for survey flights preparatory to establishing a regular service.

American aviation knows no more glorious chapter than the military and commercial saga of the PBY-type flying boat. And from it greater developments have sprung. There is the mighty four-engined XPB2Y-1, several of which are under construction for the Navy, and the experimental twin-motored (2,000 h.p. Wright *Cyclones* each, the largest ever installed in a plane) Model 31, said to be the fastest and longest-range airboat in the world.

But engineers are looking beyond these, to the other side of the horizon, where the flying wing is awaiting practical application. As for the airplane of tomorrow, based on proved principles of design and construction, the PBY's chief engineer, I. M. Laddon, has this to say:

"It will carry up to 300 passengers with baggage, mail and baggage, or mail and express and have a range sufficient to cross any ocean or continent with a safe reserve of fuel. Flying at well over 300 m.p.h. in the stratosphere where ideal conditions for smooth, fast flight exist, the passenger will find a modern expression of the fundamental urge to travel, in keeping with an age of speed."

END

It Takes Headlines

(*Continued from page* 53)

tion announced some ground schools in the Wisconsin vocational schools, the W.C.A.C. wrote the district NYA supervisor offering corps members as volunteer speakers and equipment for part time use. That also got publicity and it was a worthy public service.

When the Community Chest drive starts let your organization offer a couple of planes to fly signs over the city. Organize a speakers bureau and let the various civic clubs know that the emminent attorney, Joe Doakes, is a member of the Whoosis Aviation club and he'll be glad to talk free at one of their noon luncheons. Send your speakers before high school and grade school assemblies, to Boy Scout and Girl Scout meetings, down to the Y.M.C.A. You'll be amazed how gladly they will be received.

If possible, get an unusual twist on your normal activities. That makes for news. For example, the W.C.A.C. planned a navigation race from Milwaukee to Kohler, Wis., back to West Bend, Wis., and then into the Curtiss-Wright airport at Milwaukee. Normally that would have been worth maybe two paragraphs in the newspapers—one to announce the race was to be held, another telling the winners. Some wise member of the corps remembered the state and nation was wrought up over the dual Thanksgivings; one on November 23 for FDR, the other on November 30 for the Republican governors.

So the group announced a Turkey Day race to be held the Sunday before Thanksgiving the First with turkeys, geese, ducks and chickens (all donated) for prizes and got themselves a couple of good feature stories.

At the annual hobby show in Milwaukee's huge auditorium, the same organization carted a small plane from an airport through the downtown streets, set it up along with other things as an exhibit and kept someone on duty to explain controls, struts and whatnot to the thousands who saw the hobby show.

The possibilities for legitimate publicity for your aviation organization are bounded only by your imagination and the worthwhileness of your activities. But remember—only *good* publicity is news.

END

Government Sailplane

THE first sailplane ever to be ordered directly by the U. S. Government recently was delivered to a Government soaring school project at Cassidy Lake, Michigan. The sailplane was completed 19 days after the order was received, although the order itself called for 30-day delivery. The ship was built by the Bowlus Sailplane Company, San Fernando, Cal.

bureau of aeronautics, as saying that "four types of navy planes have been or will be released to the allies by the joint army-navy aeronautical board." He said they were the Vought FB2U and the twin-engined Consolidated PBY flying boats, the Brewster fighter, and Grumman monoplane fighter, all of which have been stripped of secret equipment, such as bomb sights.

Silent on Details

A Consolidated spokesman confirmed the statement that the firm here has received from the government a release for export sale of the PBY planes, and said "we are well along in the early stages of construction." He declined to announce the number of planes being built, for what nation they were consigned, or the price of the contract, which is believed to be nearly $9,000,000.

The "guess" on the contract price for the foreign order is based on the annual report of Consolidated, released last week, which revealed the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 previously announced. While Consair officials refused to comment on the $9,000,000, authoritative sources said it involved orders by a foreign nation or nations.

Flight Records Set

The PBY-type planes are those used by the American navy as patrol bombers, and have established many group distance flight records, notably from San Diego to Panama and Hawaii, and from Hawaii to the Philippines. Soon after delivery of the first plane of the PBY series a few years ago it established a new international distance record of 3443 miles in a flight from Coco Solo, C. Z., to Alameda. Subsequent refinements have extended the range beyond 4000 miles, and in 1937-38 alone the navy made three "routine delivery flights" of 42 PBY planes from here to Hawaii, a distance of more than 2500 miles, and two "routine deliveries" of 26 planes from here to Coco Solo, 3000 miles. Last year the planes flew from San Diego to the Caribbean sea for United States fleet exercises.

The PBY's are the world's longest-range two-engine flying boats, and their speed exceeds 200 miles an hour. One PBY, the Guba, owned by Richard Archbold, aerial scientist, flew around the world after being used 10 months in New Guinea scientific exploration operations. A commercial PBY was flown by Sir Hubert Wilkins over 19,000 miles of Arctic wastes under the most adverse weather conditions, in search of the lost Russian transpolar fliers headed by Sigismund Leavaneffsky. Ability of the planes to "take it" were demonstrated in special single-engine take-off tests, which proved it was possible for a PBY to take off with only one engine with sufficient fuel to continue flying a distance of more than 1300 miles. Consolidated officials said it is believed this feat is unequalled in flying boat history.

Effect of the allied order for the planes, coming after $40,000,000 in American army and navy planes had been placed with Consolidated, is reflected in increased employment. Maj. R. H. Fleet, Consair head, said in the annual report that 4300 are working at the plant in three shifts, and that approximately 100 men a week are being added.

PBY statistics show a maximum range of 4200 miles, a service ceiling of more than 29,000 feet, the ability to climb to 15,000 feet in 13.4 minutes, and full speed at 12,000 feet, 194 miles an hour.

Steel Arrives For Consair's New Buildings

UNION 3-15-40

By HOWARD MORIN

Laden to the plimsoll mark with steel for the Consolidated Aircraft Co.'s new buildings, canned goods and general merchandise for other Pacific coast ports, American-Hawaiian line steamer American will dock at the B st. pier tonight from Baltimore and Philadelphia. The fabricated steel is but part of shipments arriving by rail and water from Pennsylvania steel mills for Consolidated's expansion building program.

The Quaker line will have two intercoastal steamers in port over the week-end. Westbound, the San Rafael is due tomorrow from eastern ports with 350 tons local cargo. The Peter Kerr is to berth at B st. pier Sunday to load 350 tons kelp meal, canned goods and beans for eastern markets.

Foundations Laid For Navy Buildings

Consolidated Aircraft Co. officials announced yesterday that foundations for the group of new buildings, which will virtually double capacity of the plant, have been completed.

Construction of the addition to the experimental building has started, and steel rapidly is being delivered for the other structures. All of the new structures will be in use by June 1.

Officials said that authority has been received from the government to export the company's PBY-type planes, of which a number already has been sold to foreign governments.

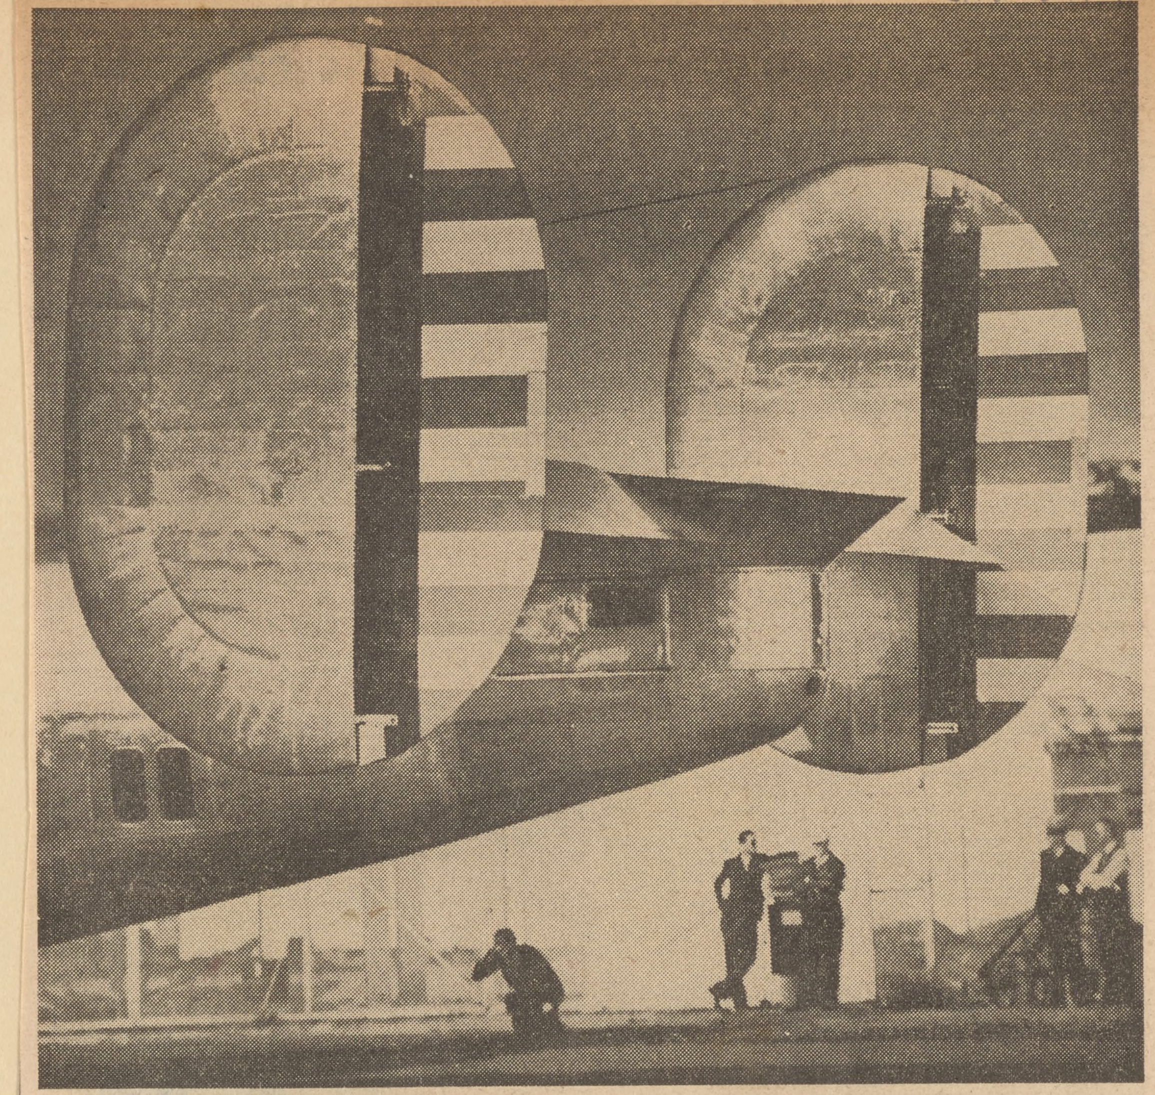
Consolidated Factory Expansion

ANNOUNCEMENT was made by the Navy Department on December 20 that the Consolidated Aircraft Corporation had been awarded a contract for $20,016,699. This is the largest single order for aeroplanes ever placed by the United States Government, and it increased the backlog of Consolidated to over $40,000,000. With work on other contracts occupying most of the production capacity, the new record order has made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

The building expansion will aggregate approximately 396,000 sq. ft., or an increase in the present area of 87 per cent. The largest single area to be roofed is the new final assembly building measuring 360 feet by 720 feet. This has a clear span of 120 feet and a clearance from floor to roof truss bottoms of 36 feet. In addition to the buildings, all factory yard areas will be paved with asphaltic concrete. These areas, due to the mild southern Californian climate, can be used virtually the entire year round for final assembly operations.

MAMMOTH ARMY WARBIRD DWARFS HUMANS

UNION 3-17-40



The huge size of the Consolidated-built new army bomber XB-24 is shown by the height of the two rudders. The plane, soon to be flown to Dayton, O., for final army tests, weighs 24 tons, carries a crew of nine and can fly 3000 miles with four tons of bombs.

THREE S. D. AIRCRAFT PLANTS MAY BE FORCED TO EXPAND

Business Volume Biggest in History; Foreign Orders Boost Local Backlogs

By HOWARD MORIN

San Diego's aircraft manufacturers, working at top speed on orders exceeding $50,000,000, may have to continue their expansion program.

The three Lindbergh field plants, Consolidated, Ryan and Solar, whose total personnel by midsummer will exceed 9000, will be will be vitally affected by the action of the British and French governments in purchasing nearly a billion dollars' worth of new American warplanes.

ORDERS MAY DOUBLE

Consolidated Aircraft Corp., whose backlog of foreign and domestic orders is the largest in the company's history, is negotiating with the British and French purchasing commission, authorities said. Consolidated's current foreign orders for $9,000,000 in planes and spare parts is expected to be doubled or tripled as a result of negotiations under way.

The Ryan and Solar plants probably will be called upon to manufacture special equipment for the 8000 planes which the French and British are planning to have built in American aircraft factories.

HUGE BAGKLOG

The American aircraft industry consists of 45 plane and 13 engine manufacturing plants. Of these 23 plane and nine engine plants are working on military orders. According to the aeronautical chamber of commerce, their current backlog totals $500,000,000.

Despite the tremendous expansion program which has resulted in doubling the facilities of San Diego's aircraft factories, American plane plants occupy a relatively unimportant place in the nation's industrial structure. Sixty thousand persons are on aircraft shop payrolls compared to 600,000 on automotive plant and related industry payrolls.

Since President Roosevelt proclaimed a state of "limited national emergency," the secrecy that has surrounded the aircraft manufacturing industry is equaled only by that of shipyards building new warships for the navy. Few industries have as many government-imposed restrictions. The factories are honeycombed with military and navy inspectors and government agents. Yet no other industry is so fearful of the results of over-expansion, a fear that has dictated extreme caution in adding to its backlog.

SET FOR SLUMP

Local aircraft manufacturers are keenly alive to the fact there will be a slump at the end of the war, but they are taking extraordinary precautions to avoid major lay-offs when this time comes. They are attuned primarily to the growing needs of American aviation, military, navy and commercial, and only in a limited way to foreign markets. They say emphatically that the three local plants are not "war babies." In fact they are anything but that. They were operating on a substantial basis long

(Continued on Page 2-A, Col. 3)

Business Volume May Force Plane Plant Expansion

(Continued from Page 1)

before the allies and Germany went to war.

To legislation establishing airlines which buy from aircraft and aircraft engine makers, and to millions of dollars in orders from the American armed forces over a long period is attributed the present prosperity of the industry, and particularly the three local plants.

EXPANSION PRE-ARRANGED

Lindbergh field plane manufacturers explain that long before orders from foreign governments began to pour in after the war started, plans had been perfected for plant expansion. Leases for additional tidelands to meet increased building programs were sought and obtained from the harbor department. The need for additional shop and assembly space became apparent when Americans, in constantly increasing numbers, began taking to the air.

A striking example of this is the official government announcement that commercial and military planes worth $40,000,000 are produced each month from American factories. By mid-June it is estimated the monthly productions will be valued at $55,000,000.

On domestic commercial and on foreign commercial and military orders, profits of manufacturers are limited to 12 percent under the Vinson-Trammell act when dealing with the U. S. government, and only by their shrewdness when doing business with foreign buyers. Nevertheless the government maintains an effective check on foreign shipments by permitting only certain types to be exported.

FUTURE CONSIDERED

Because the prosperity of the industry depends fundamentally on decisions of many governmental agencies and congressional appropriations, most manufacturers are extremely chary of expanding their plants unless they are reasonably sure of future orders that are not dependent primarily on continuation of the European war.

In line with this policy San Diego's aircraft factories are exceedingly fortunate, as less than $10,000,000 of the total $50,000,000 backlog is for foreign contracted planes.

Less than 15 years ago San Diego's aircraft industry was confined to manufacturing and flying operations of one company.

Today the industry's payroll runs into millions of dollars annually and planes are produced that literally traverse the world's skyways. Backlogs are building up. And there is every indication they will continue, officials say, for transportation by air is getting safer, swifter and more exhilarating with every new model produced by American engineers.

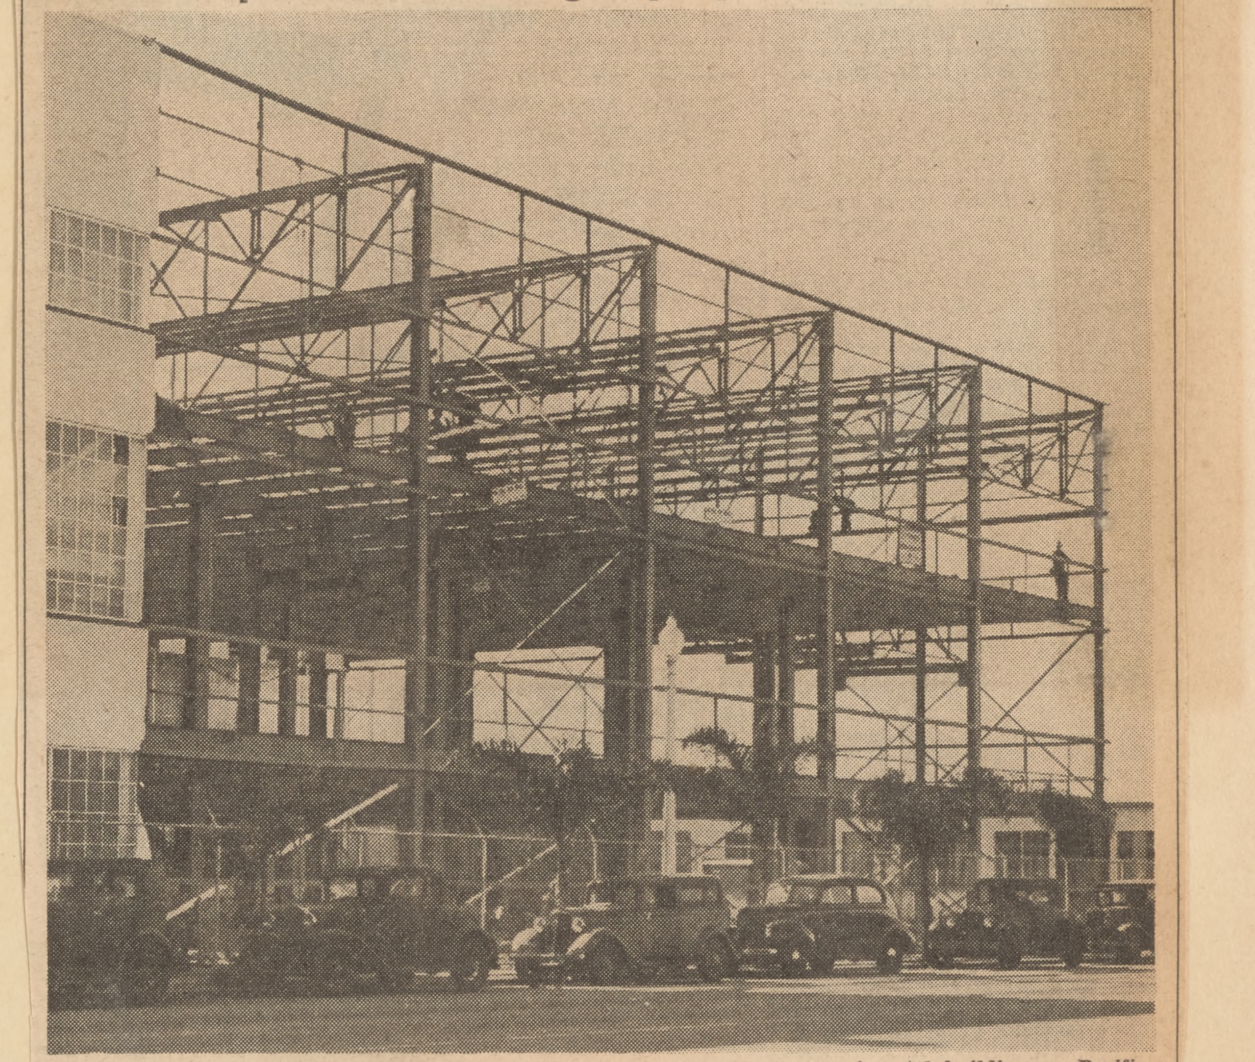
Consair's Experimental Building Rapidly Taking Form

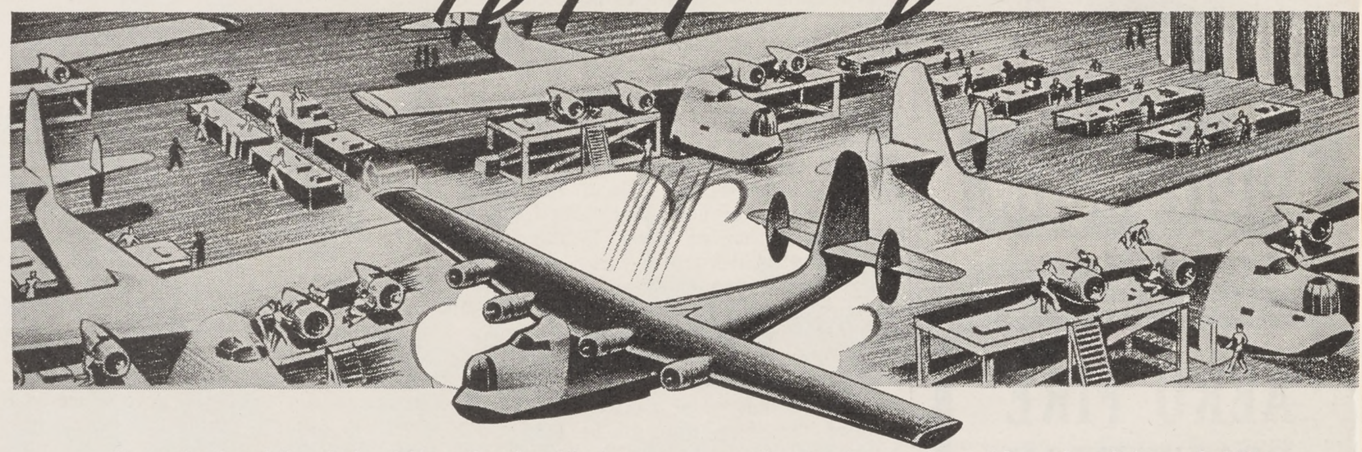
TRIB
3-16-40



Steel framework of the addition to Consolidated Aircraft Corp.'s experimental building on Pacific highway, is rising rapidly as the firm pushes its expansion program occasioned by new army, navy and-foreign orders. In addition to the framework shown here, foundations have been completed for a group of new buildings at the plant. Forty-eight tons of steel for the buildings arrived here last night aboard the American-Hawaiian intercoastal freighter American.

How would YOU like to be with these fellows

—Now building flying boats for Uncle Sam



No wonder these fellows had such big smiles when this picture was taken. The very next day they reported for work with a famous builder of huge flying boats and other great aircraft for the Army, Navy, and airlines.

Wouldn't YOU be happy over such a top-notch start on an Aviation career . . . to step right into aircraft production scenes like those you see pictured here . . . to have the privilege of helping build some of the world's largest and finest aircraft . . . to know you had entered a line of work where progress depends only on yourself?

Like these fellows, you could also take pride in a choice of training that won you a start in Aviation . . . training that would continue to give you the confidence, knowledge, and ability to push steadily ahead.

That is the brand of training you get at Aero ITI . . . training so practical, so thorough, so closely paralleling actual aviation industry duties, that Aero ITI men are *sought-for*. Over 700 of this school's graduates have entered Aviation in the last year alone . . . proof that the industry *wants* Aero ITI-trained men.

At Aero ITI you can train for aircraft production, aircraft maintenance, or aeronautical engineering. For details, send the coupon NOW.

S. D. Planes Released For Sale to Allies; Hint 9 Million Order

TRIB 3-14-40

By HAROLD OSBORNE

The drone of bombers over riddled Poland, which led to declaration of war by the allies, echoed at San Diego today with an announcement by Consolidated Aircraft Corp. officials confirming Washington, D. C., reports that Consolidated PBY-type planes have been released for the allies use. The "blitzkrieg" of last September has resulted in "substantial orders from abroad" being received by Consolidated, it was reported.

First official word that Consolidated planes were contemplated for sale to certain European powers came in a United Press dispatch quoting Rear Adm. John H. Towers, chief of the navy

(Continued on Page 4A, Col. 3)

Release S. D. Planes For Sale to Allies

CONTINUED FROM PAGE ONE

bureau of aeronautics, as saying that "four types of navy planes have been or will be released to the allies by the joint army-navy aeronautical board." He said they were the Vought FB2U and the twin-engined Consolidated PBY flying boats, the Brewster fighter, and Grumman monoplane fighter, all of which have been stripped of secret equipment, such as bomb sights.

Silent on Details

A Consolidated spokesman confirmed the statement that the firm here has received from the government a release for export sale of the PBY planes, and said "we are well along in the early stages of construction." He declined to announce the number of planes being built, for what nation they were consigned, or the price of the contract, which is believed to be nearly $9,000,000.

The "guess" on the contract price for the foreign order is based on the annual report of Consolidated, released last week, which revealed the firm has a backlog of unfilled orders totaling $49,000,000, instead of the $40,000,000 previously announced. While Consair officials refused to comment on the $9,000,000, authoritative sources said it involved orders by a foreign nation or nations.

Flight Records Set

The PBY-type planes are those used by the American navy as patrol bombers, and have established many group distance flight records, notably from San Diego to Panama and Hawaii, and from Hawaii to the Philippines. Soon after delivery of the first plane of the PBY series a few years ago it established a new international distance record of 3443 miles in a flight from Coco Solo, C. Z., to Alameda. Subsequent refinements have extended the range beyond 4000 miles, and in 1937-38 alone the navy made three "routine delivery flights" of 42 PBY planes from here to Hawaii, a distance of more than 2500 miles, and two "routine deliveries" of 26 planes from here to Coco Solo, 3000 miles. Last year the planes flew from San Diego to the Caribbean sea for United States fleet exercises.

The PBY's are the world's longest-range two-engine flying boats, and their speed exceeds 200 miles an hour. One PBY, the Guba, owned by Richard Archbold, aerial scientist, flew around the world after being used 10 months in New Guinea scientific exploration operations. A commercial PBY was flown by Sir Hubert Wilkins over 19,000 miles of Arctic wastes under the most adverse weather conditions, in search of the lost Russian transpolar fliers headed by Sigismund Leavaneffsky. Ability of the planes to "take it" were demonstrated in special single-engine take-off tests, which proved it was possible for a PBY to take off with only one engine with sufficient fuel to continue flying a distance of more than 1300 miles. Consolidated officials said it is believed this feat is unequalled in flying boat history.

Effect of the allied order for the planes, coming after $40,000,000 in American army and navy planes had been placed with Consolidated, is reflected in increased employment. Maj. R. H. Fleet, Consair head, said in the annual report that 4300 are working at the plant in three shifts, and that approximately 100 men a week are being added.

PBY statistics show a maximum range of 4200 miles, a service ceiling of more than 29,000 feet, the ability to climb to 15,000 feet in 13.4 minutes, and full speed at 12,000 feet, 194 miles an hour.

Steel Arrives For Consair's New Buildings

Aircraft Corp. Backlog Soars

Consolidated Orders at $49,000,000 Set All-Time High Mark

Consolidated Aircraft Corp. of San Diego, in releasing its annual report yesterday disclosed that the backlog of unfilled orders had reached an all-time peak of $49,000,000, a volume sufficient to keep the plant busy until midsummer of 1941.

This represents an increase in the backlog of nearly $8,000,000 since the first of this year, the unfilled orders at the close of 1939 having been $42,141,694. The company stated that during the past few months it had received contracts from foreign customers for a released version of the PBY ship, a two-engine long-range navy patrol bomber.

PROFITS SHOWN

Net profits for the year ended Dec. 31, last, totaled $1,104,327 after all charges including provision for Federal income taxes, equal after preferred dividend requirements to $1.79 a share on the 576,160 shares of common stock outstanding, exclusive of Treasury shares. This compares with net profits of $1,535,110, or $2.55 a share on common stock in the preceding year.

Net sales last year totaled $3,603,239.93 compared with $12,245,068 in 1938. The company's profits last year were more than 30 per cent of net sales compared with 12.5 per cent in 1938 and 10.1 per cent for the entire period since 1924.

COSTS LOWER

Costs and expenses applicable to products sold totaled $2,239,126 compared with $10,422,747 in 1938, leaving profits from operations of $1,364,113 against $1,822,321. The company follows the policy of not taking profits on contracts unless substantially completed.

Commenting on the low level of deliveries last year R. H. Fleet, president of the company, said this was due to the large amount of new aircraft design and development work, together with production work in tooling and making detail parts and assemblies for airplanes for delivery during 1940 and 1941.

TAX AGREEMENT

Coincidentally with the execution of the contract with the United States Navy for $20,016,700 of flying boats, the company obtained a closing agreement with the government covering the method of amortizing the cost of added facilities, both for income-tax and profit-limitation purposes.

Because of the construction program, totaling approximately

Turn to page 26, Column 6

Aircraft Corp. Backlog Soars

Continued from 24th Page

$2,000,000, to handle the large backlog and desire of avoiding if possible the issuance of new stock, directors decided against declaring a dividend on common stock in order to retain the funds in the business.

The balance sheet as of Dec. 31, last, shows current assets of $7,607,619 including cash of $3,080,266 and inventories of $4,244,660 compared with current liabilities of $3,613,749. A year earlier current assets were $5,225,715, including cash of $3,586,478, and inventories of $1,134,964 compared with current liabilities of $1,554,491.

The company's employees now number approximately 4300, about 100 men a week are being added, and three shifts are being operated.

Since organization in 1924 the company has delivered a total of $55,030,960 of planes, including $32,684,268 for the Navy, $12,241,269 for the Army and $10,105,423 for all others.

VISITOR LADENED WITH LEIS

TRIB 3/19/40

When Mrs. C. A. Van Dusen, wife of the vice president of Consolidated Aircraft company, met her son in Honolulu, C. A. Van Dusen III, she was covered almost completely with beautiful flower leis. Ens. Van Dusen is flying planes for the navy in Honolulu. Mrs. Van Dusen will leave Honolulu Friday.

CONSAIR PLACES ORDER

AVIATION, *March, 1940*

High Wing Bomber

The Army's new Consolidated bombardment plane, XB-24, has just made its initial flight at Lindbergh Field, San Diego. It is powered with four Pratt & Whitney 18-cylinder twin-row radial engines rated at 1200 h.p. each. Propellers are Hamilton Standard three-blade hydromatic constant speed, 12 feet in diameter.

The XB-24 is a high-wing type, all metal construction, full cantilever high aspect ratio, with tractor nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard from the ailerons.

AVIATION 3/40

REPORT CARD

Of Air School

With thousands of new men needed for Southern California aircraft factories, the aviation schools of that section have been hard pressed to provide enough skilled men. Every school and factory has cooperated to make the expansion process as orderly as possible. At Lockheed an extensive employee training program is in full swing. In San Diego, where Consolidated Aircraft Corporation is currently doubling its factory facilities and both Solar and Ryan are hiring steadily, the vocational schools of the city have taken a hand in the training program, offering six-week courses designed to teach aircraft shop fundamentals to 2000 young men by July 1st. Ryan School of Aeronautics has expanded its course to include a six-week mechanic course, and has inaugurated a number of new training programs, including a course for parachute riggers.

Consolidated Expands

AV. 3/40

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

New Consolidated

AVIATION 3/40

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

New Big Order For Solar Aircraft

TRIB 3/20/40

Solar Aircraft Co.'s backlog of business has been upped substantially by a $150,000 order from the Glenn L. Martin Co., Baltimore, one of the world's largest airplane manufacturers. The order is for manifolds, tail pipes and preheaters of the latest type developed by Solar, and will be installed in military planes for the United States air corps.

Edmund T. Price, president, said the Martin order, and the $180,000 order recently placed by Consolidated Aircraft Corp., are the two largest in Solar's history. Both carry options for considerably increased quantities, which the company expects will be exercised during the year.

AIRCRAFT NEWS

Thursday, March 21, 1940

Navy Bombers Fly Over Equator

HONOLULU—Six Navy patrol-bombers landed safely at Canton Island, south of the Equator, after a mass flight of nearly 2000 miles from Honolulu, naval officers disclosed Friday.

The landing was the first arrival of American naval planes at the mid-Pacific aviation base jointly controlled by England and the United States. The trip also marked the first flight across the Equator in the Pacific by United States warplanes. The unpublicized journey was a forerunner of the flight of a full squadron of planes some time before June from the Pearl Harbor naval base here to Manila.

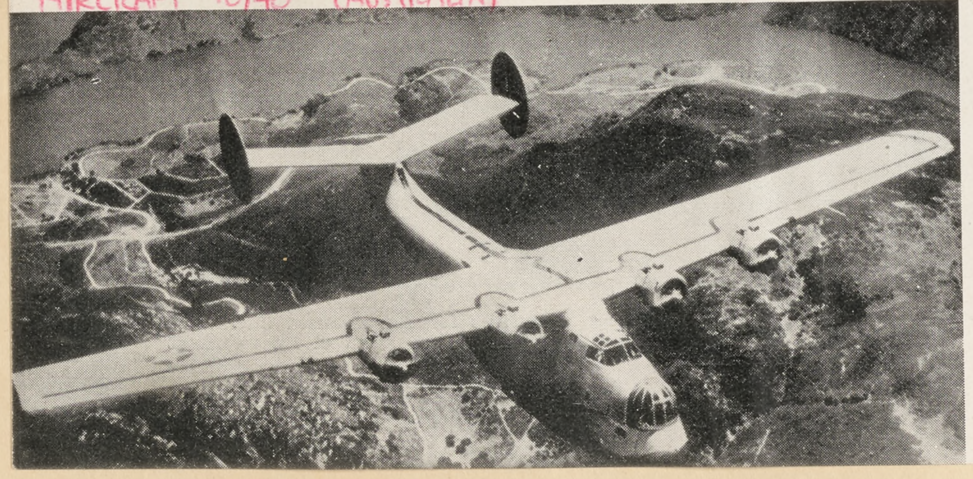
Consolidated Gets Plane Export Permit

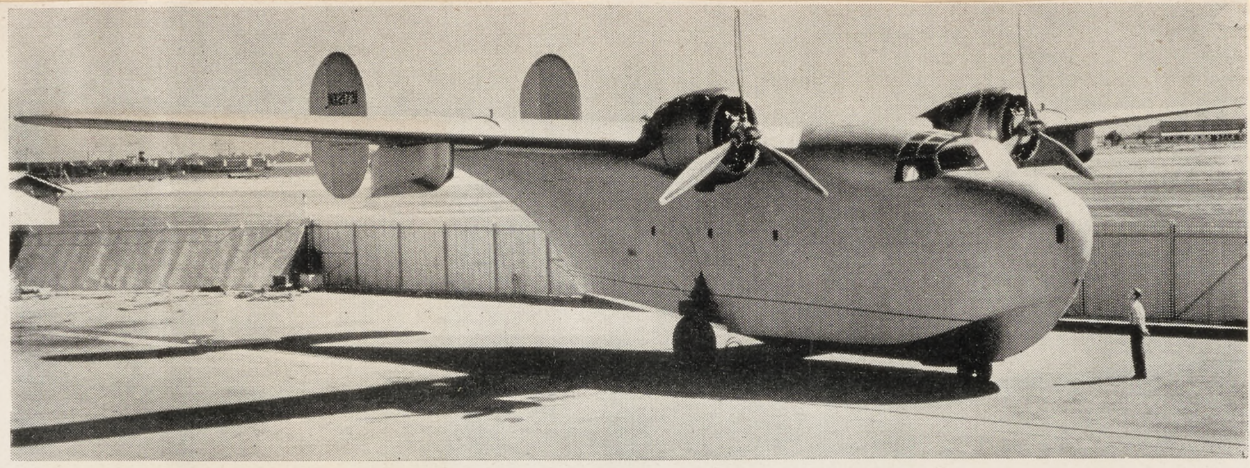
SAN DIEGO. — Consolidated Aircraft Corp. announced this week that a release had been received from the government for export sale of patrol bombing planes for Allied use.

The company declined to announce the number of planes being built, for what nation they were consigned or the price of the contract, but stated "we are well along in the early stages of construction."

NAVY BOMBER. — The latest Consolidated carried 49,000 pounds in bombs and torpedoes during recent tests. A range of 4000 miles is available.

AIRCRAFT 10/40 (AUSTRALIA)





Is this all true ?

THE CONSOLIDATED AIRCRAFT CO'S newest product is easily the most remarkable flying boat ever built. With an all-up weight of 50,000 lb., it is the biggest boat ever powered with two engines, but these are the new Duplex Cyclones, giving 2000 horsepower for take-off. It is reported that top speed is 275 miles an hour, and range 10,000 miles. Outstanding features are the great depth of hull, the sudden sweep-up from the deep section to the tail, and the small size of the wing. Wing loading must be very high, but Fowler flaps keep the landing speed within bounds. Accommodation is provided for 52 day passengers, 28 sleepers; for Atlantic services, 28. The new boat was built as a private venture without official support of any kind, and the company states that design and construction took only 10 months, an almost incredible figure. It seems certain that the U.S. Navy will seize the opportunity of ordering a few squadrons.

Consolidated Aircraft Allowed Charge-Offs

Consolidated Aircraft Corp. has negotiated a closing agreement with the Treasury Department under which the company will be allowed to charge off as an indirect factory expense the cost of tools used during the period of contract performance. The company, which recently was awarded a $20,016,699 contract for Navy patrol bombers, will also be permitted to charge off the depreciated cost, less salvage value, of buildings which must be demolished to carry out the contract, while costs involved in the razing also are deductible.

While the Treasury Department has stated that deductions under closing agreements with manufacturers do not represent a form of tax concession, Consolidated will have the advantage of knowing in advance what allowances will be permitted in the way of depreciation and obsolescence on plant and equipment for tax purposes and in calculating allowable profit under the Vinson-Trammel Act as amended during the last session of Congress by the National Defense Act. This closing agreement negotiated with Consolidated Aircraft is the second to be announced by the Treasury Department, and the first involving the aviation industry.

Aircraft Corp. Backlog Soars

Consolidated Orders at $49,000,000 Set All-Time High Mark

Consolidated Aircraft Corp. of San Diego, in releasing its annual report yesterday disclosed that the backlog of unfilled orders had reached an all-time peak of $49,000,000, a volume sufficient to keep the plant busy until midsummer of 1941.

This represents an increase in the backlog of nearly $8,000,000 since the first of this year, the unfilled orders at the close of 1939 having been $42,141,694. The company stated that during the past few months it had received contracts from foreign customers for a released version of the PBY ship, a two-engine long-range navy patrol bomber.

PROFITS SHOWN

Net profits for the year ended Dec. 31, last, totaled $1,104,327 after all charges including provision for Federal income taxes, equal after preferred dividend requirements to $1.79 a share on the 576,160 shares of common stock outstanding, exclusive of Treasury shares. This compares with net profits of $1,535,110, or $2.55 a share on common stock in the preceding year.

Net sales last year totaled $3,603,239.93 compared with $12,245,068 in 1938. The company's profits last year were more than 30 per cent of net sales compared with 12.5 per cent in 1938 and 10.1 per cent for the entire period since 1924.

COSTS LOWER

Costs and expenses applicable to products sold totaled $2,239,126 compared with $10,422,747 in 1938, leaving profits from operations of $1,364,113 against $1,822,321. The company follows the policy of not taking profits on contracts unless substantially completed.

Commenting on the low level of deliveries last year R. H. Fleet, president of the company, said this was due to the large amount of new aircraft design and development work, together with production work in tooling and making detail parts and assemblies for airplanes for delivery during 1940 and 1941.

TAX AGREEMENT

Coincidentally with the execution of the contract with the United States Navy for $20,016,700 of flying boats, the company obtained a closing agreement with the government covering the method of amortizing the cost of added facilities, both for income-tax and profit-limitation purposes.

Because of the construction program, totaling approximately

Turn to page 26, Column 6

Aircraft Corp. Backlog Soars

Continued from 24th Page

$2,000,000, to handle the large backlog and desire of avoiding if possible the issuance of new stock, directors decided against declaring a dividend on common stock in order to retain the funds in the business.

The balance sheet as of Dec. 31, last, shows current assets of $7,607,619 including cash of $3,080,266 and inventories of $4,244,660 compared with current liabilities of $3,613,749. A year earlier current assets were $5,225,715, including cash of $3,586,478, and inventories of $1,134,964 compared with current liabilities of $1,554,491.

The company's employees now number approximately 4300, about 100 men a week are being added, and three shifts are being operated.

Since organization in 1924 the company has delivered a total of $55,030,960 of planes, including $32,684,268 for the Navy, $12,241,269 for the Army and $10,105,423 for all others.

1,000 SEE MOVIE AT AIRPORT

Construction and Test Flight of Navy Plane Is Shown.

A crowd estimated at slightly more than 1,000 persons went to the plant of the Missouri Aviation Institute at the Municipal Air termina last night to see a sound motio picture depicting the constructio and test flight of a navy flying boat

The picture was supplied by th Consolidated Aircraft corporatio of San Diego, Calif. Students at th institute, representatives of the Civ Aeronautics authority and guest comprised the unexpectedly larg audience.

AVIATION, *March, 1940*

High Wing Bomber

The Army's new Consolidated bombardment plane, XB-24, has just made its initial flight at Lindbergh Field, San Diego. It is powered with four Pratt & Whitney 18-cylinder twin-row radial engines rated at 1200 h.p. each. Propellers are Hamilton Standard three-blade hydromatic constant speed, 12 feet in diameter.

The XB-24 is a high-wing type, all metal construction, full cantilever high aspect ratio, with tractor nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard from the ailerons.

AVIATION 3/40

REPORT CARD

Of Air School

With thousands of new men needed for Southern California aircraft factories, the aviation schools of that section have been hard pressed to provide enough skilled men. Every school and factory has cooperated to make the expansion process as orderly as possible. At Lockheed an extensive employee training program is in full swing. In San Diego, where Consolidated Aircraft Corporation is currently doubling its factory facilities and both Solar and Ryan are hiring steadily, the vocational schools of the city have taken a hand in the training program, offering six-week courses designed to teach aircraft shop fundamentals to 2000 young men by July 1st. Ryan School of Aeronautics has expanded its course to include a six-week mechanic course, and has inaugurated a number of new training programs, including a course for parachute riggers.

Consolidated Expands

Av. 3/40

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, and 400,000 sq. ft. will be roofed. New facilities will include final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

New Consolidated

AVIATION 3/40

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

TRIB 3/20/40

New Big Order For Solar Aircraft

Solar Aircraft Co.'s backlog of business has been upped substantially by a $150,000 order from the Glenn L. Martin Co., Baltimore, one of the world's largest airplane manufacturers. The order is for manifolds, tail pipes and preheaters of the latest type developed by Solar, and will be installed in military planes for the United States air corps.

Edmund T. Price, president, said the Martin order, and the $180,000 order recently placed by Consolidated Aircraft Corp., are the two largest in Solar's history. Both carry options for considerably increased quantities, which the company expects will be exercised during the year.

£8,000,000 AIR ORDER FOR U.S. COMPANY

Daily Express Air Reporter

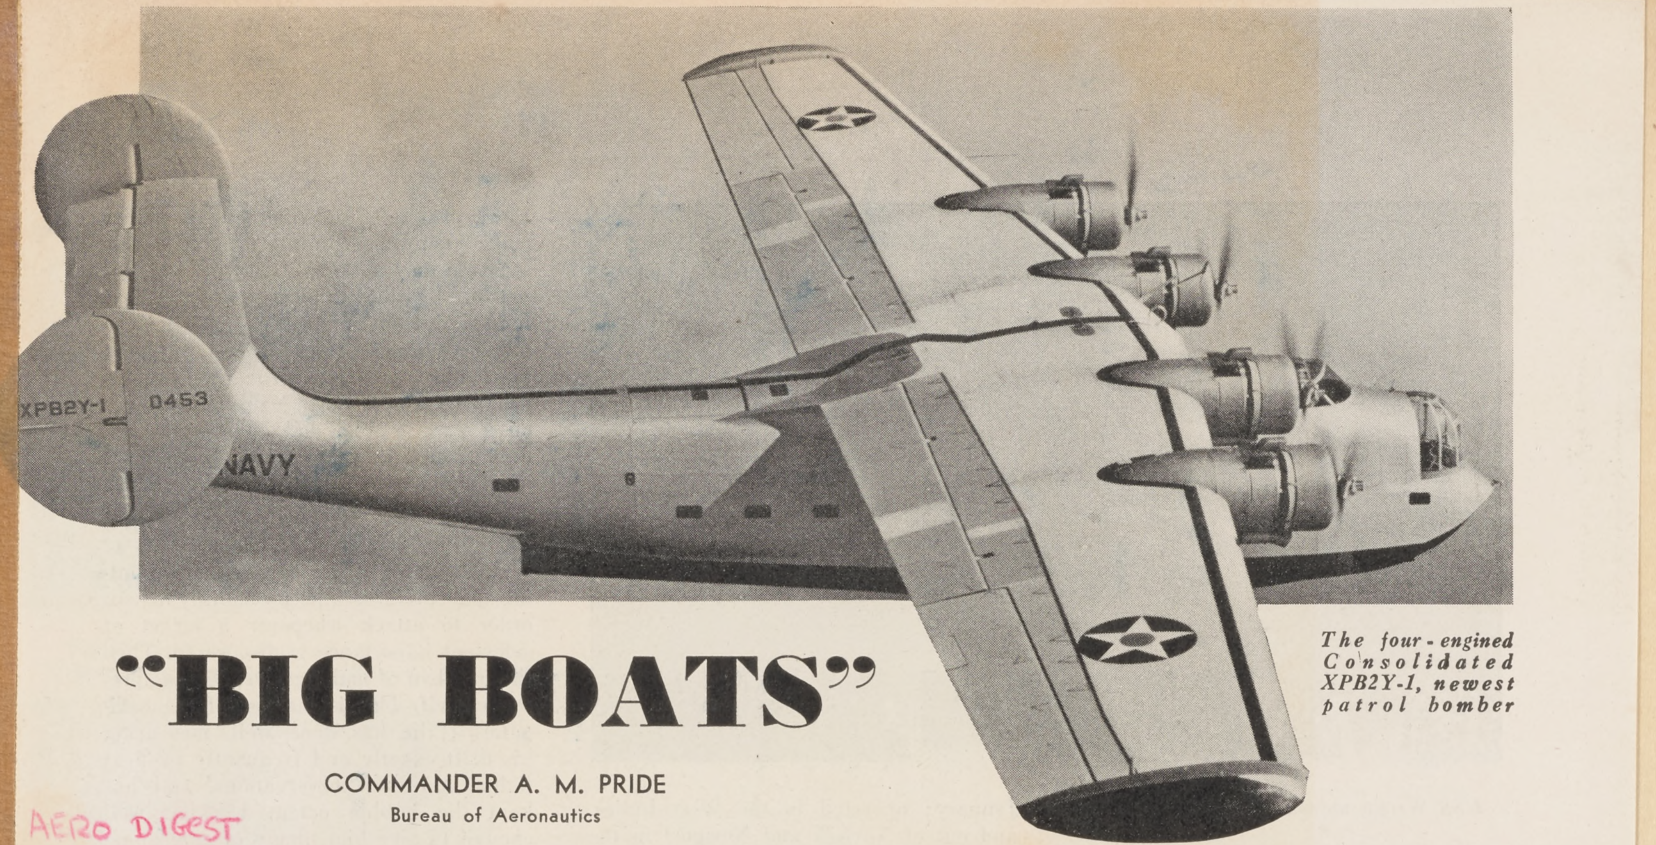
AN American aircraft company which has already supplied to the RAF one of its newest type of long - range reconnaissance flying boats has more than £8,000,000 worth of aircraft orders on hand.

How much of this enormous sum represents British repeat orders is a close secret, but I understand that £4,000,000 is constituted by the biggest single aircraft order ever placed by the U.S. government.

The aircraft company is the Consolidated Aircraft Corporation of California.

Just before war broke out a Consolidated PBY flying-boat flew the Atlantic to join the RAF on trial. The flying-boat covered the 2,500 miles from Newfoundland to Felixstowe in about 15 hours.

As a result of its £8,000,000 worth of orders, the Consolidated Corporation is doublin gthe area of its factory space from 32 to 64 acres.



The four-engined Consolidated XPB2Y-1, newest patrol bomber

"BIG BOATS"

COMMANDER A. M. PRIDE

Bureau of Aeronautics

AERO DIGEST
FEB. 1940

● In the early days of naval aviation there were F-boats, H-boats and "Big Boats." F-boats were little frail flying boats with Curtiss OX engines; H-boats were larger, had a Liberty engine and were the ultimate vehicles for most of our World War crop of Naval Aviators. But for the favored and the skillful, there were the two-engined "Big Boats"—H-12's with the long flat-bottomed tails; the handy H-16's with their multiplicity of cables and struts, and their counterparts, the F5L's. Only a few H-12's were built, but a great many H-16's and F5L's went into service both here and abroad and for several years after the War they comprised the principal equipment of the scouting air squadrons attached to the Fleet.

As today, the "Big Boats" went with the Fleet into its problem areas and back to the home ports between major problems. The 60-hour periods between overhauls of the Libertys were no help in keeping up with the battleships and many were the engines which had to be changed while planes were secured to the fan-tail of a mine-sweep or beached on a sheltered strand. Even so, the cruises went ahead, year after year, and by the time most of the Libertys had been used up and every hard landing was smashing in the bottom of a hull which had dried out in too-long storage, it was realized that something had to be done to carry on the work of the large seaplane after the last F5L had done its service.

COMDR. A. M. PRIDE: Enrolled in Naval Reserve from civilian life (1917). Aviation Assignments—England and France (1918); Chatham Air Station and Carlstrom Field, Arcadia (1919-'20); USS Arizona, Hampton Roads Air Station, Mitchell Field (1920-'21); USS Langley (1921-'24); postgraduate instruction in aeronautical engineering at Naval Academy and MIT (1924-'25); USS Saratoga and Lexington (1926-'29); Hampton Roads Naval Air Station (1929-'32); VF Squadron 3-B aboard USS Langley (1932-'34); In charge Flight Test Section, Anacostia Naval Air Station (1932-'36); Bureau of Aeronautics (1936-'37); Air Officer, USS Wright (1937-'38); Staff, Patrol Wing One (1938-'39); Aeronautical Board, Bureau of Aeronautics (June 1939 to date).

New construction involved features of metal structures and radial air-cooled engines, but the old angular hull lines and sponsons were retained. Wings of the new boats advanced from the multiple bay trusses, used thicker and more efficient sections and improved the cleanliness of the whole plane. The absence of the "Dutch landscape" effect provided on the top of the hulls by an assortment of windmills to drive various accessories was not regretted.

From the metal counterparts of H-16's and F5L's, the type passed through the biplane stages common to other types of the period, but with little improvement, except such as might be incident to improved power plants. Then came the Hall PH-1 with no gasoline in the hull, no sponsons and a pay-load to gross weight ratio which made its predecessors out-of-date. This product appeared at about the time Martin and Consolidated planes were making it look as though the biplane, as a patrol plane type, would soon be gone. It was not long before the Consolidated PY Series were edging into the picture to the exclusion of everything else. This family abandoned the lower wings, used cantilever wings and retracting wing-tip floats, and brought refinements exemplified by the various versions of the PBY.

The "B" (for "bomber") was included with the "P" and the "Y" while the first of the current models was undergoing trials and it became apparent that this craft could do some effective bombing if such were required. Successive production schedules have placed in service the PBY-1, -2, -3 and -4, and the XPBY-5

The Martin XPBM-1 patrol bomber, a twin-engined, gull wing monoplane

19 FEB 1940

U.S. flew "sample" to R.A.F.

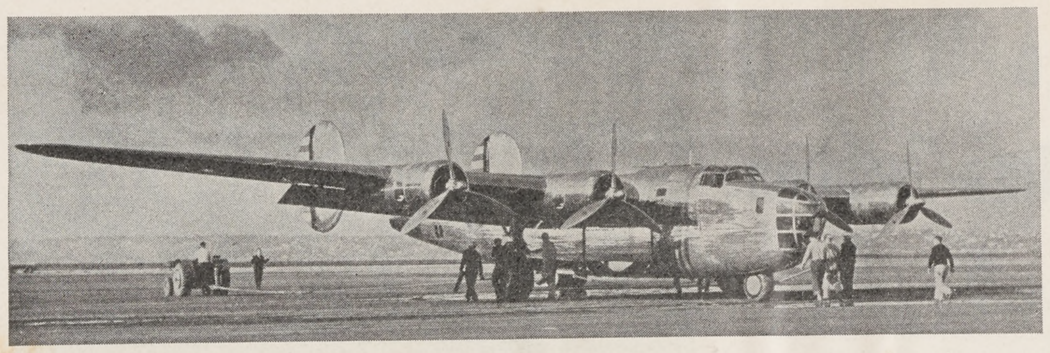
Daily Express Air Reporter

THE Consolidated Aircraft Corporation of California, which has already supplied to the R.A.F. one of its newest type of long-range reconnaissance flying-boats, has more than £8,000,000 worth of aircraft orders on hand.

How much of this represents British repeat orders is a secret. Just before war broke out a Consolidated P.B.Y. flying-boat flew the Atlantic to join the R.A.F. on trial.

The corporation is doubling the area of its factory space at San Diego from 32 to 64 acres.

WESTERN FLYING MARCH 1940



First officially released photograph of the Consolidated B-24 four-engined bomber built for the U. S. Army Air Corps. Note that the huge ship incorporates the new Davis "mystery" wing and tricycle landing gear.

DETAILS ON NEW CONSOLIDATED BOMBER RELEASED BY AIR CORPS

THE **U. S. Army Air Corps'** new bombardment airplane, technically known as the XB-24, recently made test flights at Lindbergh Field, San Diego, California.

Built by the **Consolidated Aircraft Corp.,** it is a four-motored bomber of high wing, all-metal construction. The wing is a full cantilever type of high aspect ratio with four tractor engine nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard of ailerons.

Power is furnished by four Pratt & Whitney 18-cylinder twin-row radial air-cooled engines rated at 1200 h.p. each. The propellers are Hamilton Standard three-bladed hydromatic constant speed types, 12 ft. in diameter.

The approximate gross weight of the airplane is 40,000 lb.; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric-covered and fully counter-weighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back, and bottom. The landing gear is of tricycle type with single wheel forward. This retracts into the fuselage. The rear or main landing wheels retract into wing wells.

This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately four tons.

MARCH 1940

Western Flying

CONSAIR STARTS EXPANSION WORK

CONSOLIDATED Aircraft Corp., San Diego, has embarked upon a factory expansion program which will increase the present area of the plant by 87 per cent at a cost of more than $2,000,000.

Seven new steel frame buildings will be erected at an expense of $1,200,000 and in excess of $800,000 will be expended for new production equipment. Bids have already been called for the construction work. By late 1940 Consolidated's factory will embrace 1,500,000 square feet and employ at least 7000 men on Army and Navy contracts which form the bulk of Consair's $43,000,000 backlog.

The original factory buildings are less than five years old. The large experimental building, the photo, physical and chemical laboratory, paint storage and tool buildings are just over three years old. Prior to the expansion program Consolidated had 24.7 acres of land on **Lindbergh Field** under lease and 7.6 acres under option. New leases and options now cover an area of 64 acres.

In addition to new buildings, all factory yard areas will be paved and used for outdoor assembly and maintenance areas.

Orders for which the plant is being enlarged are the Navy contract of $20,016,699 for long range patrol bombers and the Army Air Corps contract of $11,365,000 for a fleet of the new B-24 bombers.

NEWS REVIEW, *February* 1, 1940

CONSOLIDATED FLYING BOAT
Floats form its wingtips

at 300 m.p.h., it is a stubby low-winged monoplane armed with four machine-guns.

¶ Fitted with the same type of blunt radial engine, the Curtiss Hawk has an equivalent speed, a range of 1,210 miles and a ceiling of 31,800 ft. Latest models incorporate armour-plating behind and underneath the closed-in pilot's cabin.

¶ To swell the fleet of British flyingboats used by the Coastal Command for submarine spotting and convoy work, Britain has ordered substantial numbers of all-metal Consolidated machines. Two engines mounted on streamlined superstructures above the wing give the plane a top speed of over 200 m.p.h. and can lift it to 29,700 ft. Range is estimated at 4,000 miles. During flight the Consolidated's floats are retracted to form wing tips.

Strategical and Tactical Employment of Naval Aircraft

COMMANDER M. B. GARDNER
Office of the Chief of Naval Operations

COMDR. M. B. GARDNER: Graduate Naval Academy ('18). Before taking flight training served with Destroyer Force in France, and on USS Jarvis, Biddle and McFarland. Aviation assignments—Pensacola Naval Air Station for flight training (1922); Air, Bat. Force (1922-'24); Pensacola Naval Air Station (1924-'26); Air Corps Advanced Flying School (1926-'27); Fighting Squadron 5, USS Lexington (1927-'29); Anacostia Naval Air Station (1929-'31); Fighting Squadron 6, USS Saratoga (1931-'33); Staff, Aircraft Battle Force (1933-'34); Pensacola Naval Air Station (1934-'36); USS Saratoga (1936-'37); USS Ranger (1937-'38); Office Chief of Naval Operations (June 1938 to date).

● There is no need to touch here on the adequacy or inadequacy of the Naval air arm. Suffice it to say that it is reasonably well-balanced by types and, with the realization in the near future of present plans, will be satisfactorily located geographically. Our concern here is with the most profitable employment, both strategically and tactically, of these instruments of war.

Clausewitz says, "War is only a continuation of political intercourse in a new form." It follows that war, so begun, will continue so long as the civil will to fight or resist by arms continues on both sides—and only so long. It has been axiomatic that this civil will to resist may not be broken until vital parts of the enemy's armed forces have been destroyed or contained. In those nations within easy bomber range of each other, the development of the airplane may have modified this conception, in that by this instrument of war civil populations may be attacked directly. There has not yet, however, been conclusive evidence of the effectiveness of this procedure, particularly as regards first-rate powers with comparable air forces. Nor is it probable that, in our lifetime at any rate, this country would resort to that type of warfare. Yet the threat, at least, contains sufficient potency to warrant the maintenance by the major European powers of large air forces which are independent of their armies and navies and are in addition to the aircraft necessary to complement those arms.

This country is so fortunately located that, so far as can be foreseen, no such methods of warfare could be used against us successfully. Thus we are relieved of the necessity of maintaining a third arm and our Naval aviation has been developed as part and parcel of the Naval team. To this country, that conception of air effort in the early development of the airplane has been a tower of strength. It follows that when we speak of strategy in connection with Naval aircraft, is is indistinguishable from the Naval strategy of which it is a part.

The terms "strategy" and "tactics" are somewhat elastic. The latter often derives from the former insidiously, such that it is difficult sometimes to draw a definite line between the two. In order that we may be on common ground in this respect, some definitions are in order. Webster defines strategy as "The science or art of projecting and directing great military movements," and tactics as "The art of handling troops or ships in battle or in the immediate presence of the enemy."

In a military sense, strategy involves the broader plan of action and takes into consideration such factors as the geography of the theatre of operation, disposition of forces, relative points of strength and weakness, and the enemy's probable courses of action. There is grand strategy and minor strategy; the former applying to the concept of the war as a whole and the latter to that of its phases or component operations. We are interested particularly in grand strategy.

Strategically, the defensive value of aircraft increases directly as the distance between the hostile nations. Not only is this basic consideration particularly adapted to our military policy, but it conditions every aspect of our Naval aviation. The United States is fortunate in being flanked by two broad oceans. Yet, while these oceans form our greatest element of security, they are also the highways whence portends any

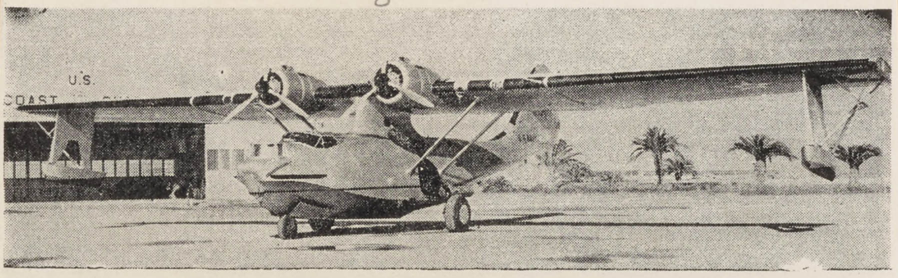
U.S. Coast Guard - Oct. 1940



LATEST IN AMPHIBIANS

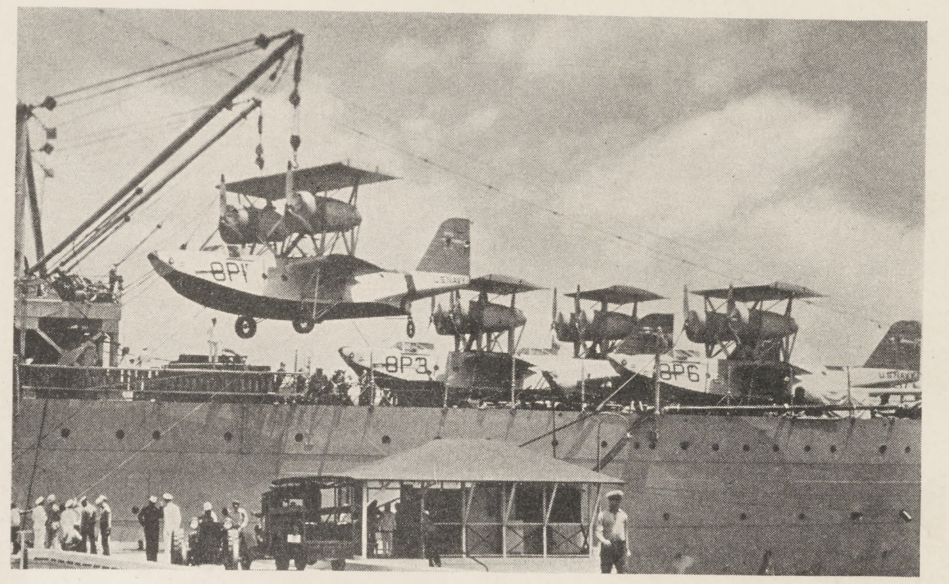
This is the spectacular new amphibian being currently produced by the Consolidated Aircraft Corporation, San Diego, Calif., and known as Model 28-5A (designated by the Navy as XPBY-5A). This amphibian offers many aeronautical features which are the subject of careful study by Coast Guard aviation experts. Note the tricycle landing gear and the wing-tip pontoons which become extended parts of the wing when in flight.

On Page 10 of our September issue appeared the above picture. The descriptive lines accompanying pictures of the Consolidated Model 28-5A Amphibian and the GUBA flying boat were run together in a manner that confused some of the basic qualities of these two planes.

Consolidated Model 28-5A, pictured above, is a military-naval true amphibian. This plane is a product of the Consolidated Aircraft Corporation, San Diego, Calif.

The GUBA, as every aircraftsman knows, is Richard Archbold's private flying boat, most certainly not an amphibian.

We regret the error.



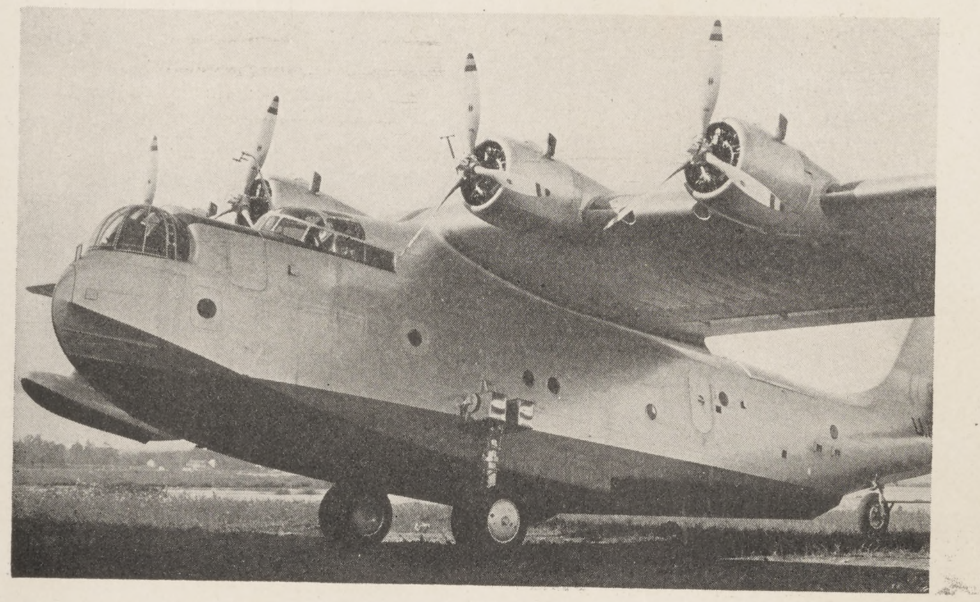
USS Wright *unloading patrol bombers*

amphibian is now undergoing flight tests.

Flying-boat squadrons are grouped in "wings" which are units of the Fleet. Each wing has a normal strength of four 12-plane squadrons and has a home port in the fashion of the ships of the Fleet. In order that it may work away from the home port, tenders are assigned to (and identified with) each wing and the combination of planes and tenders provides a mobile and complete organization.

In peace time, each wing must operate at a distance from its home port during fairly extended periods and the idea of mobility is emphasized. As an instance, last year, Patrol Wing One left its home port, San Diego, in June; spent the summer in the Puget Sound area and in Alaska; returned to San Diego for gunnery exercises and servicing in the autumn; departed for Panama early in January; operated in the West Indies, and out of Norfolk and Newport in the spring and returned to San Diego *via* Guantanamo, Panama and the Gulf of Fonseca in the latter part of May. There was no doubt about the mobility of that outfit, and the others, having home ports in Seattle, Norfolk, Coco Solo and Pearl Harbor, are maintained on the same basis. At present, Patrol Wing Five (home port Norfolk), has its squadrons working out of various ports from San Juan to Newport on Neutrality Patrol, and another wing has one of its squadrons and a tender operating out of Manila. This dispersion of squadrons and tenders to form self-sustaining units in far-flung areas was accomplished without delay. It was simply another move such as occurs to the "big boat" personnel and equipment during every Fleet problem.

Vought-Sikorsky four-engined patrol bomber



A Real Job in Navigation

Insofar as possible, squadrons are operated as tactical units. Scouting flights consume most of the flying time during Fleet exercises and the twelve planes make a convenient unit to which a sizable sea area may be assigned for search and patrol. By the time a squadron has fanned out on a scouting line several hundreds miles at sea, it may not look much like a squadron formation, but the squadron commander keeps his planes on a precise line, and exactly abreast, even though they are miles out of sight of each other. At such times, radio silence is maintained, so exact navigation is required.

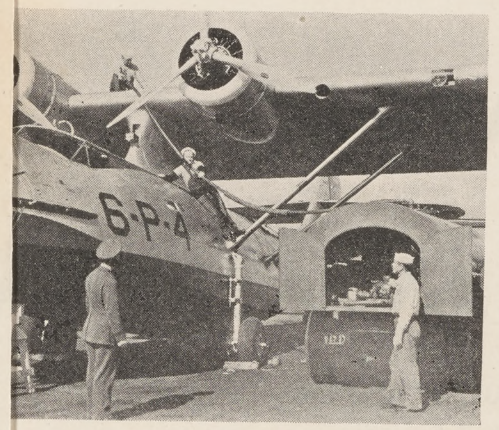
In the later stages of any such scouting job there is the probability of an order to attack whenever a target of sufficient importance is discovered. Then the problem of making a rendezvous presents itself. This is the test of the navigator. If he has done well, measuring his drift exactly and frequently by float lights and drift observations, and has kept the bubble octant working well enough to give him plenty of confirming lines of position, perhaps crossed by radio bearings on any shore stations within range, he is fortunate. But, overcast may have prevented celestial observations, extended fog areas may have prevented drift observations, unusual atmospheric conditions may have obstructed radio bearings, and it is rare, indeed, that the navigator of a "big boat" can be dead sure of exactly where he is. Fortunately, it is almost as rare for a plane to miss its rendezvous, and this is certainly due to the elaborate precautions which are taken to avoid missing any opportunity to check the dead-reckoning. Failure to make a rendezvous is one error which man can make that can never be covered up.

When the rendezvous is made, the squadron commander deploys his planes for the attack. If there has been opportunity for the wing to concentrate, he falls into his assigned position, according to his wing commander's doctrine, and it is simple for the navigators from that point on. They continue to check their positions and courses and keep an eye out for the shortest route to a harbor if trouble should develop.

In other than the skipper's plane, the pilot who is off-duty usually navigates while the "duty" pilot watches the instruments and sees that the automatic pilot stays on the job. The plane captain, or "off-duty" radio operator, or mechanic usually slips into the other pilot-seat just to keep the duty pilot company.

At all times, one radioman must be at the equipment, and a mechanic must be in the "saddle" watching the power plant indicators.

As with all bluejackets, their thoughts run largely to food when they are not engrossed in their duties and the furnishing of "big boats" with cooking equipment has uncovered some surprisingly



Fueling the flying boats from a fuel truck, and from a tender (below)

proficient culinary experts. Each plane has a two-burner electric stove and each plane crew seems to include at least one enthusiast who delights in operating it.

When landings have to be made, the difficulties are of seamanship rather than airmanship. Taxying into the wind is easy if the chop does not drench the windshield, obscure vision and give the pilots a shower. Taxying across the wind is something else again, and if the cross-wind is strong it frequently requires fully throttling one motor, while the other is wide open.

If a buoy is to be made, one of the crew has to "take it" from the nose of the boat with a boat hook. He takes a turn with a light line as soon as he can, snubbing the buoy up close to the plane and then secures the riding pendant and "preventer." Despite much ingenuity, the perfect mooring arrangement for flying boats has not yet been devised and the wire cable and fittings with which the planes are equipped are paralleled with slack lines to prevent the plane from drifting down on its leeward neighbor if the riding pendant fails.

When the planes have been secured at their buoys, with covers on the cockpit enclosures and engines, and the watch stationed on board, the boat from the tender takes the crew to the ship.

Take-off Technique

Take-off technique in "big-boats" has changed with the years and with increased horsepower and improved hull lines. Thanks to extensive model basin experiments, and take-off trim investigations by the NACA, as well as plenty of experimenting by the service test and squadron pilots, it has been well established that the modern "big boats" do best when they have their control adjustments set at a predetermined point according to the position of the center of gravity and are then "flown" out of the water, with no violent "rocking." It used to be that a sharp "pull-back" was the customary maneuver to "unstick," but this seems to defeat its purpose as often as it helps. While judicious "pull-back" can still make a doubtful take-off certain, a similar movement at the wrong moment can ruin the chances of getting off.

Landing technique hasn't changed much except for a greater emphasis on "power-on" landings. The idea is to get down to the low speed while maintaining the plane in its best attitude for striking the water. "Power-on" is the safest way to land on a glassy surface, through a fog, or at night and much practice to perfect the technique is required of each pilot ordered to flying boats.

Handling flying boats in the air presents nothing peculiar which is not experienced in other types of similar size.

Communications, internal and external, are necessarily elaborate due to separation of stations through the plane and because of development of the flying-boat's potentialities as a source of information to other fleet units. Interphones serve for internal communications and headphones are worn habitually by all hands on watch.

As the plane is seldom operating independently, at least two, and sometimes more, external communications channels must be maintained. This calls for an elaboration of radio equipment found in no other service type. In common with surface vessel practice, distress frequencies are guarded, as are weather and military frequencies. In addition, radio-bearings must be obtained whenever available or required by the pilot or navigator.

As suggested previously, it is customary to turn over straight-away piloting to the automatic pilot and relieve the human pilots of as much of that work as possible. This plan has a real military value in that it enables the pilots to observe more of the ocean and air above it than if they had to give almost exclusive attention to steering the course, and flying the plane. And when it is considered that the most important reason for having "big-boats" is to have something to take pairs of eyes to where they can scan vast areas of the sea and the spaces above the sea, it is realized that these eyes must have little else to do.

It is difficult to predict where the increasing demands on the "big boat" will lead design. The tendency in "big boat" characteristics is toward 4-engined planes or toward increased performance in twin-engined types using the higher powered engines now coming into the picture. Consolidated has received a Navy contract for some of the 4-engined type. More endurance, and better living accommodations, with increased military loads, point to increasing sizes, but operational difficulties react against increasing size and weight. A large plane over a given area of the sea is not, necessarily, any more effective as an observation post than is a smaller plane. Furthermore, if the small plane

U.S. flew "sample" to R.A.F.

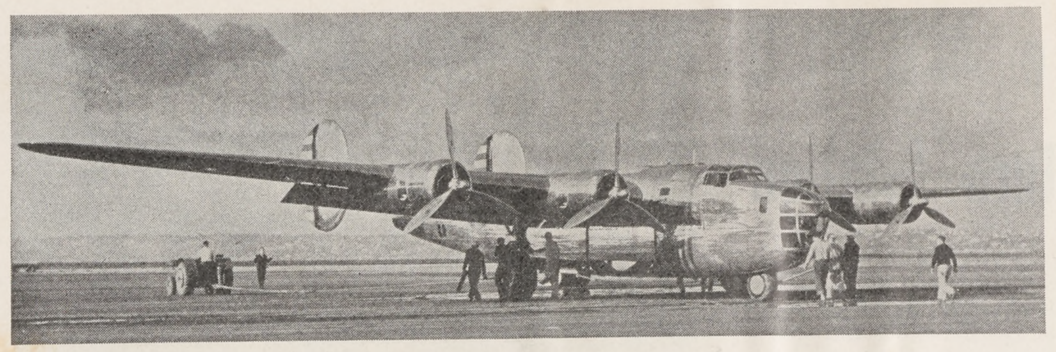
Daily Express Air Reporter

THE Consolidated Aircraft Corporation of California, which has already supplied to the R.A.F. one of its newest type of long-range reconnaissance flying-boats, has more than £8,000,000 worth of aircraft orders on hand.

How much of this represents British repeat orders is a secret. Just before war broke out a Consolidated P.B.Y. flying-boat flew the Atlantic to join the R.A.F. on trial.

The corporation is doubling the area of its factory space at San Diego from 32 to 64 acres.

WESTERN FLYING MARCH 1940



First officially released photograph of the Consolidated B-24 four-engined bomber built for the U. S. Army Air Corps. Note that the huge ship incorporates the new Davis "mystery" wing and tricycle landing gear.

DETAILS ON NEW CONSOLIDATED BOMBER RELEASED BY AIR CORPS

THE **U. S. Army Air Corps'** new bombardment airplane, technically known as the XB-24, recently made test flights at Lindbergh Field, San Diego, California.

Built by the **Consolidated Aircraft Corp.,** it is a four-motored bomber of high wing, all-metal construction. The wing is a full cantilever type of high aspect ratio with four tractor engine nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard of ailerons.

Power is furnished by four Pratt & Whitney 18-cylinder twin-row radial air-cooled engines rated at 1200 h.p. each. The propellers are Hamilton Standard three-bladed hydromatic constant speed types, 12 ft. in diameter.

The approximate gross weight of the airplane is 40,000 lb.; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric-covered and fully counter-weighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back, and bottom. The landing gear is of tricycle type with single wheel forward. This retracts into the fuselage. The rear or main landing wheels retract into wing wells.

This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately four tons.

MARCH 1940

CONSAIR STARTS EXPANSION WORK

CONSOLIDATED Aircraft Corp., San Diego, has embarked upon a factory expansion program which will increase the present area of the plant by 87 per cent at a cost of more than $2,000,000.

Seven new steel frame buildings will be erected at an expense of $1,200,000 and in excess of $800,000 will be expended for new production equipment. Bids have already been called for the construction work. By late 1940 Consolidated's factory will embrace 1,500,000 square feet and employ at least 7000 men on Army and Navy contracts which form the bulk of Consair's $43,000,000 backlog.

The original factory buildings are less than five years old. The large experimental building, the photo, physical and chemical laboratory, paint storage and tool buildings are just over three years old. Prior to the expansion program Consolidated had 24.7 acres of land on **Lindbergh Field** under lease and 7.6 acres under option. New leases and options now cover an area of 64 acres.

In addition to new buildings, all factory yard areas will be paved and used for outdoor assembly and maintenance areas.

Orders for which the plant is being enlarged are the Navy contract of $20,016,699 for long range patrol bombers and the Army Air Corps contract of $11,365,000 for a fleet of the new B-24 bombers.

NEWS REVIEW, *February* 1, 1940

CONSOLIDATED FLYING BOAT
Floats form its wingtips

at 300 m.p.h., it is a stubby low-winged monoplane armed with four machine-guns.

¶ Fitted with the same type of blunt radial engine, the Curtiss Hawk has an equivalent speed, a range of 1,210 miles and a ceiling of 31,800 ft. Latest models incorporate armour-plating behind and underneath the closed-in pilot's cabin.

¶ To swell the fleet of British flyingboats used by the Coastal Command for submarine spotting and convoy work, Britain has ordered substantial numbers of all-metal Consolidated machines. Two engines mounted on streamlined superstructures above the wing give the plane a top speed of over 200 m.p.h. and can lift it to 29,700 ft. Range is estimated at 4,000 miles. During flight the Consolidated's floats are retracted to form wing tips.

threat to that security from without. Security thus depends on control of vital and critical sea areas and that control, in turn, depends on full information of enemy activity in those areas and the power to counteract it. These two requirements form the basis for the strategical employment of naval aircraft—the ability to obtain information quickly and with comparative security, and the power to strike with the utmost flexibility.

This phase of naval strategy may be called the defensive. It is important while no war was ever won by the sumption of the defensive as the total of military effort, many have b lost through relative neglect of this v factor. The basis of all military or na strategy is geography. Let us exam our geographic situation and how it conditioned the strategical disposition aircraft.

NAVAL AVIATORS FOR NAVAL AVIATION

CAPTAIN GEORGE D. MURRAY, U. S. Navy
Head, Personnel Div., Bureau of Aeronautics

CAPT. GEORGE D. MURRAY: Graduate Naval Academy ('11). Naval assignments—USS Virginia and USS Ammen (1911-'15). Aviation assignments—Naval Air Station, Pensacola, for flight instruction (1915); Aeronautical Inspector, Naval Material Boston (1916-'17); Executive Officer, Naval Air Station, Norfolk (1918); Commanding Officer, Naval Air Station, Anacostia, (1918-'19); Executive Officer, Naval Air Station, San Diego, (1919-'21); Aircraft Battle Fleet, aboard USS Aroostook as Squadron Commander, VO-3, (1921-'22); Naval Aircraft Factory, (1922-'23); Squadron Commander, Torpedo Squadron 20, Asiatic Fleet (1923-'25); Naval Academy, flying duty, (1925); Bureau of Aeronautics (1925-'27); Aide to Commander-in-Chief, Battle Fleet (1927-'28); Executive Officer, USS Wright (1929); Naval Attache, London (1930-'33); Air Officer, USS Saratoga (1933-'35); Naval Air Station, Pensacola, (1935-'37); Executive Officer, USS Saratoga, (1937-'38); Commanding Officer, USS Langley (1938-'39); Bureau of Aeronautics (June 1939 to date).

● There is no longer any reason why a college man in good physical condition and interested in aviation should hesitate in reaching his decision to learn to fly the *Navy Way*.

Several avenues into Naval Aviation are now open to young men. There are three groups of aviators—Naval Aviators of the line of the Navy, Naval Aviators of the Reserve Force, and Naval Aviation Pilots from the enlisted ranks of the Navy. All take the same flight training at Pensacola, and, upon completion of training, are graduated into one of the groups mentioned above, depending on the source from which they entered.

This article will discuss first, the process by which a college man between the ages of 20 and 27 can, in a comparatively short time, get into the cockpit of a Navy plane and participate in the U. S. Navy's far-flung aircraft operations. This is a process in which outside influence and connections are not required and are not considered. Each applicant for training in the naval aviation reserve is his own sponsor, and the only qualifications he needs are citizenship, a good physique, good character, and at least two years of college training.

How can this training be obtained? A letter to the Commanding Officer of the nearest Naval Reserve Aviation Base will promptly bring an application blank and detailed information about the requirements. These bases are located at Squantum (Boston), Mass.; Glenview (Chicago), Ill.; Grosse Ile (Detroit), Mich.; Long Beach, Calif.; Opa Locka (Miami), Fla.; Minneapolis, Minn.; Floyd Bennett Field, Brooklyn, N. Y.; Oakland, Calif.; Kansas City, Kans.; Philadelphia, Pa.; Seattle, Wash.; Robertson (St. Louis), Mo.; and Anacostia, D. C. A letter may also be addressed to the Commandant, Naval Air Station, Pensacola, Fla.

After submitting an application, the applicant is requested to appear for his physical examination. This examination may be conducted at the nearest Naval Reserve Aviation Base, or in case sufficient applicants live in a section remote from any base, their locality will be visited by the examining board, to make it convenient for all. The physical examination is conducted by Naval flight surgeons and the candidate incurs no expenses except those of travelling to the point at which the examination is held.

Many inquiries have been received concerning the relation of the Civil Aeronautics Authority flight training program to Navy flight training. The Navy Department has a real interest in this CAA program because it will develop a potential supply of trained pilots which will be a genuine asset in the event of a national emergency. For this reason the Navy Department is following the progress of the CAA flight training of young college men and anticipates that many of them will apply for entry in the Naval Reserve and upon completion of naval flight training will qualify as Naval

"BIG BOATS"

(Continued from page 43)

can get there as quickly, and remain as long, it may be at an advantage in that the facilities which made it and maintain it and can make and maintain more units. However, the 250 or more PBY's now in service will be used for some time, and "big boat" operation will be the same, fundamentally, as it was with the H-16's—primarily scouting, and when opportunity dictates, bombing.

The large plane is more effective than its smaller counterpart if it carries more bombs to the same point, but, again, it is a more prominent and, frequently, less maneuverable target, and more small units might furnish a better set-up. New designs seem to indicate larger units, though, and the only safe prediction seems to be that, at least, "big boats" will remain "big" in the eyes of the pilots of other naval types, and that they are here to stay.

Stirring The News Hopper

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

Speaking of rivets, there are from a quarter to a half million rivets in every machine, and they make them themselves with intricate machines that shoot them out by the thousands, all lengths, sizes and dimensions. Some planes now under construction have a wing spread of 115 feet and weigh 55,000 pounds.

The metal used is mostly aluminum, mixed with a little copper and other metals for strength and plated and "electrocuted" to prevent rust and erosion.

One of the recent additions to their equipment is a 4500-ton hydraulic press, built especially for the company at a cost of $100,000 and which can

STIRRING THE NEWS HOPPER

(Continued From Page One)

apply pressure equal to the weight of a warship. These huge presses are mounted on strong springs to prevent knocking the building down when they are in operation.

In the painting department the rooms are air conditioned, with suction fans pulling the fumes outdoors while others keep the air fresh and moving.

The automatic machines making each separate piece of the 50,000 units, aside from screws, bolts, nuts and rivets, which go into the construction of a plane, keep grinding away throughout the day and night, and more than $2,000,000 worth of parts are now in the store rooms, ready to be delivered on requisition to the assembling sections.

The company carries health, accident and death insurance on all employees desiring it, at a cost far below similar insurance available elsewhere. The sick benefits amount to $15 a week for thirteen weeks to employees earning $1,000 a year, and more for those earning up to $3,000. There are $4,000,000 in risks now being carried.

In the annual report of President Fleet to the shareholders, just issued today, the net earnings of the company for 1939 were placed at $1,104,327. New production facilities to cost $2,000,000 are to be provided immediately, $1,150,000 for new buildings, $530,000 for new machinery and equipment, $100,000 for yard paving and drainage, $35,000 for moving and $185,000 for cranes for handling equipment. The main new building facing Pacific boulevard will be 360x720 feet, giving the company about a half mile frontage of buildings on Pacific.

The company publishes its own house organ called "The Consolidator," and sponsors and encourages athletic events among its employees, and maintains a relations officer on full time keeping in friendly contact with the employees' advising, assisting and working with them in solving their problems, and maintaining sympathetic relations between all branches of the institution.

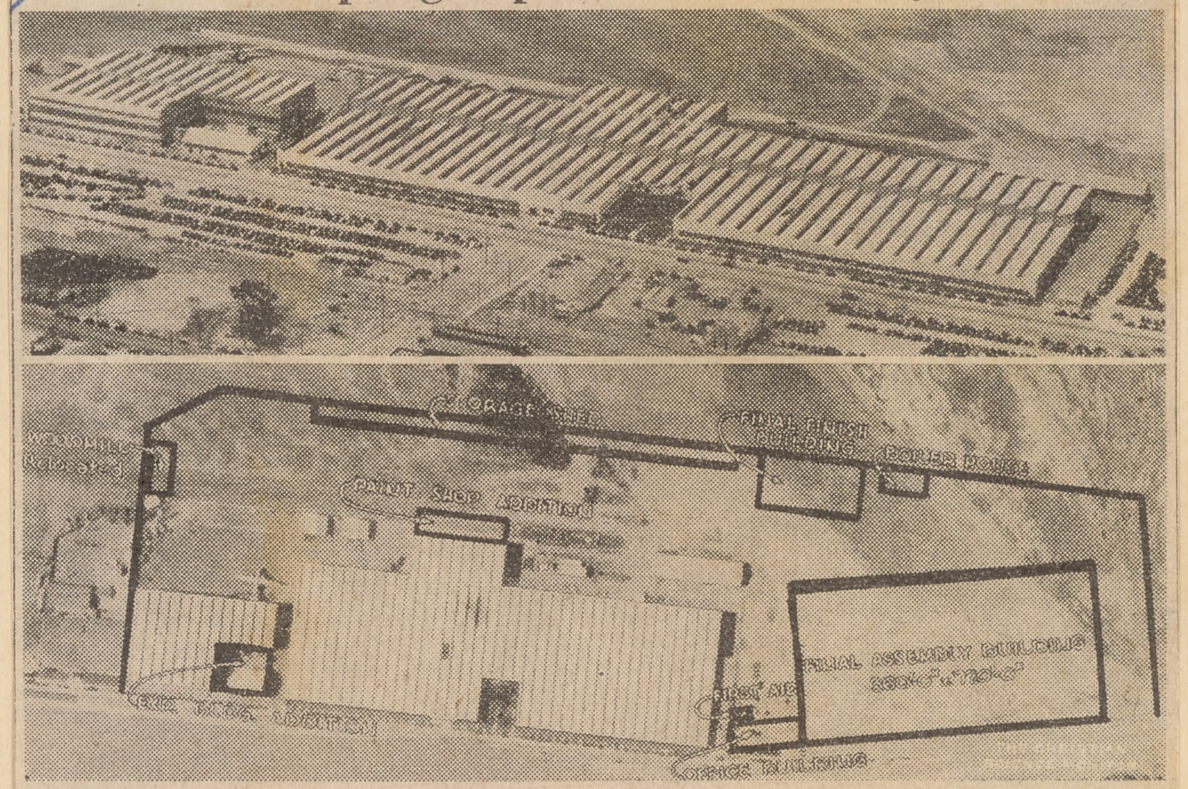
Keeping Up With the Navy



Consolidated

Airplane Shop and Expansion

Upper: View of present plant of Consolidated Aircraft Corporation at San Diego, Calif. Lower: Scheme (drawn on smaller scale than upper picture) for expanded plant, showing, at right, where steel canopy for Naval assembly will be erected; and at back, where final finish building and long storage shed will stand.

Factory Growth Demands 64 Airfield Acres

By the Aviation Editor of The Christian Science Monitor

An airplane factory outgrown by inability to handle orders rather than by obsolesence, accounts for outlay which Consolidated Aircraft of San Diego, Calif., has undertaken. A Consolidated factory less than five years' old, which is located on 24.7 acres of Lindbergh Field, the City's municipal airport, will be expanded with buildings, laboratories, and yard areas to occupy a space of 64 acres.

Consolidated's growth is typical of aircraft manufacturing in southern California, due to the demand for armament both at home and abroad. Received from the Navy Department on Dec. 20, 1939, was a contract for $20,016,699, which increased the backlog of the firm's unfilled orders to $40,000,000.

News in Aviation

Inasmuch as present orders utilize plant capacity, Consolidated makes the expansion to meet the terms of the Naval contract. Included in the project is an assembly building which will cover an indoors area 360 feet by 720 feet, with a clear span of 120 feet and a clearance from floor to the bottom of the roof trusses of 36 feet. In addition, much of the yard will be asphalted, for use in final assembly operations outdoors.

FARM BUREAU HEARS COUNTY OFFICIALS

Lakeside Farm Bureau dinner meeting was held last night as the Farmer went to press. Principal speakers programmed by Chairman Clarence Foster were Supervisor W. T. Hart, Assessor Crowell Eddy, Tax Collector Sam Claggett and County Auditor Robert W. Getty.. A sound movie was also to be shown by Field Sec. Frank Weaver of Consolidated Aircraft Company, San Diego.

By Rear Adm. John H. Towers, USN

THE mission of Naval Aviation in our national defense is, primarily, to increase the efficiency of the naval service.

The basic principle of the national policy of the United States is that our armed forces are maintained for defense purposes, and the basic principle of the Navy policy is to maintain our Navy at sufficient strength to support the national policies and commerce, and to guard the continental and overseas possessions of the United States. To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

Stirring The News Hopper

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

LE MATÉRIEL DES AVIATIONS NATIONALES

États-Unis

LES HYDRAVIONS CONSOLIDATED.

Les premiers modèles.

Les premiers hydravions construits par la *Consolidated Aircraft Corporation* datent de 1928. C'est à cette époque que furent construits pour l'*U. S. Navy* des bimoteurs *PY-1* « *Admiral* », équipés de moteurs *Pratt and Whitney;* ils comportaient deux postes de mitrailleur, pesaient 7270^{kg} en vol et mesuraient $30^{m},50$ d'envergure. Puis vint, en 1929, le bimoteur commercial « *Commodore* » pour 20 à 32 passagers qui fut utilisé entre New-York et Buenos-Ayres; son poids en vol était de 7990^{kg}, son envergure de $30^{m},50$. Sur les quatorze exemplaires construits, douze sont encore en service.

En 1932, *Consolidated* commença la sortie de ses sesquiplans bimoteurs de patrouille et de bombardement *P 2 Y*. Le prototype, le *X. P 2 Y-1* avait trois moteurs, deux entre les plans, un au-dessus qui fut supprimé ; le poids en vol était de 10880^{kg}, l'envergure de $30^{m},50$. Puis apparurent les types *P 2 Y-2* et *P 2 Y-3*, bimoteurs avec les fuseaux-moteurs installés dans l'aile, dont furent construits 23 exemplaires pour l'*U. S. Navy* et 10 pour des Marines étrangères.

Les 7 et 8 septembre 1933, six *P 2 Y-2* se rendirent en vol de groupe de Norfolk à Coco-Solo (zone de Panama), parcourant 3341^{km} en $25^{h}29^{min}$. Les 7 et 8 octobre 1933, les mêmes appareils joignaient Coco-Solo à San Diego, parcourant 4967^{km} en 30^{h}.

Le 22 janvier 1934, le *Patrol Squadron V.P.* 10 de six *P 2 Y-2*, sous les ordres du *lieutenant commander* Knefler Mc Ginnis, s'envolait de San Francisco et amerrissait à Pearl Harbour (hydrobase d'Honolulu, îles Hawaï) après $24^{h}45^{min}$ de vol, réalisant avec 3860^{km} le plus long vol en formation dans l'histoire de l'Aviation.

C'est au printemps 1935 que naquit le *PBY*. Cinq ans plus tard, cet appareil demeure incontestablement l'un des plus remarquables hydravions long-courriers construits en série.

Pour ses débuts dans le monde aérien, le *PBY* réalisa un coup de maître : son prototype, le *X. P 3 Y*-1 à moteurs *Pratt and Whitney* de 825$^{\mathrm{ch}}$, avec un équipage composé de Mc Ginnis, Averill, Sizer, Bolka et Wilkinson, élevait, les 14 et 15 octobre 1935, le record de distance en ligne droite à 5280$^{\mathrm{km}}$,015, battant de 940$^{\mathrm{km}}$ un record qui ne devait être battu qu'en octobre 1937 par le *Latécoère « Lieutenant-de-Vaisseau-Paris »*.

Les essais du prototype dépassèrent tellement les spécifications de l'*U. S. Navy* et les performances des concurrents qu'un premier marché, pour 60 bombardiers de patrouille *PBY*, fut aussitôt conclu. A l'heure actuelle, le nombre des *PBY* commandés par l'*U. S. Navy* dépasse 250. Notons qu'après livraison à la base aéronavale de North Island, chaque unité subit un vol sans escale d'une durée de 24$^{\mathrm{h}}$.

Ces appareils sont destinés aux bases du Pacifique et leur transfert se fait en vol, sous forme de « *routine flights* », avec les équipages militaires qui doivent les utiliser. Les moteurs sont des *Pratt and Whitney « Twin Wasp »* de 1000$^{\mathrm{ch}}$, à 14 cylindres en étoile double. C'est ainsi qu'ont été effectués les vols en formation dont la liste suit :

— 28-29 janvier 1937, 12 hydravions avec 80 hommes, de San Diego à Pearl Harbour (4108$^{\mathrm{km}}$ en 21$^{\mathrm{h}}$43$^{\mathrm{min}}$);

— 12-13 avril 1937, 12 hydravions avec 80 hommes, de San Diego à Pearl Harbour (4108$^{\mathrm{km}}$ en 21$^{\mathrm{h}}$21$^{\mathrm{min}}$);

— 21-22 juin 1937, 12 hydravions avec 84 hommes, de San Diego à Coco-Solo (4967$^{\mathrm{km}}$ en 27$^{\mathrm{h}}$58$^{\mathrm{min}}$);

— 8-9 décembre 1937, 14 hydravions avec 98 hommes, de San Diego à Coco-Solo (4967$^{\mathrm{km}}$ en 22$^{\mathrm{h}}$20$^{\mathrm{min}}$);

— 18-19 janvier 1938, 18 hydravions avec 127 hommes, de San Diego à Pearl Harbour (4108$^{\mathrm{km}}$ en 20$^{\mathrm{h}}$30$^{\mathrm{min}}$);

— 30-31 août 1938, 14 hydravions avec 98 hommes, de San Diego à Coco-Solo (4967$^{\mathrm{km}}$ en 26$^{\mathrm{h}}$40$^{\mathrm{min}}$);

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

Speaking of rivets, there are from a quarter to a half million rivets in every machine, and they make them themselves with intricate machines that shoot them out by the thousands, all lengths, sizes and dimensions. Some planes now under construction have a wing spread of 115 feet and weigh 55,000 pounds.

The metal used is mostly aluminum, mixed with a little copper and other metals for strength and plated and "electrocuted" to prevent rust and erosion.

One of the recent additions to their equipment is a 4500-ton hydraulic press, built especially for the company at a cost of $100,000 and which can

STIRRING THE NEWS HOPPER

(Continued From Page One)

apply pressure equal to the weight of a warship. These huge presses are mounted on strong springs to prevent knocking the building down when they are in operation.

In the painting department the rooms are air conditioned, with suction fans pulling the fumes outdoors while others keep the air fresh and moving.

The automatic machines making each separate piece of the 50,000 units, aside from screws, bolts, nuts and rivets, which go into the construction of a plane, keep grinding away throughout the day and night, and more than $2,000,000 worth of parts are now in the store rooms, ready to be delivered on requisition to the assembling sections.

The company carries health, accident and death insurance on all employees desiring it, at a cost far below similar insurance available elsewhere. The sick benefits amount to $15 a week for thirteen weeks to employees earning $1,000 a year, and more for those earning up to $3,000. There are $4,000,000 in risks now being carried.

In the annual report of President Fleet to the shareholders, just issued today, the net earnings of the company for 1939 were placed at $1,104,327. New production facilities to cost $2,000,000 are to be provided immediately, $1,150,000 for new buildings, $530,000 for new machinery and equipment, $100,000 for yard paving and drainage, $35,000 for moving and $185,000 for cranes for handling equipment. The main new building facing Pacific boulevard will be 360x720 feet, giving the company about a half mile frontage of buildings on Pacific.

The company publishes its own house organ called "The Consolidator," and sponsors and encourages athletic events among its employees, and maintains a relations officer on full time keeping in friendly contact with the employees' advising, assisting and working with them in solving their problems, and maintaining sympathetic relations between all branches of the institution.

Factory Growth Demands 64 Airfield Acres

By the Aviation Editor of The Christian Science Monitor

News in Aviation

An airplane factory outgrown by inability to handle orders rather than by obsolesence, accounts for outlay which Consolidated Aircraft of San Diego, Calif., has undertaken. A Consolidated factory less than five years' old, which is located on 24.7 acres of Lindbergh Field, the City's municipal airport, will be expanded with buildings, laboratories, and yard areas to occupy a space of 64 acres.

Consolidated's growth is typical of aircraft manufacturing in southern California, due to the demand for armament both at home and abroad. Received from the Navy Department on Dec. 20, 1939, was a contract for $20,016,699, which increased the backlog of the firm's unfilled orders to $40,000,000.

Inasmuch as present orders utilize plant capacity, Consolidated makes the expansion to meet the terms of the Naval contract. Included in the project is an assembly building which will cover an indoors area 360 feet by 720 feet, with a clear span of 120 feet and a clearance from floor to the bottom of the roof trusses of 36 feet. In addition, much of the yard will be asphalted, for use in final assembly operations outdoors.

FARM BUREAU HEARS COUNTY OFFICIALS

Lakeside Farm Bureau dinner meeting was held last night as the Farmer went to press. Principal speakers programmed by Chairman Clarence Foster were Supervisor W. T. Hart, Assessor Crowell Eddy, Tax Collector Sam Claggett and County Auditor Robert W. Getty.. A sound movie was also to be shown by Field Sec. Frank Weaver of Consolidated Aircraft Company, San Diego.

LE CONSOLIDATED « GUBA ».

Le premier utilisateur civil de l'hydravion *Consolidated PBY-1* fut, en 1937, le professeur Richard Archbold, membre de recherche du Muséum d'Histoire naturelle des États-Unis et fils d'un des principaux directeurs de la *Standard Oil Co*, qui en acquit un exemplaire en vue d'une exploration systématique de la Nouvelle-Guinée hollandaise.

Au cours d'un vol demeuré fameux, puisqu'il constituait la première traversée du continent nord-américain par un hydravion, le « *Guba* », nom donné à l'hydravion par son propriétaire, franchit, les 24 et 25 juin 1937, en $17^{h}3^{min}$, les 4350^{km} séparant San Diego de New-York par Dallas, Cincinnatti et Pittsburgh; le but du voyage étant de permettre aux ingénieurs de *Bendix* d'installer et d'essayer les appareils radio-électriques du bord.

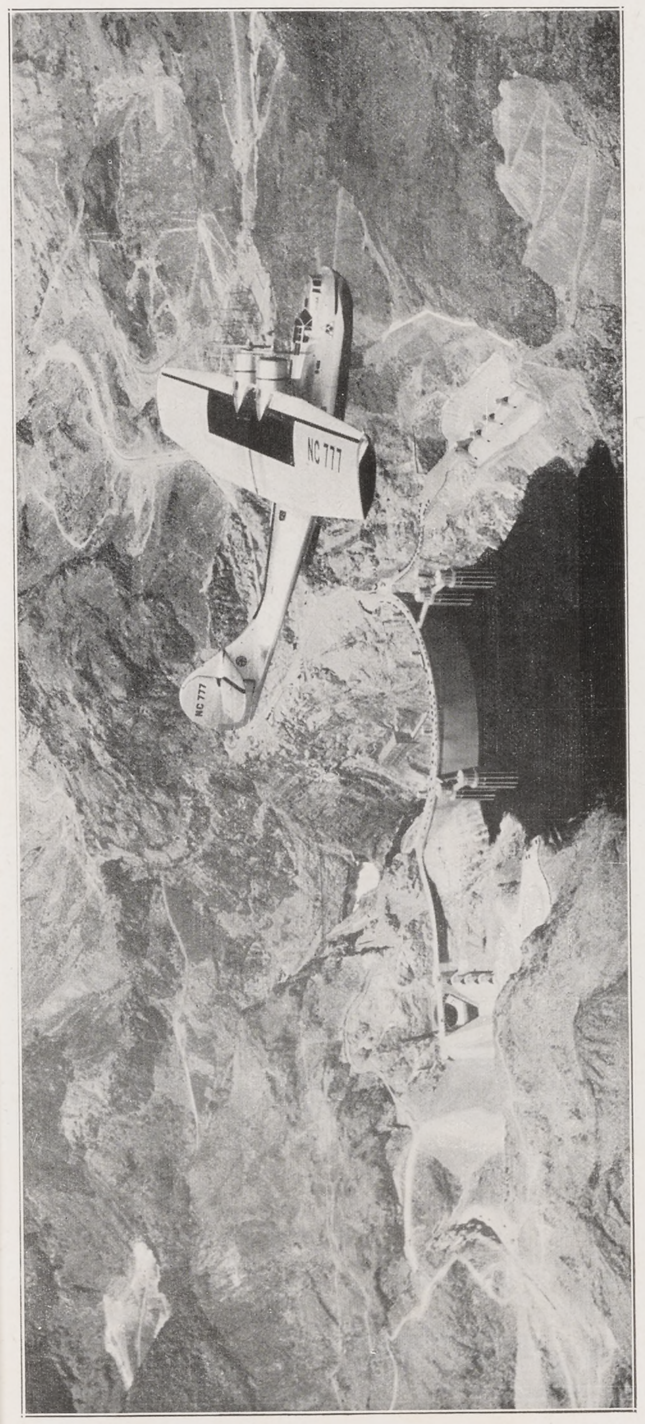
En août 1937, le Dr Archbold céda l'appareil à Sir Hubert Wilkins pour permettre à celui-ci de procéder à la recherche de l'aviateur soviétique Sigismund Levaneffsky, perdu dans les glaces polaires. C'est ainsi que Sir Wilkins, accompagné du commodore Herbert Hollick-Kenyon et de MM. G. Brown (mécanicien habituel du « *Guba* »), R. Booth et Al. Cheeseman, vola de New-York à Copper Mine, puis à Aklavik, d'où il sillonna les territoires du Nord-Ouest canadien, parcourant environ $30\,000^{km}$ au-dessus des régions arctiques.

Richard Archbold fit alors l'acquisition d'un autre *Consolidated*, du type *PBY-2*, qu'il baptisa également « *Guba* ».

La description complète de l'aménagement du « *Guba* » demanderait à elle seule de longues pages et sortirait du cadre de cet article. Qu'il suffise de préciser qu'outre un *gyropilot Sperry* et un équipement exceptionnellement complet de navigation et de p. s. v., le « *Guba* » était pourvu d'une installation radio-électrique unique en son genre : un émetteur principal, un émetteur auxiliaire, deux récepteurs (pouvant servir au radioguidage) et un radiogoniomètre; un réseau téléphonique reliant les membres de l'équipage entre eux et avec le poste radiotélégraphique et permettant l'intercommunication à bord et la connexion de n'importe quel homme d'équipage avec n'importe lequel des émetteurs ou récepteurs; un appareillage permettant à l'hydravion en vol de communiquer avec les explorateurs laissés à terre et porteurs de deux appareils *Bendix* constitués de trois éléments de 20^{kg} chacun.

Sur le nouveau « *Guba* », le Dr Archbold franchit les 3700^{km} séparant San Diego de Miami une première fois le 3 décembre 1937 en $14^{h}10^{min}$, une seconde le 26 février 1938 en $12^{h}35^{min}$.

Il commença son véritable voyage en juin 1938. Avec un équipage composé du capitaine L. A. Yancey et de MM. R. Rogers, S. Barrinka, G. Brown et R. Booth, il parcourut les étapes suivantes : 3 juin 1938, San Diego-Pearl Harbour (4108^{km} en $18^{h}7^{min}$);



Le bimoteur CONSOLIDATED « GUBA » *du professeur Richard Archbold, à moteurs* PRATT AND WHITNEY « TWIN WASP » *de* 1000^{ch}, *survolant le* BOULDER DAM.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

Speaking of rivets, there are from a quarter to a half million rivets in every machine, and they make them themselves with intricate machines that shoot them out by the thousands, all lengths, sizes and dimensions. Some planes now under construction have a wing spread of 115 feet and weigh 55,000 pounds.

The metal used is mostly aluminum, mixed with a little copper and other metals for strength and plated and "electrocuted" to prevent rust and erosion.

One of the recent additions to their equipment is a 4500-ton hydraulic press, built especially for the company at a cost of $100,000 and which can

STIRRING THE NEWS HOPPER

(Continued From Page One)

apply pressure equal to the weight of a warship. These huge presses are mounted on strong springs to prevent knocking the building down when they are in operation.

In the painting department the rooms are air conditioned, with suction fans pulling the fumes outdoors while others keep the air fresh and moving.

The automatic machines making each separate piece of the 50,000 units, aside from screws, bolts, nuts and rivets, which go into the construction of a plane, keep grinding away throughout the day and night, and more than $2,000,000 worth of parts are now in the store rooms, ready to be delivered on requisition to the assembling sections.

The company carries health, accident and death insurance on all employees desiring it, at a cost far below similar insurance available elsewhere. The sick benefits amount to $15 a week for thirteen weeks to employees earning $1,000 a year, and more for those earning up to $3,000. There are $4,000,000 in risks now being carried.

In the annual report of President Fleet to the shareholders, just issued today, the net earnings of the company for 1939 were placed at $1,104,327. New production facilities to cost $2,000,000 are to be provided immediately, $1,150,000 for new buildings, $530,000 for new machinery and equipment, $100,000 for yard paving and drainage, $35,000 for moving and $185,000 for cranes for handling equipment. The main new building facing Pacific boulevard will be 360x720 feet, giving the company about a half mile frontage of buildings on Pacific.

The company publishes its own house organ called "The Consolidator," and sponsors and encourages athletic events among its employees, and maintains a relations officer on full time keeping in friendly contact with the employees' advising, assisting and working with them in solving their problems, and maintaining sympathetic relations between all branches of the institution.

Factory Growth Demands 64 Airfield Acres

By the Aviation Editor of The Christian Science Monitor

News in Aviation

An airplane factory outgrown by inability to handle orders rather than by obsolesence, accounts for outlay which Consolidated Aircraft of San Diego, Calif., has undertaken. A Consolidated factory less than five years' old, which is located on 24.7 acres of Lindbergh Field, the City's municipal airport, will be expanded with buildings, laboratories, and yard areas to occupy a space of 64 acres.

Consolidated's growth is typical of aircraft manufacturing in southern California, due to the demand for armament both at home and abroad. Received from the Navy Department on Dec. 20, 1939, was a contract for $20,016,699, which increased the backlog of the firm's unfilled orders to $40,000,000.

Inasmuch as present orders utilize plant capacity, Consolidated makes the expansion to meet the terms of the Naval contract. Included in the project is an assembly building which will cover an indoors area 360 feet by 720 feet, with a clear span of 120 feet and a clearance from floor to the bottom of the roof trusses of 36 feet. In addition, much of the yard will be asphalted, for use in final assembly operations outdoors.

AND NAVAL POLICY

By Rear Adm. John H. Towers, USN

THE mission of Naval Aviation in our national defense is, primarily, to increase the efficiency of the naval service.

The basic principle of the national policy of the United States is that our armed forces are maintained for defense purposes, and the basic principle of the Navy policy is to maintain our Navy at sufficient strength to support the national policies and commerce, and to guard the continental and overseas possessions of the United States. To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. THE mission of Naval Aviation in our national defense is, primarily, to increase the efficiency of the naval service.

The basic principle of the national policy of the United States is that our armed forces are maintained for defense purposes, and the basic principle of the Navy policy is to maintain our Navy at sufficient strength to support the national policies and commerce, and to guard the continental and overseas possessions of the United States. To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

Speaking of rivets, there are from a quarter to a half million rivets in every machine, and they make them themselves with intricate machines that shoot them out by the thousands, all lengths, sizes and dimensions. Some planes now under construction have a wing spread of 115 feet and weigh 55,000 pounds.

The metal used is mostly aluminum, mixed with a little copper and other metals for strength and plated and "electrocuted" to prevent rust and erosion.

One of the recent additions to their equipment is a 4500-ton hydraulic press, built especially for the company at a cost of $100,000 and which can

STIRRING THE NEWS HOPPER

(Continued From Page One)

apply pressure equal to the weight of a warship. These huge presses are mounted on strong springs to prevent knocking the building down when they are in operation.

In the painting department the rooms are air conditioned, with suction fans pulling the fumes outdoors while others keep the air fresh and moving.

The automatic machines making each separate piece of the 50,000 units, aside from screws, bolts, nuts and rivets, which go into the construction of a plane, keep grinding away throughout the day and night, and more than $2,000,000 worth of parts are now in the store rooms, ready to be delivered on requisition to the assembling sections.

The company carries health, accident and death insurance on all employees desiring it, at a cost far below similar insurance available elsewhere. The sick benefits amount to $15 a week for thirteen weeks to employees earning $1,000 a year, and more for those earning up to $3,000. There are $4,000,000 in risks now being carried.

In the annual report of President Fleet to the shareholders, just issued today, the net earnings of the company for 1939 were placed at $1,104,327. New production facilities to cost $2,000,000 are to be provided immediately, $1,150,000 for new buildings, $530,000 for new machinery and equipment, $100,000 for yard paving and drainage, $35,000 for moving and $185,000 for cranes for handling equipment. The main new building facing Pacific boulevard will be 360x720 feet, giving the company about a half mile frontage of buildings on Pacific.

The company publishes its own house organ called "The Consolidator," and sponsors and encourages athletic events among its employees, and maintains a relations officer on full time keeping in friendly contact with the employees' advising, assisting and working with them in solving their problems, and maintaining sympathetic relations between all branches of the institution.

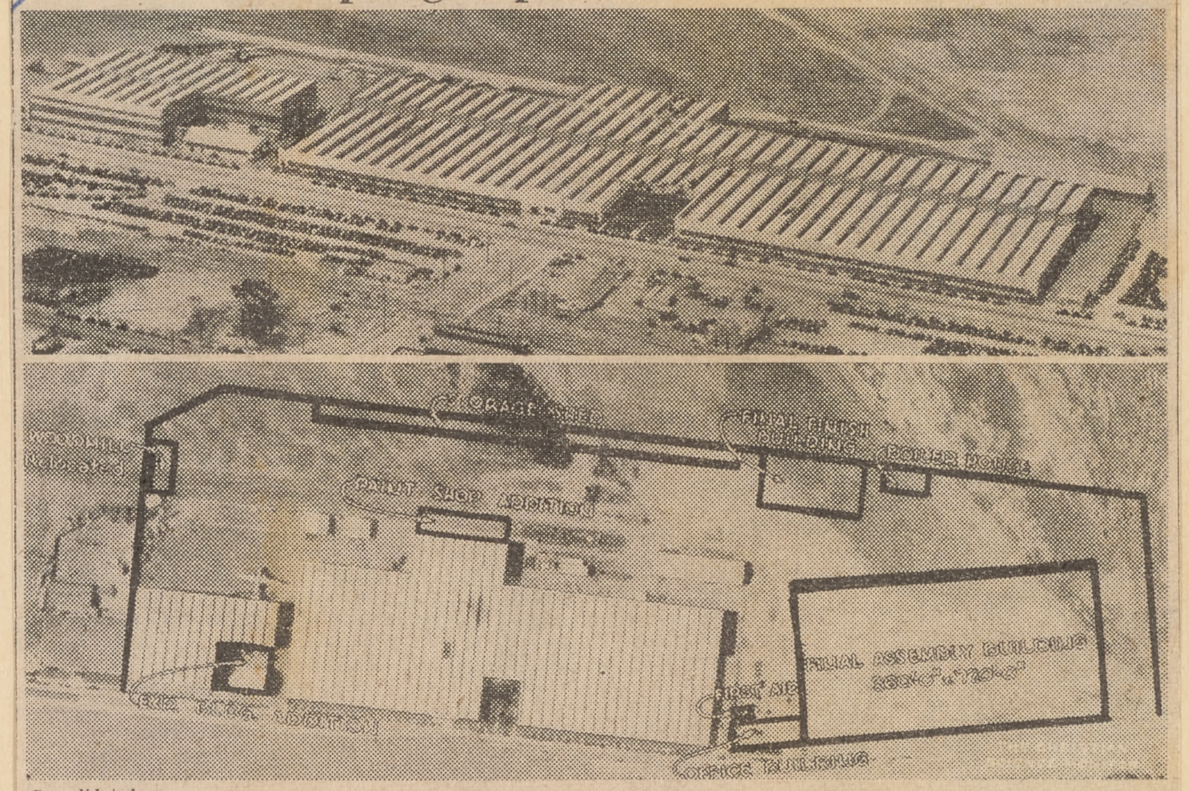
Keeping Up With the Navy



Consolidated

Airplane Shop and Expansion

Upper: View of present plant of Consolidated Aircraft Corporation at San Diego, Calif. Lower: Scheme (drawn on smaller scale than upper picture) for expanded plant, showing, at right, where steel canopy for Naval assembly will be erected; and at back, where final finish building and long storage shed will stand.

Factory Growth Demands 64 Airfield Acres

By the Aviation Editor of The Christian Science Monitor

An airplane factory outgrown by inability to handle orders rather than by obsolesence, accounts for outlay which Consolidated Aircraft of San Diego, Calif., has undertaken. A Consolidated factory less than five years' old, which is located on 24.7 acres of Lindbergh Field, the City's municipal airport, will be expanded with buildings, laboratories, and yard areas to occupy a space of 64 acres.

Consolidated's growth is typical of aircraft manufacturing in southern California, due to the demand for armament both at home and abroad. Received from the Navy Department on Dec. 20, 1939, was a contract for $20,016,699, which increased the backlog of the firm's unfilled orders to $40,000,000.

News in Aviation

Inasmuch as present orders utilize plant capacity, Consolidated makes the expansion to meet the terms of the Naval contract. Included in the project is an assembly building which will cover an indoors area 360 feet by 720 feet, with a clear span of 120 feet and a clearance from floor to the bottom of the roof trusses of 36 feet. In addition, much of the yard will be asphalted, for use in final assembly operations outdoors.

FARM BUREAU HEARS COUNTY OFFICIALS

Lakeside Farm Bureau dinner meeting was held last night as the Farmer went to press. Principal speakers programmed by Chairman Clarence Foster were Supervisor W. T. Hart, Assessor Crowell Eddy, Tax Collector Sam Claggett and County Auditor Robert W. Getty.. A sound movie was also to be shown by Field Sec. Frank Weaver of Consolidated Aircraft Company, San Diego.

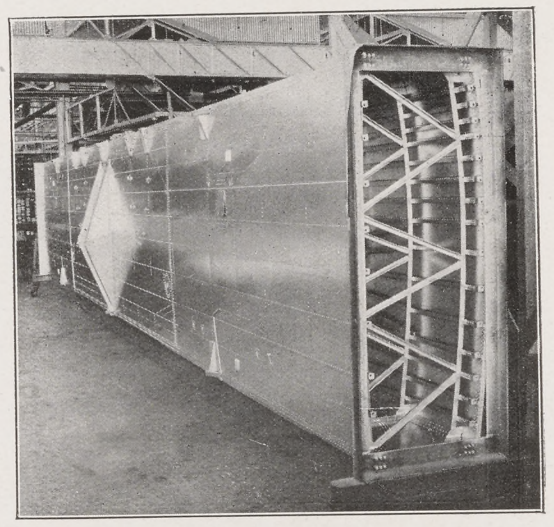
DESCRIPTION DU PBY.

L'hydravion de patrouille et de bombardement *PBY* est un monoplan bimoteur à coque, entièrement construit en alliage léger.

L'aile, semi-cantilever, est reliée à la coque par une cheminée centrale, qui remplace l'ensemble de mâts du *P 2 Y*, et étayée de part et d'autre par une paire de mâts carénés. Elle est construite en trois parties : une partie centrale, de section constante, contenant les réservoirs d'essence et portant les fuseaux-moteurs, et deux tronçons latéraux, de section décroissante, démontables mais non repliables, et recevant les ballonnets. La charpente est à deux longerons, avec revêtement travaillant renforcé par des raidisseurs en Z. Le bord d'attaque et le bord de fuite sont démontables; le bord d'attaque contient les organes de commande des moteurs, les canalisations d'essence et d'huile et les phares d'amerrissage. Des chemins de marche permettant l'inspection et l'entretien des ailes entre les longerons pour la partie centrale, au-dessus du longeron avant pour les tronçons latéraux : ce sont les surfaces de l'extrados qui apparaissent en noir sur les photographies des pages 677 et 679.

Les ailerons, compensés statiquement et aérodynamiquement, sont construits en caisson et revêtus par entoilage; l'aileron gauche est muni d'un volet correcteur, réglable en vol.

Les flotteurs, innovation particulièrement originale de *Consolidated*, sont latéralement relevables, construits en aluminium et séparés en trois compartiments par des cloisons étanches (*voir* phot.,



Aspect, en fin de construction, du segment central de voilure du PBY.

Ci-contre, aspect des cabines destinées à l'équipage du PBY.

En haut, aspect d'arrière en avant; *en bas*, aspect d'avant en arrière. C'est à la partie antérieure de la cabine, formant le fond du cliché supérieur, qu'est installé le poste de contrôle et de commande des moteurs.

An airplane factory outgrown by inability to handle orders rather than by obsolesence, accounts for outlay which Consolidated Aircraft of San Diego, Calif., has undertaken. A Consolidated factory less than five years' old, which is located on 24.7 acres of Lindbergh Field, the City's municipal airport, will be expanded with buildings, laboratories, and yard areas to occupy a space of 64 acres.

Consolidated's growth is typical of aircraft manufacturing in southern California, due to the demand for armament both at home and abroad. Received from the Navy Department on Dec. 20, 1939, was a contract for $20,016,699, which increased the backlog of the firm's unfilled orders to $40,000,000.

Inasmuch as present orders utilize plant capacity, Consolidated makes the expansion to meet the terms of the Naval contract. Included in the project is an assembly building which will cover an indoors area 360 feet by 720 feet, with a clear span of 120 feet and a clearance from floor to the bottom of the roof trusses of 36 feet. In addition, much of the yard will be asphalted, for use in final assembly operations outdoors.

AND NAVAL POLICY

By Rear Adm. John H. Towers, USN

THE mission of Naval Aviation in our national defense is, primarily, to increase the efficiency of the naval service.

The basic principle of the national policy of the United States is that our armed forces are maintained for defense purposes, and the basic principle of the Navy policy is to maintain our Navy at sufficient strength to support the national policies and commerce, and to guard the continental and overseas possessions of the United States. To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

Stirring The News Hopper

By the Roving Reporter

San Diego's Consolidated

San Diego's Consolidated Aircraft factory is employing 4300 men and women, carrying a payroll of $150,000 a week, or $600,000 a month, which figures about $7,500,000 a year.

They are adding new employees at the rate of 100 a week, and just now are increasing their factory capacity with buildings and mechanical equipment to almost double its present size to take care of a backlog of orders aggregating $43,000,000. They hope to be in full operation by late summer when they will be employing between 7,000 and 8,000 men and women, with a corresponding increase in its weekly payroll, which will mean a lot of potatoes for San Diego and vicinity.

Since most of the company's orders are for government planes from this and other countries, their operations are largely of a secret and confidential nature, and to get inside the doors of the factory one is required to pass approval of the army and navy and have some one, known to the company, who is willing to vouch for one's "safety."

The Consolidated designs its own planes, and one of the principal reasons, for its phenomenal success in meeting world competition is because its product is superior in construction, range, speed, and I might say "fighting ability." Naturally, these new improvements which go into the making of Consolidated planes are valuable secrets and constitute an important element in what the customer pays for when he buys a Consolidated machine. If the French government, for example, orders a Consolidated bomber because it is speedier and more dangerous than a German bomber, they don't want anybody around the factory tipping off the secrets to the Germans.

So it was just an accident that got me into the factory Monday. Maj. R. H. Fleet, president and manager, barged into the office of Secretary T. C. Macaulay of the chamber of commerce where I was hunting news, and quicker than I can tell it I was on the way to the factory. Maj. Fleet displayed no uneasiness about the possibility of my being able to reveal any intricate mechanical secrets, but it was necessary to sign a "pledge," and have a green card stuck in my hatband so they could distinguish me from a spy or a member of the Workers Alliance.

Consolidated recruits its new employees from aviation schools throughout the country and their family records are checked and double checked and put through a wringer to make sure that there is not the wrong kind of Red in their blood corpuscles .They are then required to sign an application solemnly swearing that they are American citizens and will reveal nothing in the factory that may be of injury to the United States, or divulge information to the advantage of any foreign nation and against the interests of our national defense. They are reminded in writing of the provisions of the espionage act in which a violation involves the penalty of a $10,000 fine or imprisonment for two years.

Under these precautions, the type and character of the men observed in the factory are noticeably of high intelligence, dependable, conscientious, and therefore of cheerful appearance and worthy of confidence. There was a feeling of wholesome atmosphere about the place in which the men seemed contented, interested in what they were doing, and proud of their production. The production manager who showed me through the factory greeted his men with a genial salute and a friendly word which was returned in kind, and there were no exceptions from the engineers and the chemists to the boys who were driving rivets and spraying paint.

Speaking of rivets, there are from a quarter to a half million rivets in every machine, and they make them themselves with intricate machines that shoot them out by the thousands, all lengths, sizes and dimensions. Some planes now under construction have a wing spread of 115 feet and weigh 55,000 pounds.

The metal used is mostly aluminum, mixed with a little copper and other metals for strength and plated and "electrocuted" to prevent rust and erosion.

One of the recent additions to their equipment is a 4500-ton hydraulic press, built especially for the company at a cost of $100,000 and which can

STIRRING THE NEWS HOPPER

(Continued From Page One)

apply pressure equal to the weight of a warship. These huge presses are mounted on strong springs to prevent knocking the building down when they are in operation.

In the painting department the rooms are air conditioned, with suction fans pulling the fumes outdoors while others keep the air fresh and moving.

The automatic machines making each separate piece of the 50,000 units, aside from screws, bolts, nuts and rivets, which go into the construction of a plane, keep grinding away throughout the day and night, and more than $2,000,000 worth of parts are now in the store rooms, ready to be delivered on requisition to the assembling sections.

The company carries health, accident and death insurance on all employees desiring it, at a cost far below similar insurance available elsewhere. The sick benefits amount to $15 a week for thirteen weeks to employees earning $1,000 a year, and more for those earning up to $3,000. There are $4,000,000 in risks now being carried.

In the annual report of President Fleet to the shareholders, just issued today, the net earnings of the company for 1939 were placed at $1,104,327. New production facilities to cost $2,000,000 are to be provided immediately, $1,150,000 for new buildings, $530,000 for new machinery and equipment, $100,000 for yard paving and drainage, $35,000 for moving and $185,000 for cranes for handling equipment. The main new building facing Pacific boulevard will be 360x720 feet, giving the company about a half mile frontage of buildings on Pacific.

The company publishes its own house organ called "The Consolidator," and sponsors and encourages athletic events among its employees, and maintains a relations officer on full time keeping in friendly contact with the employees' advising, assisting and working with them in solving their problems, and maintaining sympathetic relations between all branches of the institution.

Aspect en vol du quadrimoteur prototype de bombardement et de patrouille CONSOLIDATED X. PB 2 Y-1 *sous sa forme définitive, c'est-à-dire avec deux jeux de plans de queue verticaux installés aux extrémités d'un stabilisateur accusant un dièdre accentué vers le haut.*

Deux postes de combat à tourelle orientable sont installés l'un à la proue, l'autre à l'extrême arrière sous les gouvernes horizontales.

Derrière l'aile, se trouve, un poste de navigation, dont les vues, largement dégagées vers le ciel, facilitent les observations astronomiques.

L'appareil est tout spécialement adapté aux missions de longue durée et, à ce titre, équipé pour rester longtemps loin de toute base. Il est pourvu d'un train de roues destiné à la mise à flot, dont les roues sont normalement remisées dans des logements ménagés à cet effet dans la coque. L'aménagement intérieur et le confort ont été l'objet d'un soin particulier : l'équipage, normalement composé de 7 à 12 hommes suivant les missions, dispose d'une cabine, de toilettes et de dortoirs spacieux et insonorisés, ainsi que d'une cuisine avec frigidaire; l'air est renouvelé par des ventilateurs et conditionné en température; un réseau téléphonique réunit tous les habitacles. Des génératrices, actionnées par deux moteurs auxiliaires, fournissent un courant alternatif de 110 volts.

A l'heure actuelle, le *PB 2 Y* n'a pas encore fait l'objet d'une commande de l'*U. S. Navy*.

Selon le constructeur, une version civile du *PB 2 Y* pourrait transporter 30 passagers, avec un rayon d'action maximum de 8000^{kn} et une vitesse maximum de 385$^{km/h}$.

Le bimoteur Consolidated 31.

LE PROTOTYPE.

Le dernier né de la *Consolidated Aircraft Corporation*, le *Consolidated* 31, a effectué son premier vol le 5 mars 1939 après dix mois seulement d'études et de construction.

Cet appareil semble être surtout un prototype expérimental sans équipement spécial, avant-coureur de longs-courriers commerciaux et de bombardiers militaires, et peut-être une sorte de maquette volante préparant la construction du quadrimoteur de 50^t « *Trans-Oceanic* » pour 54 passagers et celle du sextimoteur de 77^t pour 100 passagers.

Selon le constructeur, le *Consolidated* 31 peut porter 52 passagers de jour et, au-dessus de l'Atlantique, 28 passagers de jour et de nuit.

DESCRIPTION.

Le *Consolidated* 31 est un monoplan entièrement construit en duralumin, avec revêtement général en aluminium avec rivets à tête noyée et entoilage des surfaces mobiles.

L'aile, entièrement cantilever, porte les fuseaux-moteurs et des ballonnets latéraux, non basculants comme pour le *PBY* et le *PB 2 Y*, mais remontant verticalement jusqu'à l'intrados. Cette aile — et

3/15/40

c'est là, semble-t-il, la plus grosse originalité de l'appareil — est à profil extra-mince donnant pratiquement un écoulement laminaire sur toute la surface. Il est logique de référer cette innovation à un travail du *N. A. C. A.* sur les profils de ce type, travail dont le Dr G. W. Lewis, directeur du *N. A. C. A.*, a donné lecture lors d'un récent congrès de ce comité.

L'aile est pourvue de volets *Fowler* à commande hydraulique sur toute la partie du bord de fuite non occupée par les ailerons. Les réservoirs d'essence sont contenus dans la partie centrale de l'aile; leurs parois constituent les surfaces mêmes d'extrados et d'intrados.

La coque, à flancs plats et de section haute, comporte deux ponts. Le pont supérieur est réservé à un équipage normalement constitué par 5 hommes (un chef de bord assurant le contrôle des moteurs, deux pilotes, un radio-opérateur et un navigateur. Le pont inférieur comporte huit compartiments pour les passagers ou le fret.

Comme le *X. PB 2 Y*, le *Consolidated* 31 possède un train de roulement à trois roues escamotables, pour la mise à flot et la manœuvre au sol.

Les moteurs sont des *Wright* « *Duplex Cyclone* » à 18 cylindres en étoile double, refroidis par l'air et développant 2000^{ch} au décollage; ils actionnent des hélices *Hamilton* « *Hydromatic* » de $4^{m},88$ de diamètre, à vitesse constante et mise en drapeau automatique.

Spécialement équipé pour les vols de grandes distances, c'est-à-dire avec des réservoirs supplémentaires dans la coque, l'appareil aurait un rayon d'action de $19\ 300^{km}$; c'est dire que pratiquement il pourrait se rendre sans escale de n'importe quel point du globe à n'importe quel autre point.

To do this, the Navy must be properly equipped with ships, aircraft, and trained personnel. The equipment must be modern and in sufficient quantity successfully to carry out the required and assigned missions.

World conditions in recent years have not improved, and the United States, to safeguard its interests, has been forced to continue construction under the Vinson-Trammell Act of 1934 and the Naval Expansion Act of 1938.

While the governing policy is defensive, it is imperative, in the event that war is forced upon us, that our fleet shall be able to bring the enemy to terms at a safe distance from our shores within the shortest possible interval of time. To accomplish this feat, it must be adequately trained and sufficiently strong in every essential element.

The present authorized building program of ships, planes, and naval air stations is a step in the right direction and should be pushed to an early completion. So, too, should the program of construction of other air, destroyer, and submarine bases recommended during the current calendar year by the Hepburn Board.

The Naval policy in regard to heavier-than-air aviation activities is to build and maintain airplanes to the full complement authorized for aircraft carriers, tenders, battleships, cruisers, and the Fleet Marine Force, and to determine and develop the types of airplanes and appliances which are best suited for increased effectiveness of naval vessels, attacks on all classes of Naval objectives, and for scouting and patrolling.

Aircraft For Increased Effectiveness

An adjunct to this general policy is the aircraft policy which aims to build and to maintain aircraft carriers in the maximum

Aircraft News

HUGE ORDER FOR BOMBERS BY FOREIGNERS

3-28-40.

SAN DIEGO—Consolidated Aircraft Corporation officials disclosed that construction of PBY-type patrol bombers similar to those used by the United States Navy has been started for foreign nations—presumably the Allies. The contract is believed to involve a $9,000,000 expenditure.

The local concern, in the midst of a $200,000 erpansion program and boasting the largest backlog in its history—$49,00,000—confirmed a statement by Rear Admiral John H. Towers, Bureau of Aeronautics chief, in Washington, that the twin-engined Consolidated planes are one of four types of Navy aircraft approved for export to the Allies.

Total to $49,000,000

Maj. Reuben H. Fleet, president of Consolidated, declared that orders recently received from abroad—believed to be England and France—raised the company's amount of unfinished work to approximately $49,000,000.

He refused to divulge the exact number of planes involved, declaring he was sworn to secrecy by the purchasers.

The PBY type is one of the most famous seaplanes in the world, having effected trail-blazing mass flights from San Diego to the Canal Zone and Honolulu and from Hawaii to the Philippines.

Archbold's Flights

A $250,000 commercial version, owned by Richard Archbold, wealthy explorer-aviator, was used with an American Museum of Natural History expedition in operations from a mountain lake in Netherlands New Guinea last year and later flew around the world, the first seaplane to cross Australia, the Indian Ocean and Africa.

John Millar, Consolidated Aircraft Corporation's London representative, has just arrived in San Diego for conferences related to the British contract, it was learned recently.

BOMBER ON LINE FOR INSPECTION AS ARMY DAY EVENT

San Diego's observance of Army day Saturday will feature aviation, with the public invited to visit Lindbergh field from 9:30 a.m. to 4 p.m. to inspect army planes and equipment and national guard anti-aircraft equipment. A feature of the exhibit will be Consolidated's new four-motored army bomber, which will be on the line for public inspection, it was reported.

Open house will be held at the air corps reserve hangars at the south side of the municipal airport, with all the planes lined up for inspection, according to report by Maj. Gen. R. R. Van Deman, U.S.A. ret., chairman of the military affairs committee of the chamber of commerce. Open house also will be held at the Ryan School of Aeronautics, with army air corps cadets acting as guides for tours of inspection of training planes and through the school.

The national guard will have on Lindbergh field four new anti-aircraft guns, two 800,000,000 candlepower searchlights; modern aircraft radio sets, and trucks, including a big wire-laying truck.

Army to Exhibit Consair Bomber

San Diegans on Army day, Saturday, will have an opportunity to inspect the huge, four-motored bomber built by Consolidated Aircraft Corp. for the army air corps.

Maj. Gen. R. H. Van Deman, U.S.A., ret, chamber of commerce military affairs committee chairman, said the bomber will be on exhibition at Lindbergh field from 9:30 a.m. to 4 p.m.

The municipal airport also will be the scene of other Army day attractions, Gen. Van Deman said.

Open house will be held at the army air corps reserve hangars and at Ryan School of Aeronautics where air corps cadets will act as guides for an inspection tour of the school and the training planes.

The national guard will exhibit four new anti-aircraft guns, a wire laying truck, aircraft radio sets and two 800,000,000-candlepower searchlights.

Army air corps authorities at March and Moffett fields have been requested to put on display at Lindbergh field pursuit, attack and observation planes.

Air Plants Take 90 a Week From S. D. School

4-4-40.

Gearing its operations to the absorption power of the aircraft industry here, the Vocational school is admitting 90 aviation students a week and releasing that number for employment, H. A. Tiemann, director of vocational education, reported yesterday.

He said the goal is 150 a week but will not be reached unless an equivalent number of aviation industry jobs are in sight.

"Cooperation between employers and the school is excellent," he said. "Preference is given to locally trained youths by the employment offices of all our local aviation plants."

The general pick-up of employment also has helped place students from other departments of the school in various types of employment, he added.

Since July 1, 460 students have been played in full-time employment, 324 in aircraft plants, 65 in retail selling and business occupations, 20 in welding work, 20 in machine shops, 19 as sign painters and show-card writers, 7 in auto repair shops and 5 in woodworking occupations, Tiemann reported.

"Without vocational education a majority of these young men and women would in all probability still be unemployed and our community would not be receiving the benefit of over $500,000 in earning power they are now producing," he concluded.

WITH ITS WHEELS DOWN

Amphibian for Coastal Patrols

NOW undergoing tests at U.S. Naval Air Station, Anacostia, D.C., is the Consolidated Model 28 flying boat in its amphibian version. The company's designation is Model 28-5A, while the Navy number is XPBY-5A.

The tricycle undercarriage is fully retractable, the main wheels going into the sides of the hull and bow wheel into a completely enclosed hatch in the planing bottom. Automatic means are provided to eject all water in this hatch before the plane is in the air.

This boat, now that it is an amphibian, should make a magnificent unit for coastal patrol work. It has a great advantage over a flying boat for such work in that it can be serviced at much less elaborate bases. All that an amphibian needs for a base is a ramp; it can climb and descend it under its own power. Patrol work on the very long coastlines of Canada and Australia could be done most efficiently with such equipment.

Fleet Buys Kinner Engines

Confident that the neutrality ban will be modified, Fleet Aircraft Ltd., of Ft. Erie, Canada, ordered $83,000 worth of aircraft engines from Kinner Motors, of Los Angeles. Fifty engines are contracted for and the order was accompanied by a letter of credit assuring payment even though the engines may have to be stored. This will be done until such time as Fleet may legally take delivery Kinner officials stated. Aero Digest 10/39

Archbold Will Lecture Here Monday

"Round the World on Biological Exploration" will be the theme of Richard Archbold's special lecture in the auditorium, House of Hospitality, Monday night at 8.

Bringing color and sound motion pictures and a collection of slides, the noted explorer will tell of his New Guinea expedition and round-the-world flight on the "Guba," famous San Diego-built flying laboratory. A research associate of the American Museum of Natural History, Archbold made nation-wide news when he hopped from San Diego sometime ago in the "Guba" on her maiden flight. Since then, the young research scientist has contributed many specimens to museums and has published a book.

ADMISSION BY TICKET

The lecture, under auspices of Fellows of the San Diego Society of Natural History, was originally scheduled for the Natural History museum. Because of interest shown it will be held in an auditorium which seats about 600.

"Admission will be by ticket only," Clinton G. Abbott, museum director stated, "in order to assure all members admittance." Anyone having a membership card will be permitted to bring two friends. Persons not already members of the society who care to join in advance of the lecture will be welcomed.

ATTAINMENTS RECOUNTED

Archbold, of New York and San Diego, resides at present at Tanque Verde ranch, Ariz. His south sea work interrupted by war, he has lately been engaged in ecological investigation, study of effects of desert conditions on mammal life.

Besides his biological research, Archbold was the first white man to discover an unknown tribal "nation" in Dutch New Guinea interior, and first to fly a "flying boat" over the Indian ocean. He surveyed and demonstrated the possibilities of a new air-route from Australia to England via Africa.

Consolidated Expands

Last December Consolidated Aircraft was sitting pretty, with a $20,000,000 backlog that promised to use the full capacity of the five-year old 25-acre plant at San Diego. Then, at one blow, the biggest single aircraft order ever placed by the government doubled Consolidated's backlog and threw a real production problem on their hands.

Now comes the announcement of an 87% increase in factory space to provide the needed capacity. An additional 64 acres have been leased or optioned, d 400,000 sq. ft. will be ed. New facilities will in- e final assembly, final finish, paint shop and wood mill, and experimental, maintenance, and office space. Extra assembly space is also to be provided by paving yard areas, since well-known California climate permits outdoor work most of the year.

Under a closing agreement with the Treasury, part of the cost of expansion is to be charged against the government order.

AVIATION, APRIL 1940

Consolidated Aircraft directors have decided not to make a dividend payment for the present, in order to retain company funds within the business and avoid issuance of additional stock. Unannounced foreign orders amounting to $7,000,000 were recently received for an export version of the "PBY" bomber used by the Navy. Backlog includes $20,000,000 in flying boats for the Navy, and $12,000,000 in four-engine bombers for the Air Corps.

AVIATION - MARCH '40

REPORT CARD

Of Air School

With thousands of new men needed for Southern California aircraft factories, the aviation schools of that section have been hard pressed to provide enough skilled men. Every school and factory has cooperated to make the expansion process as orderly as possible. At Lockheed an extensive employee training program is in full swing. In San Diego, where Consolidated Aircraft Corporation is currently doubling its factory facilities and both Solar and Ryan are hiring steadily, the vocational schools of the city have taken a hand in the training program, offering six-week courses designed to teach aircraft shop fundamentals to 2000 young men by July 1st. Ryan School of Aeronautics has expanded its course to include a six-week mechanic course, and has inaugurated a number of new training programs, including a course for parachute riggers.

Archbold Thrills Audience With Flight Films

By CURTIS ZAHN

Bringing highlights of what you'd see on a 'round-the-world flight, Richard Archbold, flying scientific explorer, thrilled a capacity audience with a lecture and motion pictures last night in House of Hospitality, Balboa park.

Something of a streamlined travelog on the screen, Archbold's skillfully taken films, started—interestingly enough—at Lindbergh field, where the flying laboratory, Guba, took off.

275 LANGUAGES USED

In New Guinea, where the explorer contacted a heretofore unknown tribe, the natives were the least surprised of anybody.

"They seemed to take our airplane and guns as a matter of fact," Archbold stated, "but they were surprised at our inability to converse." On one island alone, he added, some 275 languages were spoken.

At another native village the exploring party had difficulty getting meat. Pigs were the only edible animals to be found, and they were highly prized—much more so than the money offered them, Archbold said.

"But they'd sell you anything," he added, "if you could find the right kind of sea-shells. The trouble was to find them."

PLANE HAD TROUBLES

Photographing tree-climbing kangaroos and wild orchids were just a few of the things the scientists found time for. They covered ground which previously had taken years. The plane had its difficulties, however. At Port Evans, they took on 15 gallons of gasoline and had to load it into five-gallon tins, rowing it out to the plane. This was made even more laborious by the fact that tides there averaged 30 feet.

In one inland trip, the Guba had to land and take off in an S-shaped slough little wider than its wingspread.

Leaving the Guineas, Archbold was asked to fly the Indian ocean as an experimental trip to map a new route. The trip, as is now known, was highly successful and practical.

YACHTS 150 YEARS OLD

In reviewing the native groups he'd contacted in various islands, Archbold stated that the Cocos islanders, numbering some 1400, were the happiest.

Of interest to yachtsmen were the close-ups of native sailing sloops. Built of solid teak on good lines, many of the craft were claimed to be 150 years old.

Archbold, who thrice has explored New Guinea, was introduced by J. D. Sefton, museum president. The lecture was sponsored by the San Diego Society of Natural History. A research associate of the American Society of Natural History, Archbold has cooperated substantially with the local museum and recently published his book, "New Guinea Expedition," at a local printing establishment.

New Consolidated

An official Army Air Corps release covering the new Consolidated XB-24 four-engine landplane bomber gives the plane a gross weight of 40,000 lbs., wing span 110 ft., length 64 ft., over-all height 19 ft., and with accomodations for a crew of six to nine men, depending on mission.

Performance estimates include a top speed of more than 300 miles per hour, range of approximately 3,000 miles, and bomb load capacity of about four tons. The plane is powered by four Pratt & Whitney 18-cylinder twin-row engines of 1200 h.p. each, and is propelled by Hamilton Standard 3-blade hydromatic constant speed propellers of 12 ft. diameter.

The wing is of the Davis airfoil type, with high aspect ratio and high mid-wing mounting on the fuselage. Construction is all-metal throughout, of stressed-skin design, with fabric covered control surfaces. Landing gear is of tricycle type, retractable. Fowler type trailing edge flaps extend the length of the wing inboard of the ailerons. Large bomb doors open in the belly and generous hatches and turrets are provided in nose, top, sides and rear of the fuselage.

High Wing Bomber

The Army's new Consolidated bombardment plane, XB-24, has just made its initial flight at Lindbergh Field, San Diego. It is powered with four Pratt & Whitney 18-cylinder twin-row radial engines rated at 1200 h.p. each. Propellers are Hamilton Standard three-blade hydromatic constant speed, 12 feet in diameter.

The XB-24 is a high-wing type, all metal construction, full cantilever high aspect ratio, with tractor nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard from the ailerons.

Consolidated Makes 1st Industry Closing Agreement Providing for Expansion Costs

First closing agreement negotiated by the Treasury Dept. with any aircraft manufacturer, and the second ever reached with any industrial firm, has been concluded with the Consolidated Aircraft Corp. of San Diego, it became known Dec. 20.

The agreement provides that for the period in which the company is engaged in a contract for the Navy Dept., Consolidated may charge off gainst federal taxes certain costs indent to performance of the conact. The company may charge as an ndirect factory expense the cost of tools used during that time and the depreciated cost, less salvage value, of certain buildings which must be demolished to fulfill the contract. This also may include the cost of demolition. Consolidated's plant expansion is understood to be about $2,000,000, an increase of 92% of floor area.

In general the agreement provides for proper deductions against taxes for expenses of plant expansions necessitated by contracts on national defense orders.

50,000 Planes Possible in Year, Says Aeronautical Chamber Head

Colonel Jouett Asserts Plants Are Geared for Expansion, With 100,000 Workers and Related Industries Ready

By tripling the floor space of aircraft plants, doubling the area of aircraft engine factories, multiplying the present number of employes by three, and operating all plants on a full-shift basis, the aircraft industry of the United States can produce the 50,000 military planes President Roosevelt yesterday told Congress he hoped the nation could be geared to produce in a year, Colonel John H. Jouett, president of the Aeronautical Chamber of Commerce of America, stated last night.

"Fortunately, the entire industry is in the best possible position to undertake the expansion in an orderly manner," Colonel Jouett said. "Of our forty-five airplane plants, twenty-three are working on military orders. The rearmament program started last year, and quantity orders from the Allies during the last several months have developed our production capacity, and so changed manufacturing technique, that further expansion is relatively simple. In other words, we have had nearly a year's experience in expanding production." production."

Colonel Jouett said he could foresee no serious bottlenecks in materials, tools or employes to retard production.

"The bottlenecks that threatened increased production several months ago no longer exist," he continued. "The numerous related industries which must be depended upon to supply tools and materials have so arranged their facilities that there appears to be no danger of bottlenecks in any of the lines purveying to our manufacturers.

"The industry now has about 100,000 employes in the plane, engine and accessories plants. It has spent considerable money training new employes, and does not anticipate any great difficulty in securing all necessary labor over the period needed for expansion."

Procurement methods under a 50,000 plane output program would differ somewhat for those of normal times, however, Colonel Jouett asserted.

"It should be realized," he said, "that normal peacetime procedure in government procurement of aircraft equipment must be somewhat modified in order to speed up production. Certain departmental interpretations of existing laws probably will have to be changed in order to develop the subcontracting system to the fullest possible extent."

In aviation circles it was pointed out that all aircraft factories not now filling military orders for our own or foreign governments would probably take on a great deal of the subcontract work. It was also pointed out that in the production of so large a number of planes it was likely that greater speed would be attained than ever before. Plants would "tool-up" for a certain model of a plane and would then go into assembly-line production on it. This would mean a simplification of operations and long periods of output without changing dies or jigs.

Manufacturers Held Ready

Special to THE NEW YORK TIMES.

BURBANK, Calif., May 16—"If President Roosevelt wants to open the throttle for a 50,000-plane take-off, the American airplane industry is ready to go right now," Robert E. Gross, president of California's Lockheed Aircraft Corporation, said tonight.

"With the best supplies of raw materials in the world, with the greatest machine tool industry in existence, the job can be done if the industry gets the chance and the signal to go."

By The United Press.

SANTA MONICA, Calif, May 16—Donald W. Douglas, president of Douglas Aircraft expressed the belief today that American aircraft builders could meet President Roosevelt's demand for 50,000 war planes a year.

"I know the American aircraft manufacturers, functioning under a free democratic system in the American way and unhampered by politics and partisanship, can and will help the President and Congress meet the challenge to everything this nation holds dear," he said.

SAN DIEGO, Calif., May 16 (UP)—Production facilities of existing aircraft plants must be greatly enlarged if President Roosevelt's demand for 50,000 fighting planes is to be filled, Major Reuben H. Fleet, president of Consolidated Aircraft, said today.

"We must know ahead of time what orders might be expected in order to produce in any such emergency," he explained.

Consair Increasing Present Area 87% at Lindbergh Field

The building expansion now under way at Consolidated Aircraft Corp.'s plant, San Diego, Cal., will aggregate approximately 396,000 sq. ft., or an increase in the present area of 87%, company has announced. Largest single area to be roofed is the new final assembly building measuring 360 by 720 ft.

Prior to the expansion, Consair had under lease 24.7 acres on which the factory buildings are located, and an additional 7.6 acres under option. New leases and options now cover an area of 64 acres. This area is all located on Lindbergh Field.

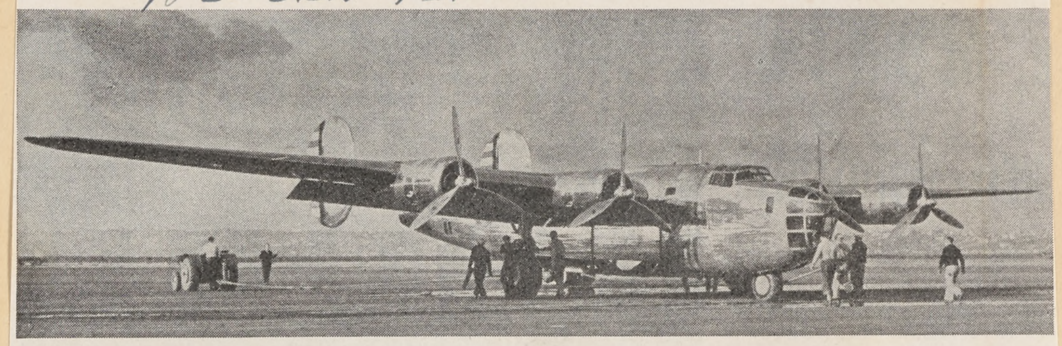
WESTERN FLYING MARCH 1940



First officially released photograph of the Consolidated B-24 four-engined bomber built for the U. S. Army Air Corps. Note that the huge ship incorporates the new Davis "mystery" wing and tricycle landing gear.

DETAILS ON NEW CONSOLIDATED BOMBER RELEASED BY AIR CORPS

THE **U. S. Army Air Corps'** new bombardment airplane, technically known as the XB-24, recently made test flights at Lindbergh Field, San Diego, California.

Built by the **Consolidated Aircraft Corp.,** it is a four-motored bomber of high wing, all-metal construction. The wing is a full cantilever type of high aspect ratio with four tractor engine nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard of ailerons.

Power is furnished by four Pratt & Whitney 18-cylinder twin-row radial air-cooled engines rated at 1200 h.p. each. The propellers are Hamilton Standard three-bladed hydromatic constant speed types, 12 ft. in diameter.

The approximate gross weight of the airplane is 40,000 lb.; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric-covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back, and bottom. The landing gear is of tricycle type with single wheel forward. This retracts into the fuselage. The rear or main landing wheels retract into wing wells.

This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately four tons.

Consair Acquires Hall

Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp. at San Diego, Cal., on Sept. 3 dedicated a new $2,500,000 addition to the company's plant and said that announcement of "vast future expansion was being withheld because of a Senate bill authorizing conscription of industry."

Maj. Fleet later announced acquisition by purchase of Hall-Aluminum Aircraft Corp. The latter company vacated its Bristol, Pa., site several weeks ago. There have been reports that Consolidated would build a plant at Dallas, Tex., using the Hall name, and it is believed Maj. Fleet's statement on Sept. 3 had reference to this proposal.

The new Consolidated facilities consist of a three-story building having dimensions of 260 by 720 ft.

Company has been contemplating further extensions at San Diego which would involve a cost of $800,000.

Consair's backlog is in excess of $120,000,000 and its record total of employes now stands at 9,485.

March 1940

CONSAIR STARTS EXPANSION WORK

CONSOLIDATED Aircraft Corp., San Diego, has embarked upon a factory expansion program which will increase the present area of the plant by 87 per cent at a cost of more than $2,000,000.

Seven new steel frame buildings will be erected at an expense of $1,200,000 and in excess of $800,000 will be expended for new production equipment. Bids have already been called for the construction work. By late 1940 Consolidated's factory will embrace 1,500,000 square feet and employ at least 7000 men on Army and Navy contracts which form the bulk of Consair's $43,000,000 backlog.

The original factory buildings are less than five years old. The large experimental building, the photo, physical and chemical laboratory, paint storage and tool buildings are just over three years old. Prior to the expansion program Consolidated had 24.7 acres of land on **Lindbergh Field** under lease and 7.6 acres under option. New leases and options now cover an area of 64 acres.

In addition to new buildings, all factory yard areas will be paved and used for outdoor assembly and maintenance areas.

Orders for which the plant is being enlarged are the Navy contract of $20,016,699 for long range patrol bombers and the Army Air Corps contract of $11,365,000 for a fleet of the new B-24 bombers.

50,000 Planes Possible in Year, Says Aeronautical Chamber Head

Colonel Jouett Asserts Plants Are Geared for Expansion, With 100,000 Workers and Related Industries Ready

By tripling the floor space of aircraft plants, doubling the area of aircraft engine factories, multiplying the present number of employes by three, and operating all plants on a full-shift basis, the aircraft industry of the United States can produce the 50,000 military planes President Roosevelt yesterday told Congress he hoped the nation could be geared to produce in a year, Colonel John H. Jouett, president of the Aeronautical Chamber of Commerce of America, stated last night.

"Fortunately, the entire industry is in the best possible position to undertake the expansion in an orderly manner," Colonel Jouett said. "Of our forty-five airplane plants, twenty-three are working on military orders. The rearmament program started last year, and quantity orders from the Allies during the last several months have developed our production capacity, and so changed manufacturing technique, that further expansion is relatively simple. In other words, we have had nearly a year's experience in expanding production." production."

Colonel Jouett said he could foresee no serious bottlenecks in materials, tools or employes to retard production.

"The bottlenecks that threatened increased production several months ago no longer exist," he continued. "The numerous related industries which must be depended upon to supply tools and materials have so arranged their facilities that there appears to be no danger of bottlenecks in any of the lines purveying to our manufacturers.

"The industry now has about 100,000 employes in the plane, engine and accessories plants. It has spent considerable money training new employes, and does not anticipate any great difficulty in securing all necessary labor over the period needed for expansion."

AERONAUTICS

AMPHIBIAN: *Land and Ocean Abilities Extend Ship's Range*

Equipped to rise from or alight on either land or water, Consolidated Aircraft Corporation's recent contribution to aeronautical progress, U. S. Navy plane XPBY-5A, is rated largest amphibian plane in the world.

The ship is a twin-engined flying boat to which has been added the amphibian feature, so that it can operate from land or sea, to land or water bases in remote localities, thus opening wider fields of utility.

Landing gear is tricycle type, single wheel forward and two aft, all fully retractable. Side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. Nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches, so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive.

Flight testing with the gear in all positions and in combination with the retractable wing tip floats failed to disclose any adverse effects. Advantages of the landing gear, aside from greatly extending the scope of utility, are many: for rough water taxiing, the extended gear serves as a sea anchor, greatly assisting in control in open water, and in making an approach for mooring or ramp in an adverse wind. Also, more engine power may be applied for short turns without undue acceleration. Turns on the water are achieved with far less skidding and the danger of scraping the keel on the ramp is eliminated.

There is no need for a beaching crew, because the ship can climb a ramp or beach under its own power, descending in like manner, completely controlled by brakes. Side wheels are above water when the ship rises on the step, in making a take-off, and automatic means have been provided to eject all water in the closed bow-wheel hatch before the plane is in the air, so that flying trim is unaffected.

U.S.
GUA
U.S. NAVY

". . . opening wider fields of utility . . ." *Official U. S. Navy photo.*

Contributing to smooth landings of the plane is its Goodyear multiple disc brake equipment.

FASTEST: *New Waco Commercial Rated Tops in Its Power Class*

Considered one of the fastest commercial ships in its power class, Waco's trim, new Model E has demonstrated its ability, since records show it has a maximum speed at sea level of 185 MPH., when powered with a Jacobs L-6 motor; 200 MPH. with Pratt & Whitney's SB Wasp Jr. and 204 with a Wright R 975 E-3 job.

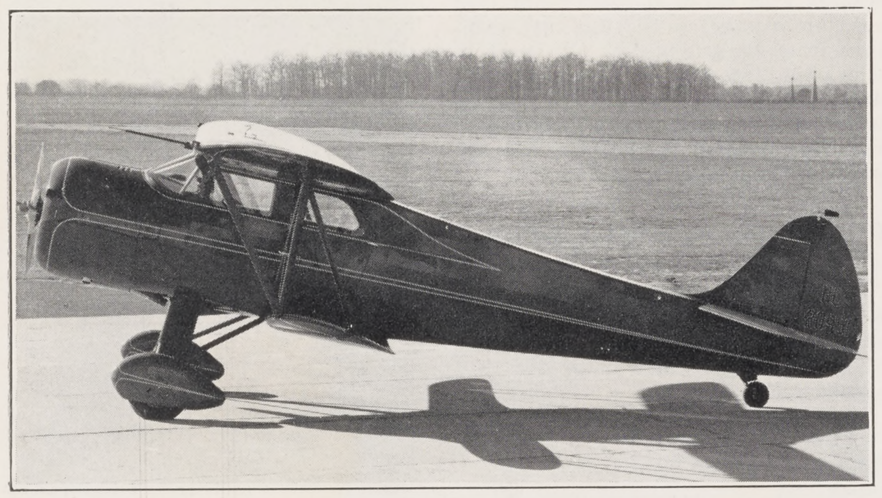
Optimum altitude cruising speed, points out Southern Flight, is 177 MPH. with the Jacobs; 195 with the Wasp and 200 with the Wright, while service ceiling with the three motors is 18,000, 23,500 and 24,000 feet, respectively.

New and interesting is the fact that the ship's wings are of plywood, latest development of Waco, chosen because of its declared higher degree of elasticity, plus non-warping factors. Engineers rate its ability high to absorb excessive gust loads without permanent set, plus a greater strength weight ratio. Wing lightness and ease of repairing are also points to be considered, technicians say.

Carrying capacity of the ship is four to five passengers and seating is well-balanced at no inconvenience to any occupant. Strong semblance to motor car type design is plainly evident, there is better visibility in a new, rounded windshield, and improved instrument panel places all dials and the radio directly in front of the pilot, with air temperature instruments located on the panel's right.

Engine refinements are a new type mounting termed "cushioned power," should reduce transmission of engine vibration to a minimum. Desired temperatures are maintained by means of a ventilator, controllable in flight.

Included in the standard equipment of the new Waco are: electric starter, generator, navigation lights, retractable landing lights, hydraulic brakes and parking brakes. Tires and tubes, Goodyear intermediate type, hydraulic brakes and tail wheel equipment, Goodyear.



". . . capacity of the ship, four to five . . ."

RANDOM

PHILOSOPHICAL: Tacked on the walls of the salesroom of The Newsome-Gibson Co., Goodyear flooring dealers in far-off Lubbock, Texas, is the following quotation from John Ruskin, which expresses a lot of truth, whether applied to flooring, tires or anything else the public buys.

"When you buy for price, these days, you can never be sure.

"It's unwise to pay too much, but it's worse to pay too little.

"When you pay too much, you lose a little money, that is all.

"But when you pay too little, you sometimes lose everything, because the thing that you bought was incapable of doing the thing it was bought to do.

"The common law of business balance prohibits paying a little and getting a lot. It can't be done.

"If you deal with the lowest bidder, it is well to add something for the risk you run. And if you do that, you will have enough to pay for something better."

SUBLETTING DISCUSSED

Lockheed and Douglas, Anticipating Huge Orders, Confer on a 'Farm Out' Policy

Los Angeles, Apr. 4—In anticipation of huge orders (possibly as much as $200,000,000) from France and Britain for bombardment and pursuit aircraft, Douglas Aircraft Co. Inc. and Lockheed Aircraft Corp., it was learned, have been conferring with other west coast manufacturers regarding a "farm out" policy for the gigantic contracts.

To preclude added design work and save weeks in engineering, all manufacturing information and assistance would be exchanged. Should Douglas get the Allied order for as many as 850 twin-engined attack-bombers, Boeing and Consolidated are expected to receive a possible 25% apiece of the sublet contract. Lockheed, which may receive an order for as many as 1,200 P-38 twin-engined interceptor pursuit ships, has been discussing a similar policy with Vultee Aircraft Inc.

Aero Engineers To Meet Here

Aircraft engineers from all parts of the southland are expected to attend the Society of Automotive Engineers' meeting at the San Diego club Friday evening.

Walter Hite

Walter Hite, Timm Aircraft Co. chief engineer, will speak on "Plastics in Aircraft Construction."

K. M. Jackson, chief of Consolidated's structural test department, will talk on "New Materials in Aircraft and Their Testing."

Ellis W. Templin, general chairman for the southern California section, Society of Automotive Engineers, will preside. The meeting was arranged by I. M. Laddon, Consolidated Aircraft Corp. chief engineer.

4/12/40 Tribune.

CONSAIR IN LINE FOR BIG ALLIED ORDERS, N. Y. VIEW

With Consolidated Aircraft Corp.'s plant expansion well underway, rumor were current today the firm is likely to be favored with larger orders of allied patrol bombers. The firm, according to reports from New York, recently was named as one of eight major American aircraft companies which "would get the business" of the allies provided it was able to produce the planes.

Conferences with British and French missions in the east now are reported being held by I. M. Laddon, Consair vice president.

Doubling Backlog

The company's backlog of approximately $50,000,000 is expected to be doubled as a result of new orders, from foreign nations and the American government. Personnel at the plant, now approximately 5000, is being increased daily.

Largest new unit in the Consolidated plant expansion program will be a final assembly building, 360 by 720 feet, adjoining the plant to the north. An addition to the experimental building, at the south of the main plant, is nearing completion.

Union 4/17/40

Allies About to Sign U.S. Plane Orders

NEW YORK, April 16 (A.P.)—The New York Times says contracts for the first large-scale orders of American warplanes by England and France since the outbreak of the war probably will be signed before the end of the week.

The Anglo-French purchasing mission in this country, adds the newspaper, is expected to place immediate orders for about 4600 bombers, flying boats and pursuit planes which have been released for export by the federal government.

A spokesman for the mission was quoted that now that an agreement as to prices has been reached, the mission could open conferences with manufacturers to learn the number of planes it could expect to receive monthly.

The Times says the planes in which the mission has shown most interest are said to be bombers and combat trainers made by North American Aviation Co. of Inglewood, Calif.; an improved version of the Lockheed-Hudson bomber, built in Burbank, Calif.; the new Martin F-4, built in Baltimore; the Douglas DB-7 bomber built in Santa Monica, Calif.; long-range bombers and flying boats of the Consolidated Aircraft Corp., San Diego; and the Vought-Sikorsky dive bomber made in Bridgeport, Conn.

Navy Bombers In Patrol of Passage

Trib. 4/11/40

Navy patrol planes are maintaining close watch on ships passing through the Windward passage in the Carribean, and strict military regulations are in effect at the Panama canal, said Capt. F. H. Roberts, master of the American-Hawaiian freighter Ohioan, which sailed north from San Diego late yesterday after discharging cargo from the east coast here. Roberts said twin-motored bombers in the Carribean closely scrutinize the superstructure of ships going through the passage to see that no attempts are made to change the vessel's identity.

A perfect view of the annular eclipse of the sun was obtained by those aboard the Ohioan last Sunday, Roberts reported. He said skies were clear, and that as the sun began to be obscured the temperature dropped three degrees.

Union 4/19/40

Consair Signs Year's Contract With Union

Retroactive to April 15 and affecting 4000 employes and all other workers who may be added to the payroll on an hourly paid basis in next 12 months, a contract just has been signed between the Consolidated Aircraft Corp. and the International Association of Machinists, Aircraft lodge 1125.

C. L. Bentley, representing the grand lodge of the association, said the agreement provides for a 40-hour week, time-and-a-half and double time for overtime, vacation with pay for one week for one year's service or more.

DIFFERENTIALS FIXED

Bentley said the contract further provides for five-cent differentials for regular Saturday and Sunday employes as well as all night employes and a minimum five-cent differential for lead men over the highest rate paid the men they supervise. Placed in effect is the maintenance of rates of pay in departmental transfers, when the work is similar.

"The most important provision of the contract," Bentley said, "is the setting up of a wage board. This consists of three men representing Aircraft Lodge 1125 and three men representing the management. This board will review the wage rates of all hourly paid employes every four months so that adjustments in wages may be made to meet increased costs of living and in recognition of experience and skill acquired by employes, as well as to adjust any inequalities of rates now in effect."

FOR ONE YEAR

The agreement is for one year, and thereafter subject to 15-day written notice by either party. Participating in the negotiations were Maj. R. H. Fleet, Consolidated president, who was assisted by James L. Kelly and W. A. Clark; J. B. Waskey, L. A. Perry and W. R. Davis, representing Aircraft Lodge 1125, and Bentley, representing the grand lodge.

Consolidated will become one of the largest aircraft plants in the world with completion of the present expansion program. Officials say the present personnel will be expanded to 7000 by mid-June with possibility that additional thousands will be employed during the late summer and fall.

Union 4/[illegible]/40

Allies Contract For 1500 Planes

WASHINGTON, April 18 (A.P.)—Great Britain and France contracted tentatively today to purchase more than 1500 speedy American warplanes expected to cost at least $120,000,000.

Reports of large-scale buying were confirmed by Arthur B. Purvis, head of the Anglo-French purchasing mission, who said "huge quantities" were involved. Although he mentioned no figures, aviation experts in close touch with the negotiations said at least 1500 planes were covered by the tentative contracts.

FIRST OF 4600 ORDER

Described as probably the largest such purchases on record they are the first of a series of projected orders for some 4600 aircraft of the latest type developed for the U. S. army and navy.

The initial contracts were for Curtiss fighting planes and for Douglas attack bombers, which congress has been told were superior to any that have seen action thus far in the European war.

Purvis also said the Allies were about to sign contracts in New York for an unidentified third type.

The Allied chairman indicated after a conference at the treasury with Secretary Morgenthau that large orders for at least two other models were imminent. Aside from the Curtiss and Douglas, which he said were signed in New York, he mentioned a Lockheed P-38 two-motor pursuit plane, a Bell single motor P-49 pursuit craft and a Lockheed-Hudson light bomber as figuring in current negotiations.

FIRST DELIVERY IN FALL

The first contracts conformed to a revised policy by which the war and navy departments agreed to release their most advanced models for export sale and delay some of their own deliveries in return for various concessions by the foreign buyers.

Airmen estimated that deliveries of the first of the planes ordered could not be expected before fall. They thought it significant that hundreds of pursuit planes were ordered at the outset, since these are designed to cope with bombing raids.

Air News

Latest American Heavy Bomber

The latest type of heavy bomber for the United States Army Air Corps is shown in the fine photograph at the top of this page. This machine has been built by the Consolidated Aircraft Corporation, of California, U.S.A., and recently made its first flight at Lindbergh Field, San Diego.

It is technically known as the XB-24, and is a high wing all-metal monoplane with a span of 110 ft. and a length of 64 ft. The stressed skin fuselage has hatches and windows in the nose, tail, back and bottom. Tricycle landing gear is fitted, with a single wheel forward that retracts into the fuselage, and two rear or main wheels that withdraw into wells in the wings.

Each of the four Pratt and Whitney 1,200 h.p. air cooled engines drives a constant-speed airscrew 12 ft. in diameter. The calculated top speed of this formidable bomber is over 300 m.p.h., and sufficient fuel will be carried to give a range of about 3,000 miles. The maximum bomb load will be about three tons. A crew of six to nine men will be carried, depending upon the mission to be performed.

American Rivalry on Transatlantic Air Routes

American Export Airlines have ordered three triple-engined Sikorsky flying boats for their proposed transatlantic air service. Each boat will be equipped to carry 16 passengers and a crew of 11. The company recently applied to the Civil Aeronautics Authority for licenses to operate air services between the United States and Marseilles by both the northern route, which is by way of Botwood, Newfoundland, and Foynes, in Eire, and by the southern one, via the Azores, Lisbon and Biscarosse. Permission for a service to Rome by way of Lisbon and Barcelona also was asked for. Last year the company carried out a series of transatlantic survey flights with a Consolidated 28 flying boat bought for the purpose.

At present Pan American Airways are the only company licensed by the C.A.A. to operate American transatlantic air services. They are reported to be planning to make their service to Lisbon a daily one within a few months.

Truly "Empire"

Almost every R.A.F. flying boat that goes on ocean patrol is an "Empire" boat in the fullest sense of the word. These large aircraft are the military counterparts of the Empire flying boats of civil aviation, and their pilots and crews come from all parts of the Empire.

The captain of one flying boat wears the dark blue uniform of the Royal Australian Air Force, and his second pilot is a New Zealander. The crew includes Englishmen, Scots and Welshmen and one other Australian. In another flying boat the captain is an Englishman, who flies with Scots, Welsh, and Canadians; a third "Sunderland" has a Canadian captain, and his companions are Welsh and English.

The veteran of one Squadron is a South African, who as second pilot has a young Yorkshireman from Doncaster. Another member of the crew, a fitter, comes of a prominent Yorkshire family from whose grounds the young Doncaster officer says he was often chased as a boy.

At one time it was hoped to get all-English, all-Scots, Irish, Welsh, or Canadian flying boats, but the reshuffling caused by expansion has made this impossible. There are already all-Australian flying boats, and there will be more all-Dominion boats when pilots and crews begin to arrive under the Empire training scheme.

Death of a Fine Imperial Airways Pilot

Capt. Frederick Dismore, of Imperial Airways, who died suddenly at Bristol on 17th February last, was justly proud of the fact that although he had flown well over a million miles he had never lost the life of a single passenger. He held a pilot's certificate for 27 years. During the last war he served in the R.F.C. and R.A.F. Afterward he was a pilot for three years with Handley Page Transport, one of the four pioneer air transport firms out of which Imperial Airways was formed in 1924.

Capt. Dismore was the first Imperial Airways pilot to complete 1,000,000 miles of flying, and by the time he celebrated his silver jubilee as a pilot, in August 1938, he had flown 1,250,000 miles in 11,600 flying hours, and had flown across the English Channel at least 4,600 times.

Britannia Trophy Award

The Britannia Trophy is awarded annually by the Royal Aero Club for what is considered to be the "most meritorious performance in the air during the year." The Club announced recently that the Trophy in respect of 1939 has been awarded to Mr. Alex. Henshaw for his record London–Capetown–London flight made in February of that year. On that occasion Henshaw took off from Gravesend aerodrome in his Percival "Gull" light monoplane, and 39 hr. 25 min. later he landed at Wingfield aerodrome, Capetown, having flown non-stop at an average speed of 152 m.p.h. The return flight was almost as good, and was accomplished in 39 hr. 36 min., at an average speed of 151 m.p.h.

Henshaw's success was a triple one, as in addition to setting up new records for solo flights in each direction, he surpassed by 30½ hr. the record for a "there and back" flight set up by Flying Officer A. E. Clouston and Mrs. Kirby-Green on the 14th-20th November 1937. Flying Officer Clouston used his D.H. "Comet" monoplane.

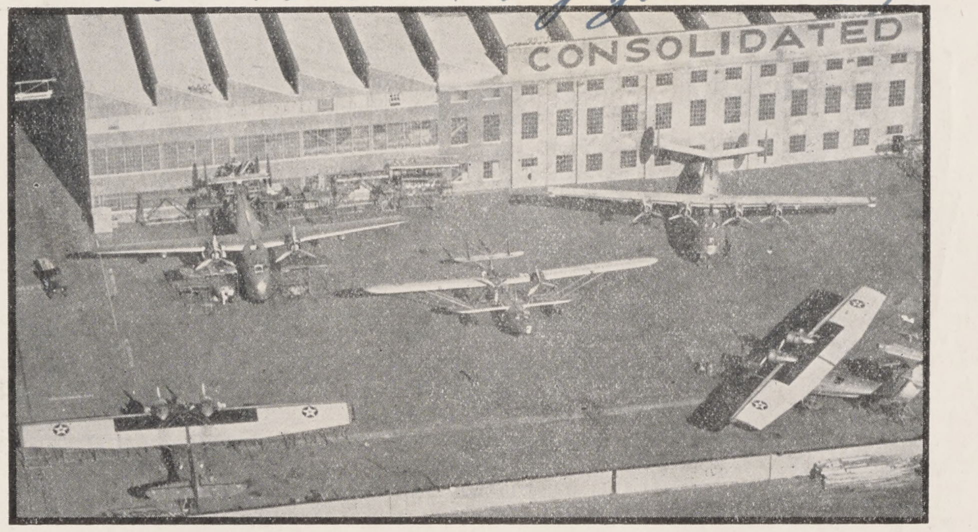
End of the Airship *"Los Angeles"*

The United States airship *"Los Angeles"* is being dismantled, and the metal from her will be sold as scrap. The *"Los Angeles"* was built at Friedrichshafen, Germany, under the designation "Z.R.3," and was flown from there across the North Atlantic to Lakehurst, New Jersey, on 12th–15th October 1924, accomplishing the 5,066 miles flight in 81 hr. 17 min. On this delivery flight she was commanded by Dr. Hugo Eckener, of Zeppelin fame. As a unit of the United States Airship Service the *"Los Angeles"* made about 240 successful flights during her career, and hundreds of officers and men of the United States Army Air Corps were trained in her.

South African Gliding Record

A new soaring height record for South Africa was achieved recently by Mr. G. Dommisse, of Pretoria. He took off from the Rand Airport, Germiston, and reached a height of 12,000 ft. during a flight that lasted 7 hr. 20 min. The only instruments fitted in his glider were an airspeed indicator and a bubble level.

The U-S Fleet Magazine (S.D.)



In the photo above taken of the plant yard of the Consolidated Aircraft Corp. you will notice at the upper left, the Model 31, Consolidated's latest boat and the plane that boasts the two most powerful radial air-cooled engines ever to be installed in an aircraft. To the upper right is the U. S. Navy's four-engined XPB2Y-1, the plane which has hopped across the continent and back covering the entire distance over land and without benefit of gear for descent upon land. In the center is one of the old timers, a Consolidated P2Y, one of the type which, in a formation of six planes, made the first massed flight from San Francisco to Honolulu (2,414 miles—Jan., 1934). At the bottom, left is a PBY being fitted for special work and to the right the world's largest Amphibian, the XPBY-5A, recently flown to Washington.

LATE CONSAIR BOMBERS RELEASED FOR POSSIBLE SALES TO ALLIES

Union 7/18/40

Two of Consolidated Aircraft Corp.'s latest and most powerful long-range patrol bombers, the army's XB-24 and the navy's XPB2Y-1, have been released for negotiation for possible purchase by the Anglo-French purchasing commission, according to word received here yesterday from Washington.

Unofficial advices are to the effect Great Britain and France may award a joint contract to Consolidated for what army and navy authorities agree are two of the fastest, longest range and heaviest armament-carrying planes constructed in this country.

The XB-24 recently completed its acceptance trial flights. Of 24 tons, the huge craft is of high wing, all-metal construction, 64 feet long, 110 feet wing spread and equipped with four 1200-horsepower Pratt-Whitney engines. It has a speed in excess of 300 miles an hour and can cruise 3000 miles carrying four tons of bombs. It carries a crew of nine in wartime.

The navy has released virtually no details of the construction features of the XPB2Y-1. It is a 4-motored all-metal bomber, heavily armed, and weighs when fully loaded with bombs, about 24 tons. Equipped for high altitude flying, it is reported to have a cruising range of 4500 miles.

For a brief period the plane was the aerial flagship of Rear Adm. Arthur B. Cook, scouting force aircraft commander. Recently it has been based at the Naval air station for the training of pilots to handle the 4-motored planes which soon will supplant the present two-motored PBY-type patrol bombers.

Flight 9-5-40

On With the Job

On Aug. 21 five companies, Douglas, Lockheed, Boeing, Vultee and Consolidated, announced in a joint statement that they were going ahead with preparations to increase their production without waiting to know what legislation Congress would pass to reduce their profits. The Companies stated that on their own responsibility members of the U.S. Aircraft Industry had bought materials worth more than £20,000,000, and added 21,000 employees to their pay rolls, and made contracts for additional plant and equipment valued at more than £10,000,000.

Reports have been current for some time that the production of aero-motors was still behind airframe production. The real "bottle-neck" is with the new Allison motors. Only 65 Allison motors were built in July, but by November this rate should be increased to about 400 a month. The Pratt and Whitney Division of the United Aircraft Corporation expects to produce between 700 and 800 motors a month in the near future. The Curtiss Wright Corporation is understood to have reached a rate of about 600 motors a month.

Flight 9-5-40

R.A.A.F. Buys Consolidateds

AUSTRALIA has ordered seven Consolidated PBY-5 amphibians for use by the Royal Australian Air Force. This nosewheel flying boat, known in its civil version without wheels as the Model 28, was described in *Flight* for February 8, page 114h, and its suitability to patrol work on the Australian coastline was pointed out. The Model 28 is powered by two Pratt and Whitney R-1830-S1C3G, rated at 1,050 h.p. at 2,550 r.p.m at 7,800ft. Take-off rating is 1,200 h.p. at 2,700 r.p.m. Maximum speed is given as 199 m.p.h. at 7,800ft.

Center is a P2Y, one of the first Navy long range patrol boats. Lower left is the Navy's XPBY-5A amphibian, and lower right is the XPB2Y-1 four-engined flying boat, first U. S. Navy flagplane. Camera plane was the Consolidated Fleetster utility ship.

Richard Archbold's Unique Achievement

RICHARD ARCHBOLD, in his Consolidated Model 28 flying boat (U. S. Navy designation PBY patrol bomber), completed nearly two years' work in eleven months when he terminated his expedition in Netherlands New Guinea, last May, and flew his *Guba* to Sydney, Australia, en route home. On his homeward voyage, Mr. Archbold established a number of new records with the GUBA:

1. It was the first time an airplane has flown around the world at its greatest diameter.
2. The longest flying boat over-ocean non-stop flight—Daker to St. Thomas, Virgin Islands—3,300 miles.
3. The first time a flying boat has flown around the world.
4. The first time an airplane has crossed the Indian Ocean from Australia to Africa.
5. The first time a flying boat has flown across Africa.
6. The first time a flying boat has flown across Australia.

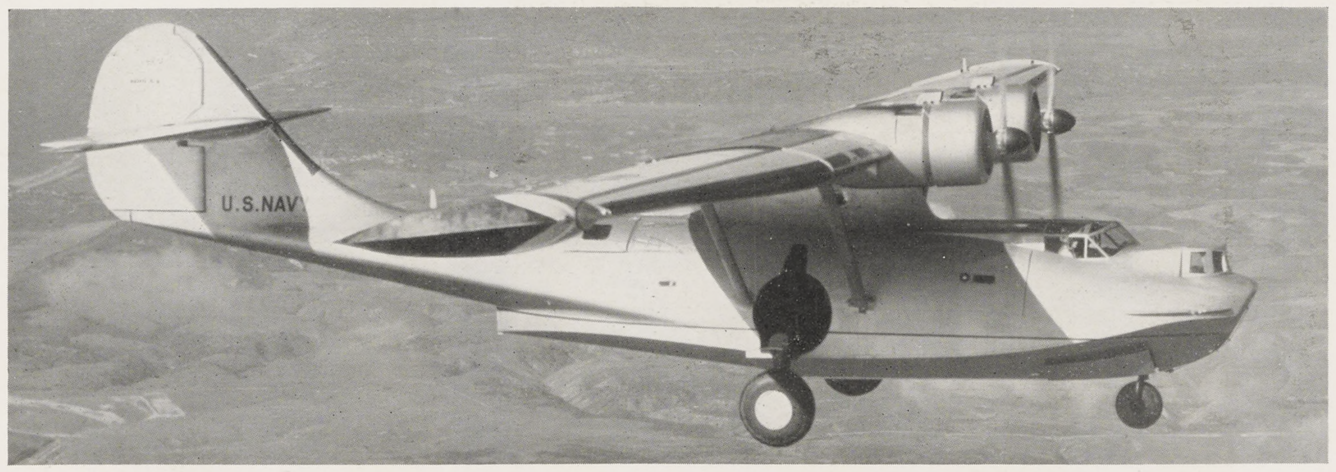
INTAVIA WORLD MARCH '40.

New Aircraft

THE CONSOLIDATED MODEL 28-5A



The Consolidated Model 28-5A twin-engined Amphibian with wheels lowered.

THE Consolidated Aircraft Corpn. has delivered to the U.S. Navy an amphibious version of the well-known Model 28 (Naval PBY Series) flying-boat which is designated the Model 28–5A (XPBY-5A).

The landing gear is of the tricycle type with the main wheels retracting into wells in the sides of the hull and the nose wheel into a compartment in the bow, which is closed by automatically-operated hatches. All three wheels are operated by a central hydraulic drive, the power being derived from the main power-plant or from an auxiliary engine. Emergency hand gear is also provided.

There is no need for a beaching crew as the Model 28–5A can climb a ramp or beach under its own power and can descend in the same manner completely controlled by its brakes.

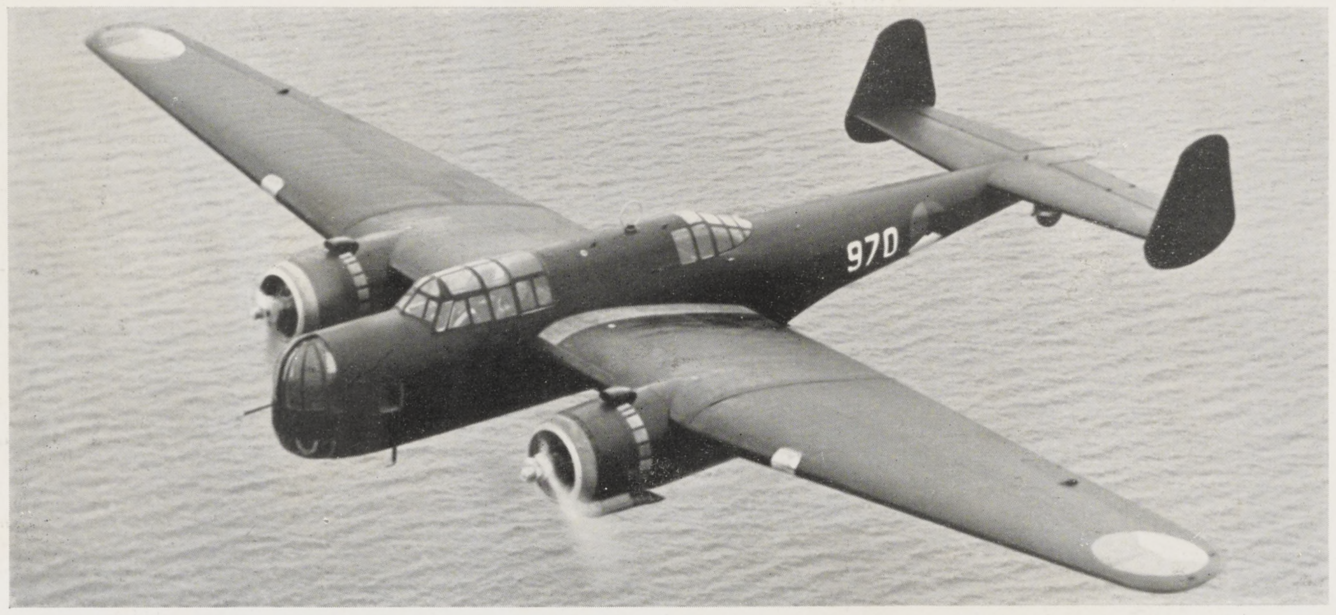
No special technique is needed for either take-off or return to land or water. The side wheels are above water when the machine rises on its step to take-off and water is automatically ejected from the bow wheel hatch before it is in the air, so that flying trim is not affected. When running up the engine on land the wheels may be locked, elevators pulled hard back and both engines given full take-off throttle without any possibility of the nose wheel rising from the ground. When landing the brakes may be put hard on without any adverse effect. In a side-wind landing the tendency is to straighten out.

THE FOKKER T.9

The illustration below shows the Fokker T.9 twin-engined Bomber monoplane which has been specially developed by the N.V. Fliegtuigenfabriek Fokker for the East Indies Army Air Service.

Unlike the majority of its predecessors the T.9 is of all-metal construction with a stressed-skin covering to wings and fuselage. It conforms to modern practice by being a mid-wing cantilever monoplane, with retractable undercarriage and a twin-ruddered tailplane.

The T.9 is fitted with two Bristol "Hercules" fourteen-cylinder double-row radial sleeve-valve engines. No details of performance are available.



The Fokker T.9 monoplane (two Bristol "Hercules" engines) built for the Netherlands East Indies Army Air Service

Consair Needs More Specialists As Plane Production Stepped Up

Union 4/22/40

Although they are not making a nation-wide appeal for experienced men whose training enables them to orient themselves to plane designing quickly, Consolidated Aircraft Corp. officials announced yesterday they are seeking such workers in every part of the country, particularly in universities and colleges.

Steadily mounting orders from American and foreign governments make such a step imperative to keep pace with production, company officials said.

Especially needed are men with training as stress and armament engineers, specification experts, power plant, electrical, wing, fuselage and under-carriage engineers, research, hydraulics and design engineers, checkers and lay-out draftsmen.

The five major aircraft manufacturers in southern California have construction backlogs of $218,651,525, with an anticipated $200,000,000 or more from the Allied purchasing mission. Consolidated backlog totals $50,000,000, which probably will be doubled before midsummer, officials said.

Los Angeles plants are seeking experienced men, United Press reported. The total number of men employed in the southland in plane manufacture is 29,381, of which more than 5000 are employed in San Diego's three plants, Consolidated, Ryan and Solar.

Four Consolidated officials are in Washington and New York consulting with war and navy department authorities and the Anglo-French purchasing mission. They are Maj. Reuben H. Fleet, president; I. M. Laddon, chief engineer; C. A. Van Dusen, works manager, and Edgar Gott, publicity manager.

Trib. 4/23/40

ORGANIZE CLUB OF ORIGINAL AIRMAIL VETS

Organization of the "Last Man Pioneer Air Mail club" has been effected in Chicago bv 20 pioneers, former civilian employes of the postoffice department, who served in all branches of the service, according to word received by Edward D. Havens, La Mesa, one of the original air mail mechanics.

Havens, now supervisor in the assembly and test department of the A. and R. division, naval air station, resides at 7921 Lemon circle, La Mesa. Anyone who was in the air mail service from 1918 to 1927, when it was under the postoffice department, is asked to contact him in order to get on the mailing list as a member of the club.

The organization will have no offices and no dues. It is estimated that some 600 airmail veterans are eligible for membership. The executive committee includes Jack Knight, educational director of United Air Lines; Capt. Benjamin B. Lipsner superintendent of the first U.S. airmail service; Edward Nelson, acting secretary, and others. Maj. R. W. Schroeder, former holder of the world's altitude record, is a member of the advisory committee.

Among airmail pioneers in San Diego are Maj. Reuben H. Fleet, president of Consolidated Aircraft Corp., who was officer in charge of airmail when it was first inaugurated in May, 1918, between Washington, D. C., and New York, and Otto Praeger, who supervised the start of airmail service for the postoffice department.

Trib 4/23/40

Trained Men Sought By Consolidated

With other large aircraft companies in southern California, Consolidated Aircraft Corp. is seeking experienced, trained men, according to report by Consair officials. They said that especially needed are men with training as stress and armament engineers, specification experts, power plant, electrical, wing, fuselage and under-carriage engineers, research, hydraulics and design engineers, and checkers and lay-out draftsmen.

The five major aircraft manufacturing companies in southern California have construction backlogs of $218,651,525, with an anticipated $200,000,000 or more from the allied purchasing mission. Of this total, the Consolidated backlog is $50,000,000.

Union April 26/40

Allies Consider Buying New Consair Bombers

Confirming announcement made here last week, the army air corps yesterday authorized the sale to foreign powers of Consolidated Aircraft Corp.'s new four-motored long-range bomber, the United Press reported from Washington.

The Anglo-French purchasing mission is reported to be considering purchase of 50 or more of the powerful bombers which have a flight range in excess of 3000 miles carrying four tons of bombs.

Union 4/22/40

Shortage Reported Of Aero Engineers

LOS ANGELES, April 21 (A.P.)—Jobs are open here for aeronautical engineers.

"We have 790 engineers on the payroll and we must raise that figue to 900 by July 1," Hall L. Hibbard, chief engineer for the Lockheed Aircraft Corp., said today. He indicated a similar situation exists at other factories in this area.

Hibbard insisted that this is not due altogether to war orders, pointing out that Harold J. Geder, engineer, for instance, is working on a design for a 32-passenger plane that may fly tail-first in 1945.

He said the great need is for stress and armament engineers; specification experts; power plant, electrical, wing, fuselage and under-carriage engineers; research, hydraulics and design engineers; checkers and layout draftsmen.

Trib 4/25/40

Navy Contract Won By Consair Plant

The Consolidated Aircraft Corp. has been awarded a $26,221 contract for spare parts for planes by the navy department, The Associated Press reported from Washington, D. C.

Trib 4/25/40

Approve Sale To Allies of S.D. Bombers

Army authorization of the sale to foreign powers of Consolidated Aircraft Corp.'s new four-motored bomber was announced today at Washington, D. C., where the allied purchasing mission said it contracted for the purchase of $200,000,000 worth of American airplanes.

Consolidated authorities said they had as yet received no word of the authorization and that any allied purchases of the plane probably would not be made known until Consair has been notified officially of the release.

The allies are considering purchase of 50 or 60 Consair B-24 bombers, the United Press reports from Washington, D. C.

Arthur B. Purvis, British, and Rene Pleven, French representative of the mission, told reporters that these contracts included large quantities of Bell pursuit planes, Curtiss pursuit planes, Douglas bombers and Allison, Wright and Pratt-Whitney motors.

O.K. All Purchases

Purvis added that the United States had now released for allied purchase all of the late type military aircraft which the allies had sought permission to buy, The Associated Press reported.

He declined to give the individual number or cost of different types of planes or engines because the information might interfere with pending negotiations for additional military equipment. Several months ago, the mission said it was embarking on a potential $1,000,000,000 worth of buying in this country.

Release of late-type American planes previously asked by the allies was completed a few days ago, said Purvis, when the army authorized the sale of the Consair bombers.

Cost of the engines to be purchased, the allied representatives continued, included cost of building the factories in which they will be produced. Purvis and Pleven said the allies were building factories for American manufacturers for all additional orders of engines.

Purvis, Pleven and Capt. Harry E. Collins, chairman of the president's committee to coordinate foreign and domestic airplane purchasing, called on Treasury Secy. Morgenthau today to review developments to date. Morgenthau is the president's contact man with the committee.

Trib 4/29/40.

Towers and Aid Due For Navy Air Tour

Rear Adm. John H. Towers, chief of the navy bureau of aeronautics, and Capt. Alfred E. Montgomery, an aid, will inspect San Diego navy and commercial aviation activities this week, according to word received today from Washington, D. C., by Rear Adm. J. R. Defrees, 11th naval district commandant.

The officers tentatively are due here by navy plane Friday afternoon and will remain until Monday or Tuesday of next week. In addition to inspecting the navy's flying forces and aviation shore facilities here, they plan to visit Consolidated Aircraft Corp., where large numbers of navy bombers are under construction. Both Towers and Montgomery have been on duty in San Diego in the past.

Union 4/26/40

Plane Orders Exceed 4000

WASHINGTON, April 25 (A.P.)—Great Britain and France have swelled their pending orders for American war planes to well beyond 4000, it was indicated today by an announcement that the Allies in the last two weeks have placed aircraft and engine contracts aggregating $200,000,000.

The announcement came from officials of the Allied purchasing mission who said large quantities of speedy Curtiss and Bell pursuit planes, Douglas bombers and engines of three types were included.

The latest purchases, it was estimated by airmen in touch with the negotiations, represent nearly 2000 planes and an undisclosed larger number of Allison, Wright and Pratt & Whitney motors.

NEWTYPE TO GET WAR TEST

Arthur B. Purvis, chairman of the mission, and Rene Pleven, French representative, said the cost of the engines included facilities to produce them. They explained that the Allies were financing factory expansions necessitated by the orders.

The announcement of the Bell contract promised a European war test for an unusual type of fighting plane, the P-39 developed for the army air corps. This plane mounts a small cannon in its nose and is powered by an engine placed in the center of the fuselage.

The Curtiss pursuit planes include both P-40 and P-46 models, released by the army in accord with the new policy by which the air corps expects to acquire more advanced models at no additional cost along with valuable technical information on the performance of American planes in combat.

CONSAIRS INCLUDED

The Douglas craft are fast two-motor bombers. They figured with the Curtiss planes in contracts disclosed previously.

The estimate that pending orders have been increased to more than 4000 was based on official figures showing that American plants on March 1 were working on 1363 military aircraft for Britain and 1371 for France.

Talking to reporters after conferring with Secy. Morgenthau at the treasury, Mr. Purvis said that the army had now released for export all the late type aircraft which the Allies had sought. The latest, he said, was the long-range B-24 Consolidated bomber.

NORTHROP TO MAKE CONSAIR PARTS

Western Flying.

NORTHROP AIRCRAFT, Inc., with the first unit of its new plant completed, will go into production on a $700,000 order for small assemblies for the Consolidated Aircraft Corporation. The parts will be manufactured during the interim before Northrop goes into production on its own airplane, for which the plant was erected.

Navy Aviation Head to Visit S. D. Friday

The navy's bureau of aeronautics will direct its official attention to San Diego's varied service and service-connected aviation activities this week, according to information received yesterday from Washington by Rear Adm. J. R. Defrees, commandant of the 11th Naval district and the local operating base.

Adm. Towers

Rear Adm. John H. Towers, chief of the bureau of aeronautics, according to a tentative schedule announced by the commandant, plans to arrive here from the capital by plane Friday afternoon and remain until next Monday or Tuesday. He will be accompanied by Capt. Alfred E. Montgomery, who is serving in the bureau of aeronautics.

In addition to inspections of the navy's flying forces and establishments here Adm. Towers is expected to devote time to study of the local commercial plane building plants. He is no stranger to San Diego, having served here in several important posts prior to his present duty.

Capt. Montgomery soon is to take command of the U.S.S. Ranger, local aircraft carrier basing temporarily on the Atlantic coast.

CONSAIR STARTS EXPANSION WORK

Western Flying

CONSOLIDATED Aircraft Corp., San Diego, has embarked upon a factory expansion program which will increase the present area of the plant by 87 per cent at a cost of more than $2,000,000.

Seven new steel frame buildings will be erected at an expense of $1,200,000 and in excess of $800,000 will be expended for new production equipment. Bids have already been called for the construction work. By late 1940 Consolidated's factory will embrace 1,500,000 square feet and employ at least 7000 men on Army and Navy contracts which form the bulk of Consair's $43,000,000 backlog.

The original factory buildings are less than five years old. The large experimental building, the photo, physical and chemical laboratory, paint storage and tool buildings are just over three years old. Prior to the expansion program Consolidated had 24.7 acres of land on **Lindbergh Field** under lease and 7.6 acres under option. New leases and options now cover an area of 64 acres.

In addition to new buildings, all factory yard areas will be paved and used for outdoor assembly and maintenance areas.

Orders for which the plant is being enlarged are the Navy contract of $20,016,699 for long range patrol bombers and the Army Air Corps contract of $11,365,000 for a fleet of the new B-24 bombers.

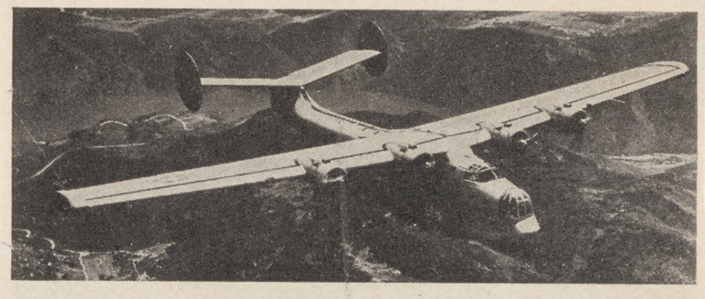
PBY-4 (U. S. Navy) Patrol Bomber

TYPE: 5-9- place, closed, flying boat, monoplane.
DIMENSIONS: Length, 65 ft. 1.75 in. Height, 17 ft. 11 in. Span, 104 ft.
AREAS: Wing (incl. ailerons), 1400 sq. ft.
WEIGHTS: Gross weight loaded, 27,413 lbs. Wing loading, 19.3 lbs. per sq. ft. Power loading, 11.4 lbs. per h.p.
POWER PLANT: 2 P&W Twin Wasps, geared. Engine limits, (maximum except takeoff) 1050 h.p. each at 7800 ft., 2550 r.p.m.
PERFORMANCE: Placard speeds: level flight (high speed), 199 m.p.h.; cruising speed, 179 m.p.h.; stalling speed (landing), 69 m.p.h. Climb at sea level, 920 ft. 1st min. Usable ceiling, 24,000 ft. Maximum range 4000 mi.
CONSTRUCTION: Wings, aluminum alloy, stressed skin, Z-bar stiffeners, fabric covered ailerons and trailing edges. Fuselage, monocoque, aluminum alloy construction, smooth skin, re-inforced with Z bars. Empennage, stressed skin, aluminum alloy, fabric covered movable surfaces.
STANDARD EQUIPMENT: Instruments, sensitive altimeters, engine pressure gauge units, carb. temp. gauges, manifold pres. gauge, clock, airspeed ind., thermocouples, oil temp. gauges, ammeters, direct gyro, Gyro horizon and pilot, elec. tach., fuel gauges. Trimming tabs on rudder and elevators. Other equipment, shock mounted instrument panels, batteries, fire extinguishers, flares, starters.
REMARKS: Other data restricted.

XPBY-5A (U. S. Navy) Amphibian Patrol Bomber

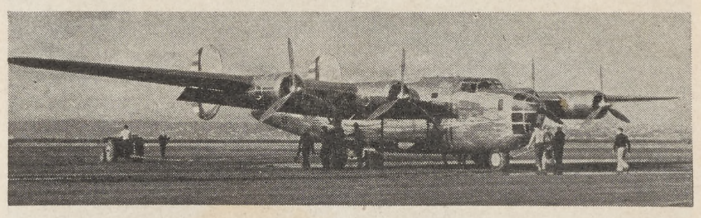
TYPE: 5-9 place, closed, amphibion, monoplane.
DIMENSIONS: Length, 65 ft. 1¾ in. Height, 19 ft. 9 in. Span, 104 ft.
AREAS: Wing (incl. ailerons) 1400 sq. ft.
WEIGHTS: Gross weight loaded, 27,413 normal lbs., 30,500 lbs. (provisional.) Wing loading, 19.6 lbs. per sq. ft. Power loading, 11.4 lbs per h.p.
POWER PLANT: 2 P&W R-1830-S1C3G. Engine limits, (maximum except takeoff) 1050 h.p. each at 2550 r.p.m. Maximum of 1200 h.p. each available for takeoff.
PERFORMANCE: Placard speeds: level flight (high speed), 199 m.p.h. at 7,800 ft.; cruising speed, 179 m.p.h. at 7,800 ft., stalling speed (landing), 69 m.p.h. Climb at sea level, 920 ft. 1st min. Service ceiling, 24,000 ft. Maximum range 4,000 mi.
REMARKS: Basically the Model 28 twin-engined flying boat, with addition of amphibion gear, suitably incorporated in the structure. Landing gear is of the tricycle type with a single wheel forward and two aft.

PB2Y-1 (U. S. Navy) Patrol Bomber



TYPE: Four engine, long range, flying boat, monoplane.
REMARKS: All data restricted.

XB-24 (U. S. Army) Heavy Bomber



TYPE: 6-9 place, closed, land, monoplane.
DIMENSIONS: Length, 64 ft. Height, 19 ft. Span, 110 ft.
WEIGHTS: Gross weight loaded, 40,000 lbs.
POWER PLANT: 4 P&W twin-row engines. Maximum of 1200 h.p. each available for takeoff.
PERFORMANCE: Placard speeds: level flight (high speed), more than 300 m.p.h. Maximum range approx. 3000 mi.
CONSTRUCTION: Wings, all metal, full cantilever. Fuselage, all metal. Empennage, all metal. Landing gear, tricycle, retractable.
STANDARD EQUIPMENT: Flight instruments, full complement. Engine instruments, full complement. Propellers, Hamilton Standard 3-blade hydromatic full-feathering. Wing flaps, Fowler type, inboard of ailerons. Trimming tabs on rudders and elevators, adjustable in flight.
REMARKS: Bomb carrying capacity approx. four tons. Other data restricted.

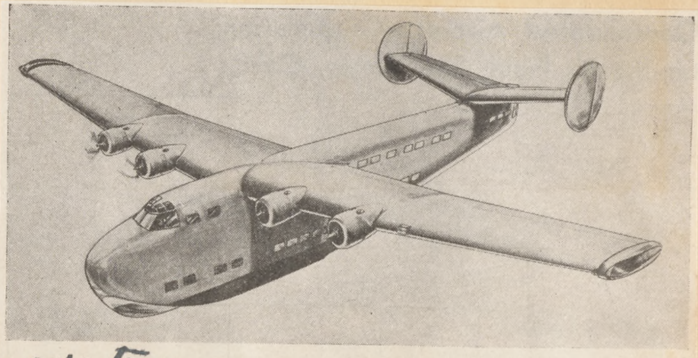
Model 28 Flying Boat (2 P. & W., 2400 h.p.)

TYPE: 12-24-place, closed, sea, monoplane.
DIMENSIONS: Length, 65 ft. 1.75 in. Height, 17 ft. 11 in. Span, 104 ft.
AREAS: Wing (incl. ailerons), 1400 sq. ft.
WEIGHTS: Gross weight loaded, 30,500 (provisional), 27,000 (normal). lbs. Wing loading, 19.3 lbs. per sq. ft. Power loading, 11.3 lbs. per h.p.
POWER PLANT: 2 P&W R1830-S1C3G. Engine limits (maximum except takeoff), 1050 h.p. each at 7500 ft., 2550 r.p.m. Maximum of 1200 h.p. (each) available for takeoff.
PERFORMANCE: Placard speeds: level flight (high speed), 199 m.p.h. at 7800 ft.; cruising speed, 179 m.p.h. at 7800 ft.; stalling speed (landing) without flaps, 69 m.p.h. Climb at sea level, 920 ft. 1st min. Usable ceiling, 24,000 ft. Maximum range, 4000 mi.
CONSTRUCTION: Wings, stressed skin aluminum alloy, smooth skin reinforced with Z-bar stiffeners. Fuselage, monocoque, aluminum alloy, smooth skin reinforced with Z-bar stiffeners. Empennage, stressed skin aluminum alloy, fabric covered movable surfaces.
STANDARD EQUIPMENT: Flight instruments, shock mounted instrument panel, sensitive altimeters, compass, directional gyro, gyro horizon, gyropilot, clock, airspeed indicator; engine instruments, pressure gauge units, carburetor temperature gauges, manifold pressure gauges electrical tachometers ammeters, oil temperature gauges, fuel gauges, thermocouples. Starter, electrical. Propeller, constant speed. Landing lights, radio, radio shielding. Trimming tabs on rudder and elevators adjustable in flight. Other equipment, batteries, fire extinguishers and flares.
REMARKS: Amphibion version also available.
NOTE: All data supplied by manufacturer; subject to revision upon certification.

Model 29 Flying Boat (4 P. & W., 4800 h.p.) Experimental

TYPE: 36 or 62-place, closed, sea, monoplane.
DIMENSIONS: Length, 79 ft. 3 in. Height, 25 ft. 4 in. Span, 115 ft.
AREAS: Wing (incl. ailerons), 1780 sq. ft.
WEIGHTS: Gross weight loaded, 65,000 lbs. Wing loading, 36.5 lbs. per sq. ft. Power loading, 13.5 lbs. per h.p.
POWER PLANT: 4 P&W R1830-S1C3G. Engine limits (maximum except takeoff), 1050 h.p. (each) at 7800 ft., 2550 r.p.m. Maximum of 1200 h.p. (each) available for take off.
PERFORMANCE: Placard speeds: level flight (high speed), 226 m.p.h. at 7800 ft; cruising speed, 210 m.p.h. at 75% power at 10,000 ft.; stalling speed (landing) without flaps, 70 m.p.h. Climb at sea level, 690 ft. 1st min. Service ceiling, 18,000 ft. Maximum range, 5200 mi.
CONSTRUCTION: Wings, cantilever, skin stressed, all metal. Fuselage, monocoque, aluminum alloy. Empennage, aluminum alloy, full cantilever.



Consolidated 29

Western Flying.

STANDARD EQUIPMENT: Flight instruments, full complement; engine instruments, full complement.

DETAILS ON NEW CONSOLIDATED BOMBER RELEASED BY AIR CORPS

THE U. S. Army Air Corps' new bombardment airplane, technically known as the XB-24, recently made test flights at Lindbergh Field, San Diego, California.

Built by the Consolidated Aircraft Corp., it is a four-motored bomber of high wing, all-metal construction. The wing is a full cantilever type of high aspect ratio with four tractor engine nacelles mounted flush to the upper surface of the center section. Fowler type flaps extend inboard of ailerons.

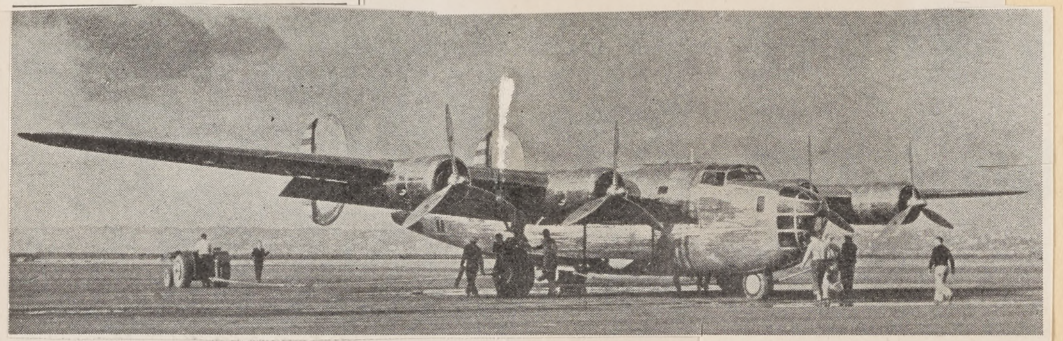
Power is furnished by four Pratt & Whitney 18-cylinder twin-row radial air-cooled engines rated at 1200 h.p. each. The propellers are Hamilton Standard three-bladed hydromatic constant speed types, 12 ft. in diameter.

The approximate gross weight of the airplane is 40,000 lb.; wing span, 110 ft.; length of fuselage, 64 ft.; and over-all height, 19 ft. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric-covered and fully counter-weighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back, and bottom. The landing gear is of tricycle type with single wheel forward. This retracts into the fuselage. The rear or main landing wheels retract into wing wells.

This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles, and a bomb carrying capacity of approximately four tons.

Consolidated Aircraft Corporation is test flying its new four-engined B-24 long range bomber utilizing the advanced **"Davis wing"** airfoil. The manufacturer holds a contract amounting to $11,365,000 for an undisclosed number of four-engined bombers. Western Flying.



First officially released photograph of the Consolidated B-24 four-engined bomber built for the U. S. Army Air Corps. Note that the huge ship incorporates the new Davis "mystery" wing and tricycle landing gear.

PAGE EIGHT-A THURSDAY MORNING, MAY 2, 1940

Tete-a-Tete .. with Eileen Jackson

Announcement is made by Mrs. William H. Koenig, Los Angeles, of the marriage today of her daughter, Madie Koenig, to Edgar N. Gott, San Diego, and Washington, D. C. The ceremony will take place at noon at the home of Col. and Mrs. John H. Jouett, 3524 Edmonds st., N. W., Washington, D. C., with about 30 persons attending.

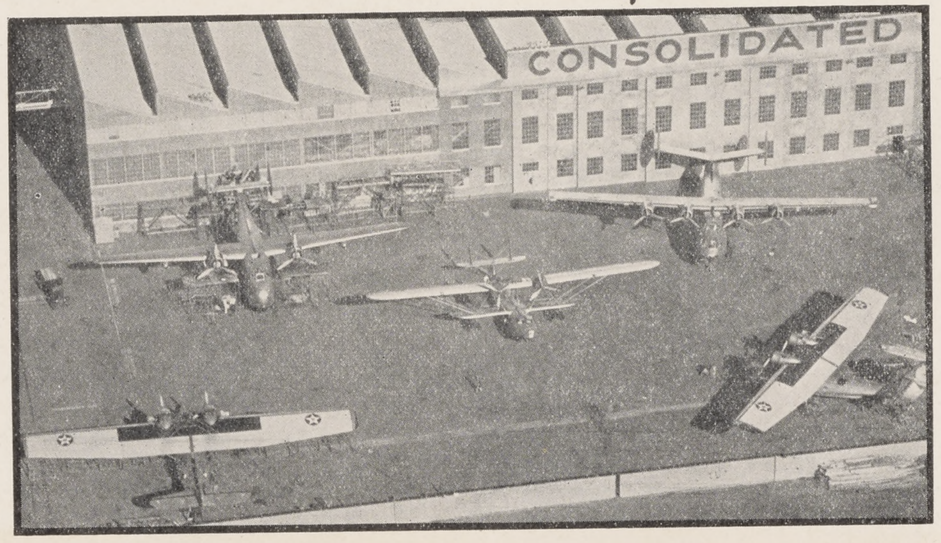
The bride was born in Omaha, Neb., and after attending schools in America and Dresden, Germany, graduated from Vassar college in 1922. Shortly thereafter Miss Kienig went to Vienna, which was her residence until 1938. She was president for eight years of the American Women's Club of Vienna and vice president of the Federation of American Women's Clubs Overseas. At present she is a member of the Ebell club and Assistance League of Los Angeles. She has lectured extensively on the west coast, telling her experiences in escaping from Vienna after Hitler's annexation of Austria and has just returned from an extensive tour of South America with her mother.

Maj. Gen. Henry H. Arnold, chief of the air corps, U. S. army, will serve as best man; and Miss Stephanie Gott, daughter of the bridegroom, will act as maid of honor.

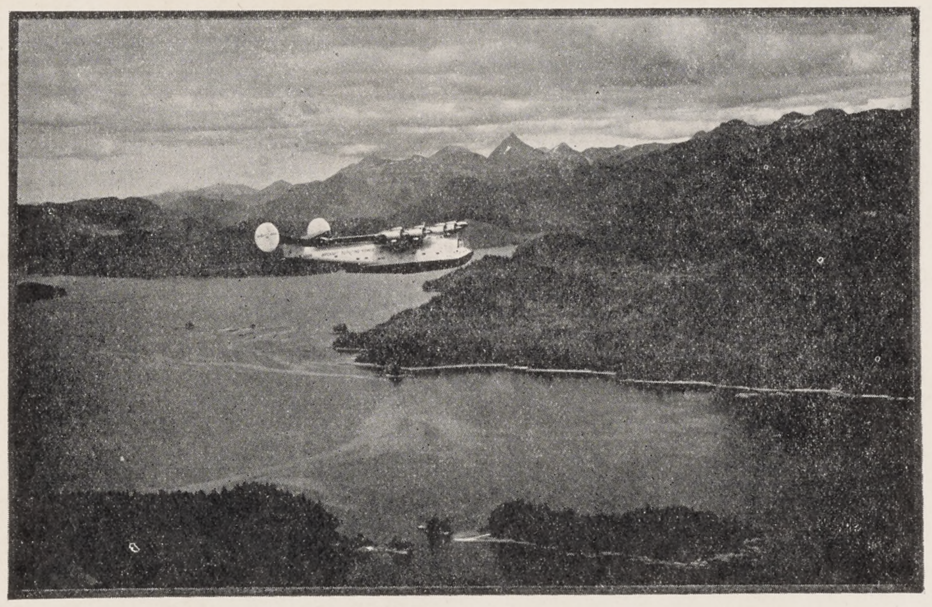
Mr. Gott is vice president of Consolidated Aircraft Corp. of San Diego, and is a graduate of the University of Michigan. He is a member of the Chi Psi fraternity and has been prominent as a pioneer of aviation circles for many years, having been president of Boeing Airplane Co., Keystone Aircraft Corp. and vice president of Fokker Aircraft Corp. before assuming his present duties.

After a motor trip through the Blue Ridge mountains and the Carolinas, Mr. and Mrs. Gott will make their home at San Diego.

April, 1940



In the photo above taken of the plant yard of the Consolidated Aircraft Corp. you will notice at the upper left, the Model 31, Consolidated's latest boat and the plane that boasts the two most powerful radial air-cooled engines ever to be installed in an aircraft. To the upper right is the U. S. Navy's four-engined XPB2Y-1, the plane which has hopped across the continent and back covering the entire distance over land and without benefit of gear for descent upon land. In the center is one of the old timers, a Consolidated P2Y, one of the type which, in a formation of six planes, made the first massed flight from San Francisco to Honolulu (2,414 miles—Jan., 1934). At the bottom, left is a PBY being fitted for special work and to the right the world's largest Amphibian, the XPBY-5A, recently flown to Washington.



A Consolidated Model No. 29 four engined flying boat.—Photo shows the plane in flight near Sitka, Alaska on a recent flight to that territory.

AVIATION - April 1940

Consolidated Aircraft directors have decided not to make a dividend payment for the present, in order to retain company funds within the business and avoid issuance of additional stock. Unannounced foreign orders amounting to $7,000,000 were recently received for an export version of the "PBY" bomber used by the Navy. Backlog includes $20,000,000 in flying boats for the Navy, and $12,000,000 in four-engine bombers for the Air Corps.

.. **H. E. Weihmiller,** Consolidated Aircraft's v. p., since 1937, resigns; was at one time Washington representative of the company.

Joint Farm Bu. Chamber Meet Proves Success

The joint Farm Bureau and Chamber of Commerce dinner meeting held in the Ramona Woman's clubhouse Wednesday night proved a success, and many interesting features were included in the four-hour long program, which began with a splendid dinner served by the Farm Home department and ended with a motion picture tour through the Consolidated Aircraft plant in San Diego, where the PBY bombers were built for the navy.

Anton Pohlman, Farm Bureau unit chairman, presided at the meeting, except for a short chamber of commerce session which was presided over by Don Brown, vice president, in the absence of President Schroeder.

3 San Diego Mfrs. Seek 3,000 Workers; Consair Orders 600

Shortly after news was revealed that Consolidated Aircraft Corp., San Diego, Cal., had agreed to hire 600 graduates of Missouri Aviation Institute, Kansas City, Mo., one source on the west coast estimated that 3,000 factory workers will be added to payrolls of San Diego aircraft plants during the balance of the year in order to meet production schedules called for in filling more than $50,000,000 in back plane orders.

The San Diego aircraft employment situation was outlined in this manner at a recent meeting of personnel managers of Consolidated, Ryan Aeronautical Co. and Solar Aircraft Co., all located at Lindbergh Field, San Diego.

Homer L. Bredouw, head of Bredouw Aeromotive Corp. in Kansas City, operator of Missouri Aviation Institute, recently agreed with Don Frye, Consair's personnel director, to furnish the latter with 25 to 40 graduates weekly for 16 weeks.

The Consolidated order means expansion for the Kansas City mechanics' school. Bredouw said he planned to lease 12,000 sq. ft. of space comprised in a plant adjacent to Kansas City Municipal Air Terminal. The institute's former floor space total was 25,000 sq. ft.

Consolidated Aircraft Corporation

Aeronautical Review

All physical assets, as well as the name and good will of the Hall-Aluminum Aircraft Corporation of Bristol, Penna., have been merged through purchase with Consolidated Aircraft Corporation. Thus tersely may be stated the fact that Hall-Aluminum Corporation is now a part of Consolidated Aircraft Corporation.

Hall-Aluminum Aircraft Corporation had its beginning in Charles Ward Hall, Inc., in 1916. Since that time and until the formation of Hall-Aluminum Aircraft Corporation, Inc., in 1927, Charles Ward Hall, President and sole stockholder had been continuously engaged in research in the use of aluminum alloys in connection with the design and construction of aircraft. Mr. Hall applied for and was granted numerous basic patents relating to this field.

In 1927 Hall-Aluminum Aircraft Corporation was incorporated through the purchase from the late Charles Ward Hall of all assets belonging to Charles Ward Hall, Inc. The new company until its acquisition by Consolidated Aircraft Corporation has been engaged in the design and manufacture of aircraft, particularly flying boats and seaplanes, aircraft parts and sections, and in overhaul and repair work.

Throughout this period and to the present time the corporation produced and supplied parts and standardized aircraft sections to all principal manufacturers and producers in the United States and Canada. Besides supplying the U.S. Navy with many of its aircraft the company has also supplied the Coast Guard with numerous craft.

Farm Bureau to Put On Next C of C Program

The Ramona unit of the Farm Bureau, through its center chairman, Anton Pohlman, will present a fine educational and entertainment program as the main event of the next regular meeting of the Ramona Chamber of Commerce to be held Wednesday night, April 17th in the Ramona Woman's clubhouse, President C. Fred Schroeder announced. The Farm Bureau program will follow a short business session of the chamber of commerce and will consist of a round table discussion by leading county officers and a motion picture.

The following county officers, Wm. Hart, supervisor; Crowell Eddy, county assessor; Sam Claggett, tax collector; Robert Getty, county auditor, will participate in the program Mr. Pohlman announces.

As is usual this will be a dinner meeting. Dinner will be served at 6:30, under the auspices of the Ramona Farm Home department.

The feature of the meeting, according to Mr. Pohlman, will be the showing of a sound movie on the construction of one of the P.B.Y. bombers, made by the Consolidated Aircraft corporation of San Diego. This picture not only shows the interior of the Consolidated plant, but the construction of the P.B.Y. flying boat from blueprint stage until it is rolled down into the bay.

American Aviation 1-1-40

Consolidated Gets $20,000,000 Navy Order; Largest U.S. Airplane Contract

The Navy Dept. signed Nov. 19 a contract with Consolidated Aircraft Corp., San Diego, for an undisclosed number of PBY-5 flying patrol boats amounting to $20,000,000 the largest single aircraft order ever placed either by the Navy or the Army.

Signing of the contract set in motion immediately a 92% expansion plan for the company, according to Maj. R. H. Fleet, president. Additional ground has been leased from the City of San Diego immediately north of the present plant on Lindberg Feld.

Consolidated also has received a $4,700,000 order for patrol boats from an undisclosed foreign purchaser, it has been revealed, while the company's backlog of unfilled orders has risen from $17,900,000 in November to slightly more than $50,000,000. Most of these orders are for various models of the well known PBY's built originally for the Navy and which have been consistently in production. Included in the backlog is the $8,485,000 Army Air Corps order announced last August for XB-24 four-engine landplane bombers, first of which was to have flown by the first of the year.

Engines are not being furnished except for one small contract, otherwise the Consolidated backlog of $50,000,000 could be considered at about $65,000,000 on the same standards that most other industry backlogs are being estimated.

The Aeroplane 4/26/40

Supplies from America

MANY KITES are being flown in the United States since the head of the Allied Purchasing Commission announced last week that contracts would soon be signed for "five types which the United States Government released for sale last week." Curtiss P-40 fighters and Douglas B-20A. light bombers are known to have been ordered. Speculation as to the other types is running its usual course and ranges from the big, four-engined Consolidated bomber to the unorthodox and poorly armed Bell Airacobra fighter.

Between these, Lockheed fighters, Martin bombers and Lockheed light bombers are mentioned, to say nothing of Consolidated flying-boats. General agreement seems to have been reached on the subject of numbers. The Allies are expected to take 5,000 aeroplanes in the course of the next eighteen months. That is a much more likely figure than those estimates which were being circulated a few weeks ago. The choice of types may also prove in the event to be much different from the forecasts. In this matter the Allies will presumably leave the field to the tipsters. Their policy at home is not to announce the nature of the orders placed and the same policy will probably be followed abroad.

We shall be greatly surprised if the Commission elects to order Airacobras. With their untried engine, their unorthodox placing of the engine and their relatively inadequate armament, these seem to offer a maximum of potential troubles in exchange for a few miles an hour more in speed. The same engine, it is true, is used in the Curtiss P-40, and in the twin-engined Lockheed P-38, and none of the American fighters which use radial engines can offer the same performance. Thus the Allies appear to be tempted to take the performance and hope that the snags have been got out of the engine.

Using a new engine a long way from its home has the appearance of rashness. And there has been no hint yet that a British engine can take the place of the Allison in these types. But for this unknown quantity, we could welcome the prospect of high performance machines from America. They will probably arrive while new British types are in production, and from the home and overseas sources the Allies will have a good supply of new machines to oppose to any surprises the German industry is preparing. But if some of the American aircraft should present us with engine problems, half the advantage of the higher performance will have been lost.

Aircraft News 9/16

CONSOLIDATED BOMBER IN MANY TESTS

The new Consolidated Model 32 four-engined land bomber is now undergoing tests at San Diego. Release data on this new plane for the U. S. Army Air Corp has been kept well in hand by the war department as heretofor only a few ground pictures have been officially permitted.

Designated by the Army as the XB-24, the plane marks Consolidated Aircraft Corporation's reentry into the land plane manufacturing field, breaking a virtual specialiaztion which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats. The years of valuable experience garnered from the building of thousands of smaller land planes, and the advanced manufacturing methods evolved in the production of large flying boats, have been poured into this powerful new land plane for our armed forces.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14-cylinder twin row radial air-cooled engines rated at 1200 h.p. each, giving the plane 4800 available horsepower in flight to hurtle it through the air. The propellors are Hamilton standards of the three-bladed hydroma-

Consolidated Bomber In Many Tests

(Continued from Page 1)

tic constant speed type, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with the engine nacelles mounted flush with the upper surface of the center section.

The approximate gross weight of the airplane is 40,000 pounds, wing span, 110 feet; length of fuselage, 64fe et, and over-all height, 19 feet. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with single wheel forward. This retracts into the fuselage. The rear, or main landing wheels retract int the wing wells.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb carrying capacity of approximately four tons."

BeeHive - March 1940

Pratt & Whitney engines and Hamilton Standard propellers have been specified for two new planes recently delivered to the U. S. Army.

One, the North American AT-6 advanced trainer, is a two-place, all-metal, monoplane, equipped with a nine-cylinder Pratt & Whitney engine and a Hamilton Standard constant speed propeller.

The second plane is the four-motored Consolidated XB-24. Powered by Pratt & Whitney 1,200 horsepower Twin Wasps and equipped with three-bladed Hamilton Standard Hydromatic propellers, the sleek new bomber is said to have a bomb-carrying capacity of about four tons.

State Chamber of Commerce Directors Arrive for Conference With San Diego Group

Directors of the state chamber of commerce, who arrived here today from the north for a meeting at the local chamber, are, left to right, above, R. K. Davies, San Francisco; C. C. Teague, Santa Paula; Col. William M. Garland, Los Angeles; Harrison S. Robinson, Oakland; Joseph R. Knowland, Oakland; Preston Hotchkis, Los Angeles; A. C. Mattei, San Francisco; D. P. Boothe, Modesto; W. C. Mullendore, Los Angeles; A. E. Roth, San Francisco; Hal Hotchkiss, San Diego; Harry Chandler, Los Angeles; R. B. Hale, San Francisco; A. T. Spencer, Gerber; Maj. R. H. Fleet, San Diego; M. B. Silberberg, Los Angeles; Parker Frisselle, Kearney Park.

RELIEF HELD KEY TO TAXES; NEW OFFICERS ELECTED

Disposition by the legislature of the relief situation continues to be the keynote to the tax situation, directors of the state chamber of commerce were told today at a meeting in the local chamber.

The directors arrived at Lindbergh field today aboard a giant Western Air Express mainliner. They were met by Maj. R. H. Fleet and Hal Hotchkiss, local members of the board; Maj. T C. Macaulay, executive manager of the local

(Continued on Page 4A, Col. 2)

RELIEF [illegible] KEY TO TA[illegible]; NEW OFFICERS ELECTED

CONTINUED FROM PAGE ONE

chamber, and other chamber officials.

Inspect Plane Plant

After a morning meeting at the chamber they were guests of Fleet, president of Consolidated Aircraft Corp., at luncheon, and then inspected the huge aircraft plant. They were to return north by plane late this afternoon.

Preston Hotchkiss, executive vice president of the Pacific Indemnity Co., Los Angeles, elected first vice president of the state chamber today, presided at the morning meeting in the absence of Alfred J. Lundberg, Oakland industrialist, elected president. A. E. Roth, president of the San Francisco Employers' council, became second president. Lundberg succeeded A. J. McFadden, Santa Ana orchardist, as president.

McFadden and James Mussatti, San Francisco, general manager of the state chamber, and E. W. Murphy, Los Angeles, a director, drove here for the meeting.

A report of the state-wide tax committee to the board said in part:

"If the limited appropriative measure is finally approved in its present form, relief appropriations for the present biennium will have amounted to the following: By 1939 January session, $35,525,000; by special session of February, 1940, $13,800,000; by special session May, 1940, $24,347,091; total, $73,682,091.

"This would leave an appropriation for the last quarter of the biennium—April, May and June, 1941—still to be made, which, if in line with the rate of past and present appropriations, would bring the biennial total up to about $82,500,000 as compared to expenditures of $75,729,355 the previous biennium."

"California Trade Good"

"This outcome, while extremely gratifying from many viewpoints, still leaves in abeyance the basic problem of relief administration and financing, regarding which our committee will submit further recommendations to this board at its next meeting. All administration proposals for new taxes are still pending in committees of both houses."

The research department report on economic conditions stated: "Recent business statistics for California and the nation have been more encouraging, indicating that the minor recession, the first quarter of this year, reached bottom last month. The present European situation, however, has caused sharp declines in some commodity and stock prices, and has engendered general nervousness, despite stimulus of an expensive national rearmament and preparedness program that wil lspeed up operations in many industries and stimulate business generally.

"A comparison of California business indexes with similar national indexes shows the decline in business the first quarter was less severe in California than for the United States as a whole. Further analysis reveals the present level of California business is from 10 to 15 percent above the level of a year ago.

Building Increase Cited

"California employment and payrool statistics reflect a moderate increase in total manufacturing activity from March to April and a gain of more than 15 percent over April last year. As for the individual industries or groups of industries, the percentage changes varied considerably. The aircraft, pulp and paper, plywood, and those producing parts and accessories continue to operate at capacity levels.

"New residential building was the bright spot in the building industry during April. While the seasonally corrected index for total value of permits dropped about 4 percent from March to April, the adjusted index for new homes advanced nearly 13 percent, indicating a substantial decline in nonresidential building. The residential index advanced 20 percent since April, 1939.

"Retail distribution since Jan. 1 has shown no material change beyond normal seasonal fluctuations. Sales of independent stores the first four months this year aggregated 4½ percent more than for the same period last year. Demand for motor vehicles, furniture and building supplies was especially strong, whereas sales of department and apparel stores was less favorable.

"Farm income in California continues above the level of a year ago by slightly more than 15 percent. Planting of truck crops, haying, thinning of deciduous fruits, shearing of sheep, and harvests of vegetables, strawberries, cherries and Valencia oranges progressed. Pastures and ranges remained in good condition, but were drying rapidly in southern districts. Cotton, home gardens and livestock remanied in good condition."

FLEET SUGGESTS LONGER WEEK FOR AIRPLANE PLANTS

The United States could "accelerate" plane deliveries "by increasing the work week to include a full working day Saturday," Maj. Reuben H. Fleet, head of Consolidated Aircraft Corp., told a Buffalo Aero club dinner group, The Associated Press reported yesterday.

Fleet reported 684 men at work in the Fleet Aircraft Co.'s plant at Ft. Erie, Ont., and added he noted 13 planes ready for delivery to the Canadian air force.

Consolidated Aircraft here is on a 40-hour work week, three shifts employed to extend around the 24-hour period each day, it was reported. This schedule "will be maintained until the government wants to permit a 48-hour work week," a Consair official said.

that most cases of hysteria are the indirect result of shocks, emotional and usually sexual in nature. Memories, fears and desires, he felt, may be suppressed and pushed into the subconscious only to find eventual expression in dreams or hysteria. He was [illegible] factor the wish gratified in the dream is the one that has been left unsatisfied in the daytime. He insisted that a newly married couple never dream of each other and that no person dreams of his work unless he has been thwarted in some part of it. To Freud virtually every dream is related to hateful wishes or to the interference of other persons with our sex wishes. Many scientists admit that Freud's theories, while stimulating, are merely impressionistic pictures of the truth and cannot be accepted as authentic generalities.

No LESS than 600,000,000 lives have been lost in a catastrophe that recently swept that many little shellfish to oblivion along the English coast. Biologists who visited the scene of death report they measured a pile of the shellfish remains that was nine miles long, six feet wide and ten inches deep. A single cubic foot of this continuous melancholy mound contained 3600 dead. An "unusual" combination of tides and winds is blamed for the carnage which scientists fear will result in a serious shortage of food for other sea dwellers in that locality.

RANK flavors in milk can be prevented if cows are fed food that contains plenty of carotene, the plant pigment which is the source of Vitamin A, the University of California College of Agriculture reports. Carotene concentrate, carrots, green feeds, and even alfalfa that is so cured that it retains its green color, makes milk taste better and increases its nutritional value to human beings.

QUESTIONS:

1.—How old are the oldest known human bones?

2.—When did man first harness fire?

3.—Are old people stupid?

4.—Why were early New England brides once married in borrowed sheets?

5.—Why does the Pasadena screech owl live longer than other birds of prey?

ANSWERS:

1.—The Sinanthropus skull found in China is believed to be upward of a million years old.

2.—There is some evidence, including deeply buried ashes, that man has used fire for almost a million years.

3.—In a University of California test of the intelligences of 2331 persons, some of the best scores were made by those over 70. The average of those over 70 was half a point higher than that for the whole group. Two persons over 85 made scores only one or two points below the general average.

4.—If a bride was married while in possession of any property of her own, even clothing, her husband, because of a legal technicality, became liable and might be jailed for his wife's debts.

5.—A University of California report discloses that the "Pasadena screech owl is known to attain the age of 13 years, whereas sparrow hawks and Pacific horned owls live about two years." The research conclusion is that the screech owl knows how to hide from "the small boy with his .22 rifle."

~~Aircraft News~~

CONSOLIDATED BOMBER IN MANY TESTS

5/16

The new Consolidated Model 32 four-engined land bomber is now undergoing tests at San Diego. Release data on this new plane for the U. S. Army Air Corp has been kept well in hand by the war department as heretofor only a few ground pictures have been officially permitted.

Designated by the Army as the XB-24, the plane marks Consolidated Aircraft Corporation's reentry into the land plane manufacturing field, breaking a virtual specialiaztion which has brought Consolidated the distinction of being the world's largest manufacturer of flying boats. The years of valuable experience garnered from the building of thousands of smaller land planes, and the advanced manufacturing methods evolved in the production of large flying boats, have been poured into this powerful new land plane for our armed forces.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14-cylinder twin row radial air-cooled engines rated at 1200 h.p. each, giving the plane 4800 available horsepower in flight to hurtle it through the air. The propellors are Hamilton standards of the three-bladed hydroma-

Consolidated Bomber In Many Tests

(Continued from Page 1)

tic constant speed type, 12 feet in diameter. Fowler flaps extend inboard of the ailerons in the wing of high aspect ratio, with the engine nacelles mounted flush with the upper surface of the center section.

The approximate gross weight of the airplane is 40,000 pounds, wing span, 110 feet; length of fuselage, 64fe et, and over-all height, 19 feet. Tactical requirements are for a crew of from six to nine persons, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with single wheel forward. This retracts into the fuselage. The rear, or main landing wheels retract int the wing wells.

While the performance figures are strictly confidential, an official release states: "This airplane, from preliminary examinations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb carrying capacity of approximately four tons."

Beehive - March 1940

Pratt & Whitney engines and Hamilton Standard propellers have been specified for two new planes recently delivered to the U. S. Army.

One, the North American AT-6 advanced trainer, is a two-place, all-metal, monoplane, equipped with a nine-cylinder Pratt & Whitney engine and a Hamilton Standard constant speed propeller.

The second plane is the four-motored Consolidated XB-24. Powered by Pratt & Whitney 1,200 horsepower Twin Wasps and equipped with three-bladed Hamilton Standard Hydromatic propellers, the sleek new bomber is said to have a bomb-carrying capacity of about four tons.

State Chamber of Commerce Directors Arrive for Conference With San Diego Group

Directors of the state chamber of commerce, who arrived here today from the north for a meeting at the local chamber, are, left to right, above, R. K. Davies, San Francisco; C. C. Teague, Santa Paula; Col. William M. Garland, Los Angeles; Harrison S. Robinson, Oakland; Joseph R. Knowland, Oakland; Preston Hotchkis, Los Angeles; A. C. Mattei, San Francisco; D. P. Boothe, Modesto; W. C. Mullendore, Los Angeles; A. E. Roth, San Francisco; Hal Hotchkiss, San Diego; Harry Chandler, Los Angeles; R. B. Hale, San Francisco; A. T. Spencer, Gerber; Maj. R. H. Fleet, San Diego; M. B. Silberberg, Los Angeles; Parker Frisselle, Kearney Park.

RELIEF HELD KEY TO TAXES; NEW OFFICERS ELECTED

Disposition by the legislature of the relief situation continues to be the keynote to the tax situation, directors of the state chamber of commerce were told today at a meeting in the local chamber.

The directors arrived at Lindbergh field today aboard a giant Western Air Express mainliner. They were met by Maj. R. H. Fleet and Hal Hotchkiss, local members of the board; Maj. T C. Macaulay, executive manager of the local

(Continued on Page 4A, Col. 2)

RELIEF [illegible] KEY TO TA[illegible]; NEW OFFICERS ELECTED

CONTINUED FROM PAGE ONE

chamber, and other chamber officials.

Inspect Plane Plant

After a morning meeting at the chamber they were guests of Fleet, president of Consolidated Aircraft Corp., at luncheon, and then inspected the huge aircraft plant. They were to return north by plane late this afternoon.

Preston Hotchkiss, executive vice president of the Pacific Indemnity Co., Los Angeles, elected first vice president of the state chamber today, presided at the morning meeting in the absence of Alfred J. Lundberg, Oakland industrialist, elected president. A. E. Roth, president of the San Francisco Employers' council, became second president. Lundberg succeeded A. J. McFadden, Santa Ana orchardist, as president.

McFadden and James Mussatti, San Francisco, general manager of the state chamber, and E. W. Murphy, Los Angeles, a director, drove here for the meeting.

A report of the state-wide tax committee to the board said in part:

"If the limited appropriative measure is finally approved in its present form, relief appropriations for the present biennium will have amounted to the following: By 1939 January session, $35,525,000; by special session of February, 1940, $13,800,000; by special session May, 1940, $24,347,091; total, $73,682,091.

"This would leave an appropriation for the last quarter of the biennium—April, May and June, 1941—still to be made, which, if in line with the rate of past and present appropriations, would bring the biennial total up to about $82,500,000 as compared to expenditures of $75,729,355 the previous biennium."

"California Trade Good"

"This outcome, while extremely gratifying from many viewpoints, still leaves in abeyance the basic problem of relief administration and financing, regarding which our committee will submit further recommendations to this board at its next meeting. All administration proposals for new taxes are still pending in committees of both houses."

The research department report on economic conditions stated: "Recent business statistics for California and the nation have been more encouraging, indicating that the minor recession, the first quarter of this year, reached bottom last month. The present European situation, however, has caused sharp declines in some commodity and stock prices, and has engendered general nervousness, despite stimulus of an expensive national rearmament and preparedness program that wil lspeed up operations in many industries and stimulate business generally.

"A comparison of California business indexes with similar national indexes shows the decline in business the first quarter was less severe in California than for the United States as a whole. Further analysis reveals the present level of California business is from 10 to 15 percent above the level of a year ago.

Building Increase Cited

"California employment and payrool statistics reflect a moderate increase in total manufacturing activity from March to April and a gain of more than 15 percent over April last year. As for the individual industries or groups of industries, the percentage changes varied considerably. The aircraft, pulp and paper, plywood, and those producing parts and accessories continue to operate at capacity levels.

"New residential building was the bright spot in the building industry during April. While the seasonally corrected index for total value of permits dropped about 4 percent from March to April, the adjusted index for new homes advanced nearly 13 percent, indicating a substantial decline in nonresidential building. The residential index advanced 20 percent since April, 1939.

"Retail distribution since Jan. 1 has shown no material change beyond normal seasonal fluctuations. Sales of independent stores the first four months this year aggregated 4½ percent more than for the same period last year. Demand for motor vehicles, furniture and building supplies was especially strong, whereas sales of department and apparel stores was less favorable.

"Farm income in California continues above the level of a year ago by slightly more than 15 percent. Planting of truck crops, haying, thinning of deciduous fruits, shearing of sheep, and harvests of vegetables, strawberries, cherries and Valencia oranges progressed. Pastures and ranges remained in good condition, but were drying rapidly in southern districts. Cotton, home gardens and livestock remanied in good condition."

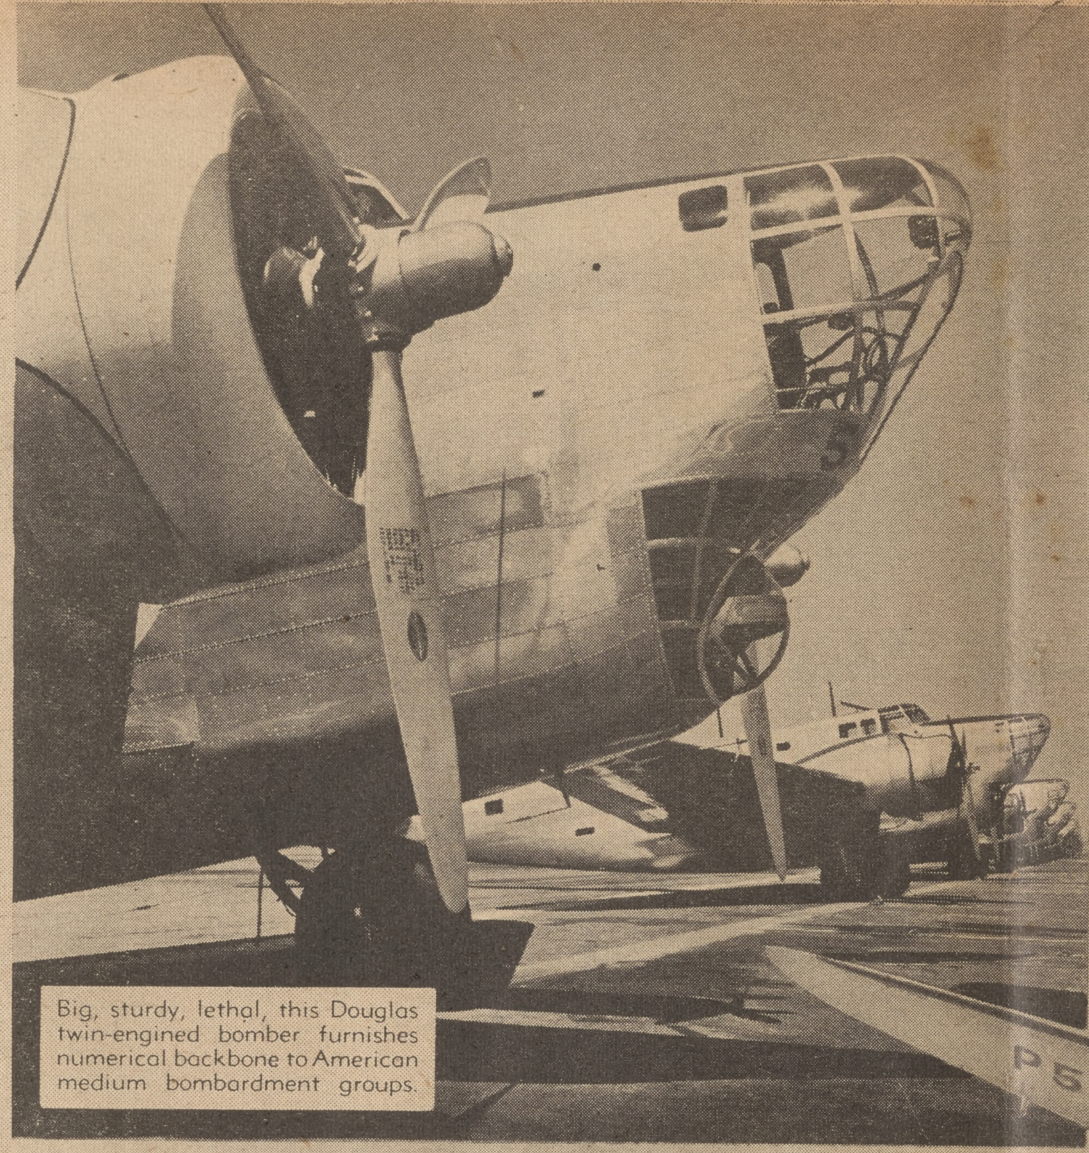
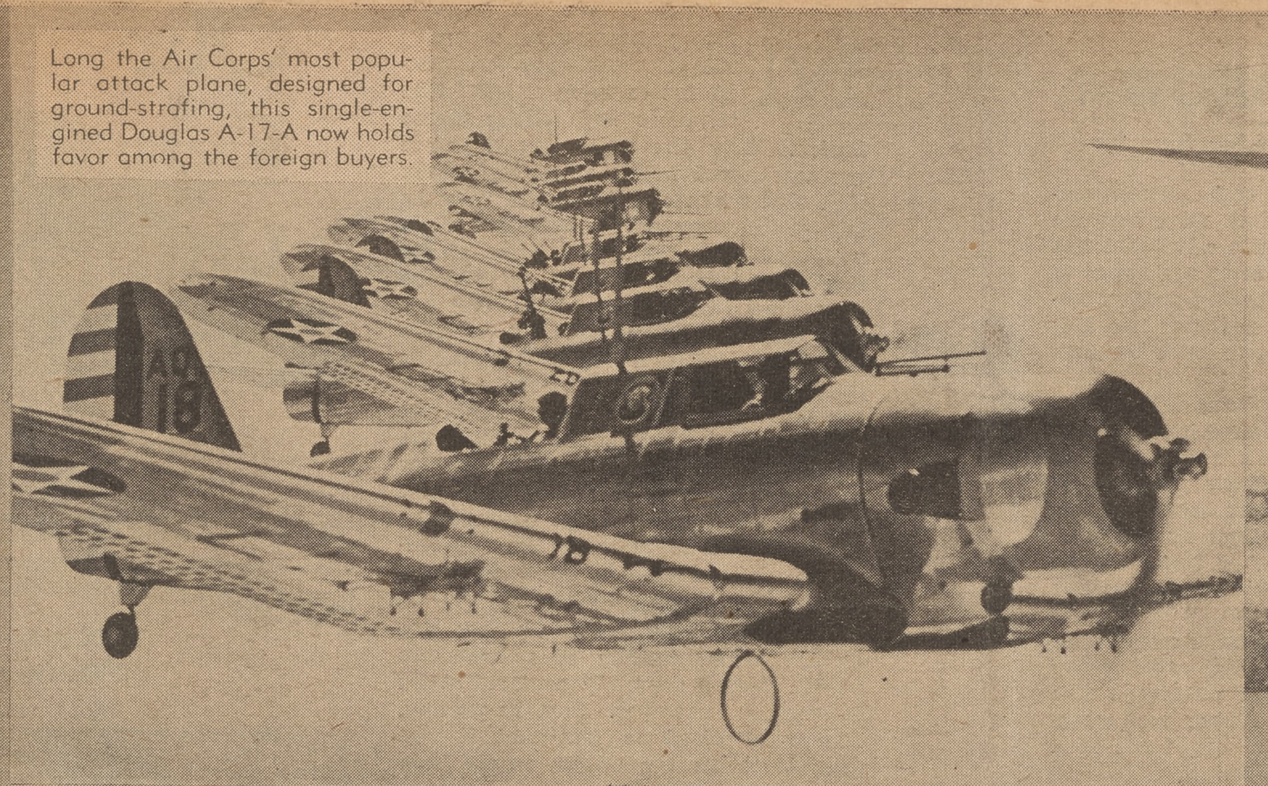
C. N. T. drops us a line and suggests a better one—"Watch us fly."

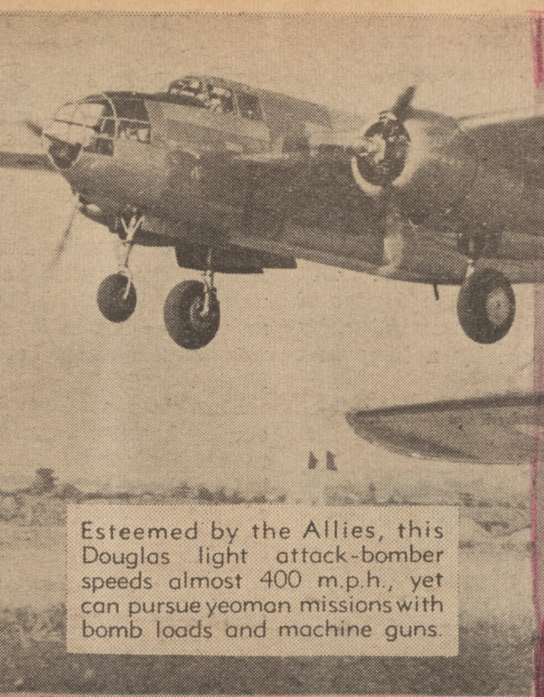
* * *



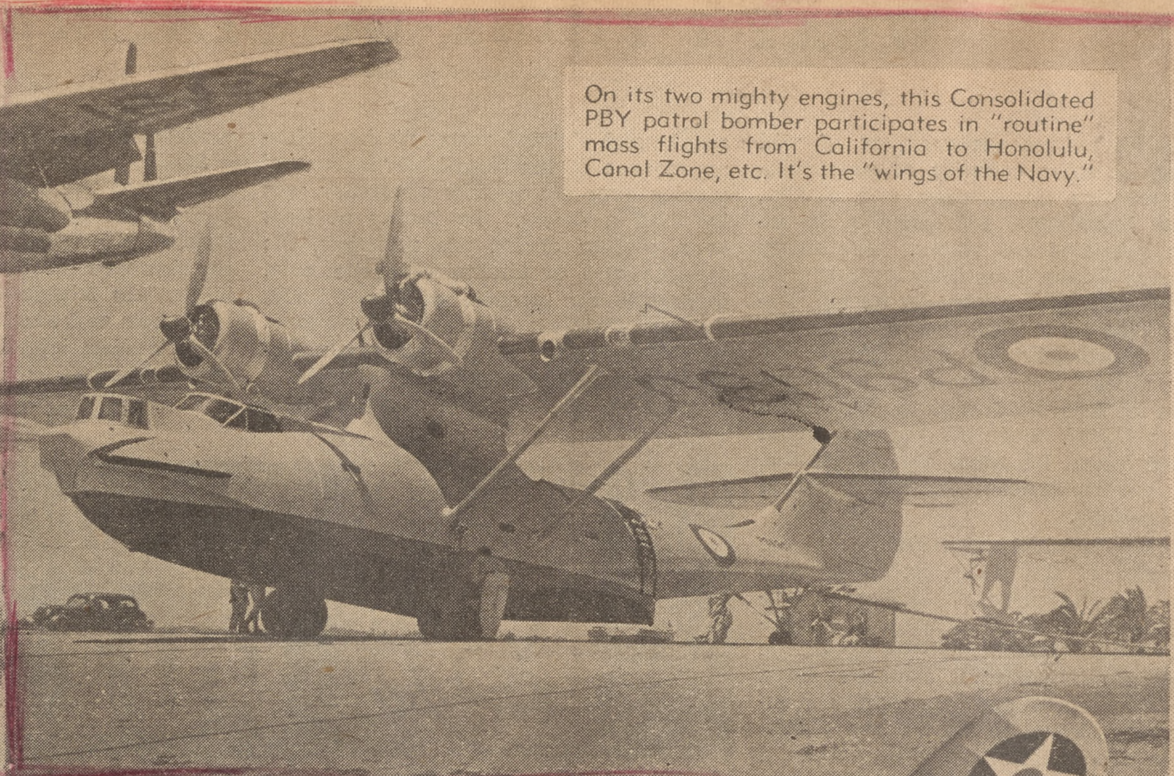
Big, sturdy, lethal, this Douglas twin-engined bomber furnishes numerical backbone to American medium bombardment groups.



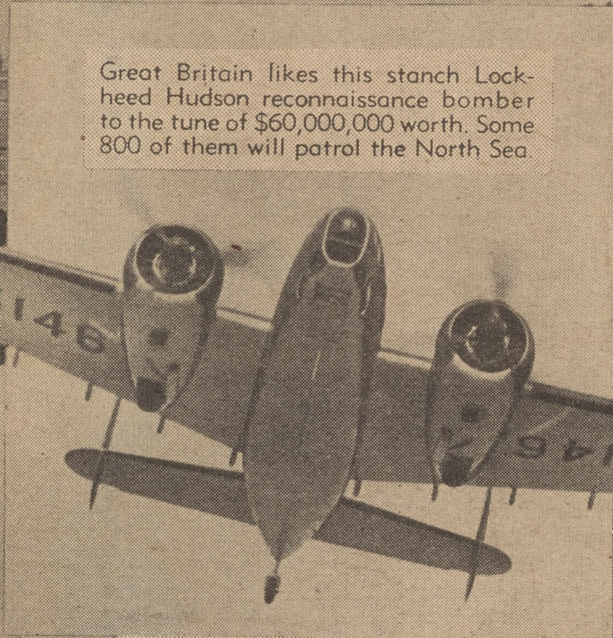
Long the Air Corps' most popular attack plane, designed for ground-strafing, this single-engined Douglas A-17-A now holds favor among the foreign buyers.



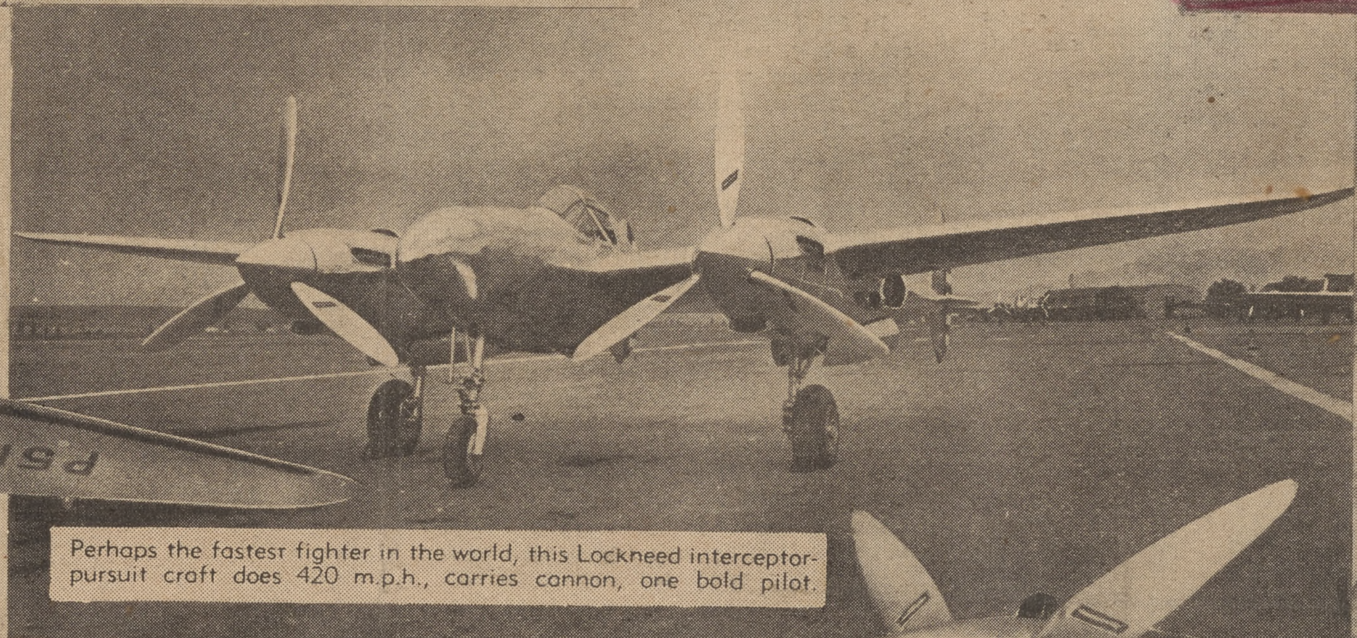
Esteemed by the Allies, this Douglas light attack-bomber speeds almost 400 m.p.h., yet can pursue yeoman missions with bomb loads and machine guns.



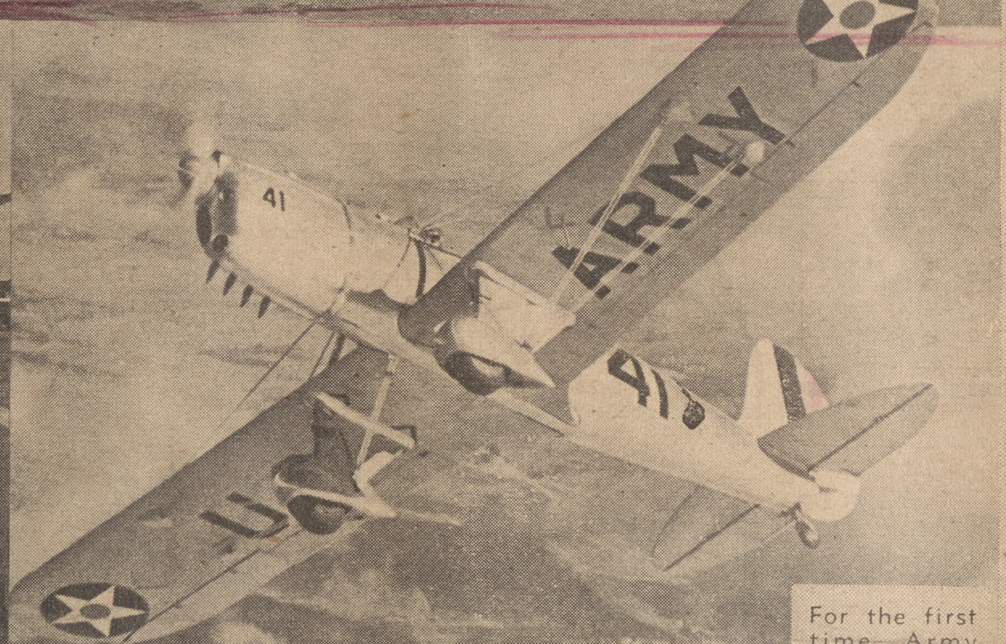
On its two mighty engines, this Consolidated PBY patrol bomber participates in "routine" mass flights from California to Honolulu, Canal Zone, etc. It's the "wings of the Navy."



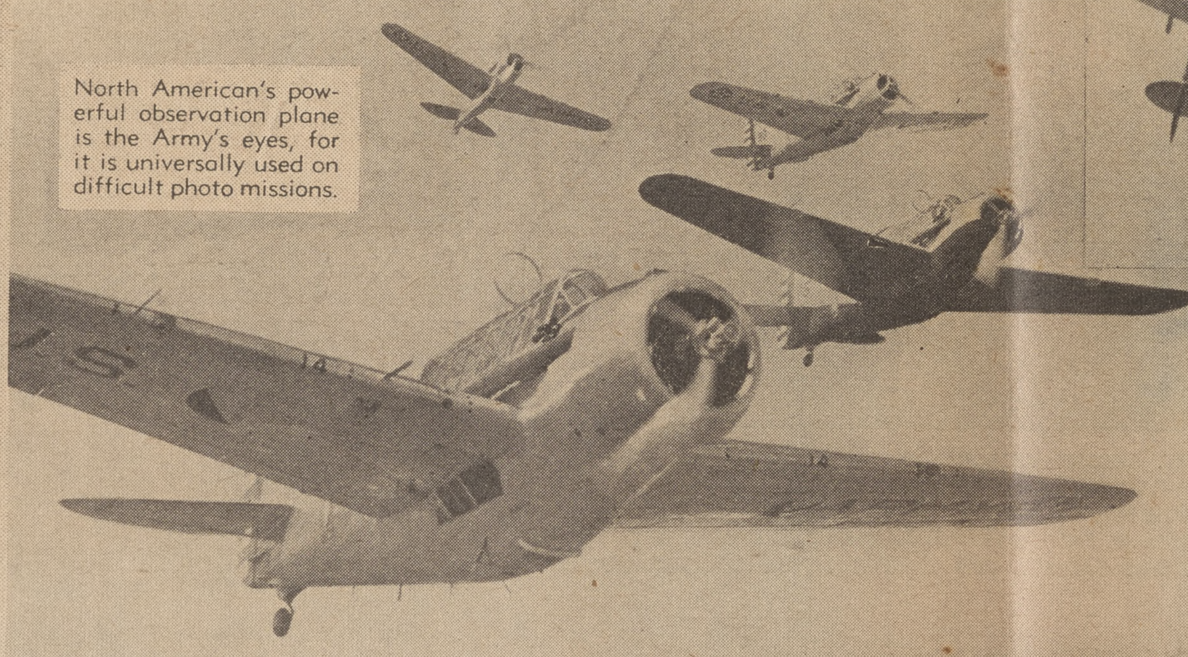
Great Britain likes this stanch Lockheed Hudson reconnaissance bomber to the tune of $60,000,000 worth. Some 800 of them will patrol the North Sea.



Perhaps the fastest fighter in the world, this Lockneed interceptor-pursuit craft does 420 m.p.h., carries cannon, one bold pilot.



For the first time, Army cadets now are learning military flight rudiments in metal monoplanes. This Ryan primary trainer is "it."



North American's powerful observation plane is the Army's eyes, for it is universally used on difficult photo missions.

Made in Southern California

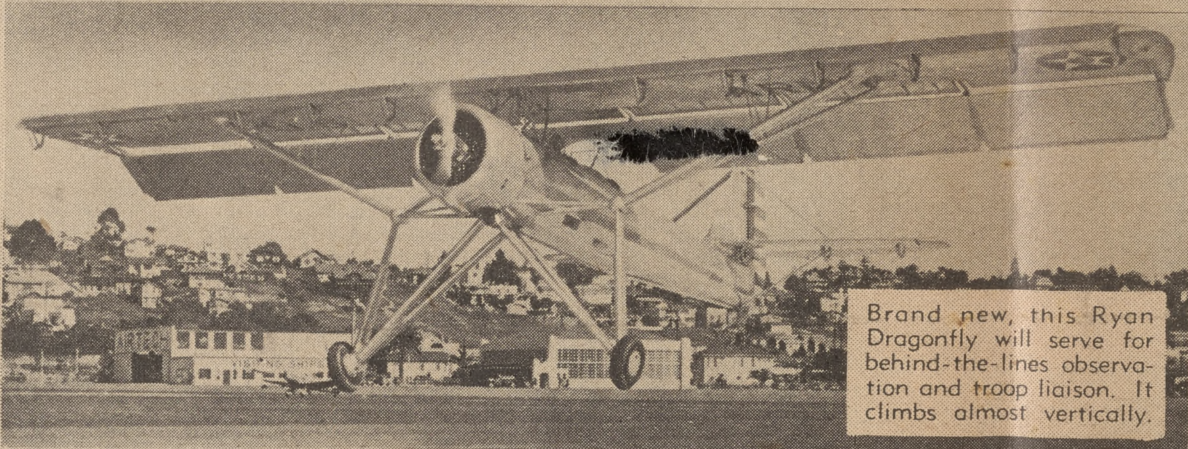
● Military experts agree that the nation with the mightiest sky fleet holds the whip hand in modern warfare. Thus Southern California is one of the greatest whip makers in the world. For from its thriving factories will pour $100,000,000 worth of export fighting craft in 1940.

Its backlog of $250,000,000—probably $450,000,000 by the time you read this—stands predominantly military.

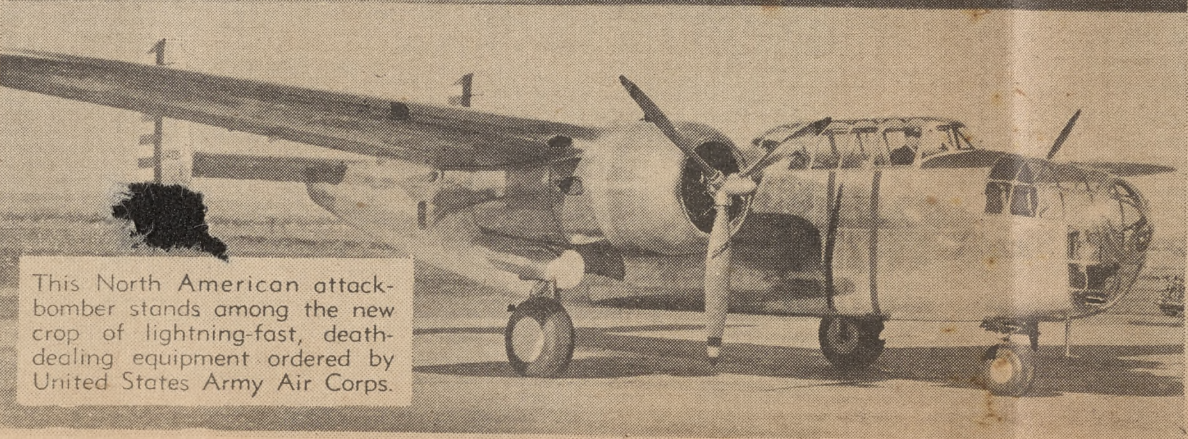
In Southern California are built the world's biggest bombers, fastest pursuit ships, swiftest seaplanes. This isn't boasting. It is fact.

Best customers are Great Britain and France. America's onetime allies know that United States production will soon touch 17,000 ships a year. They want most of these. So they look to Southern California, center of half this gigantic output. For here England hopes to acquire the 400-m.p.h. fighters capable of intercepting raiding bombers before they reach London. France wants twin-engined attack bombers that spray death with machine guns and drop demolition charges.

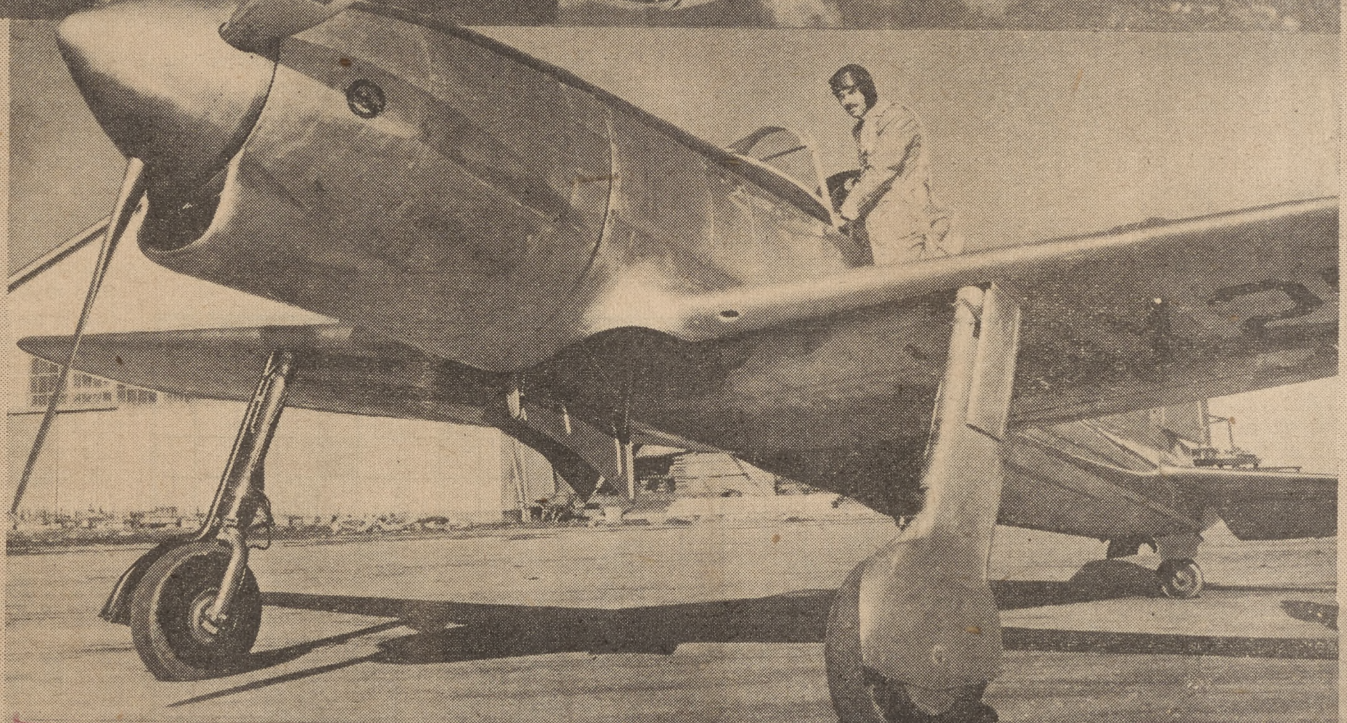
But as the industry mushrooms, leaders declare that these breathtaking foreign sales boost America's own production capacity—against M-Day when our own sinews of war must be strong and ready.



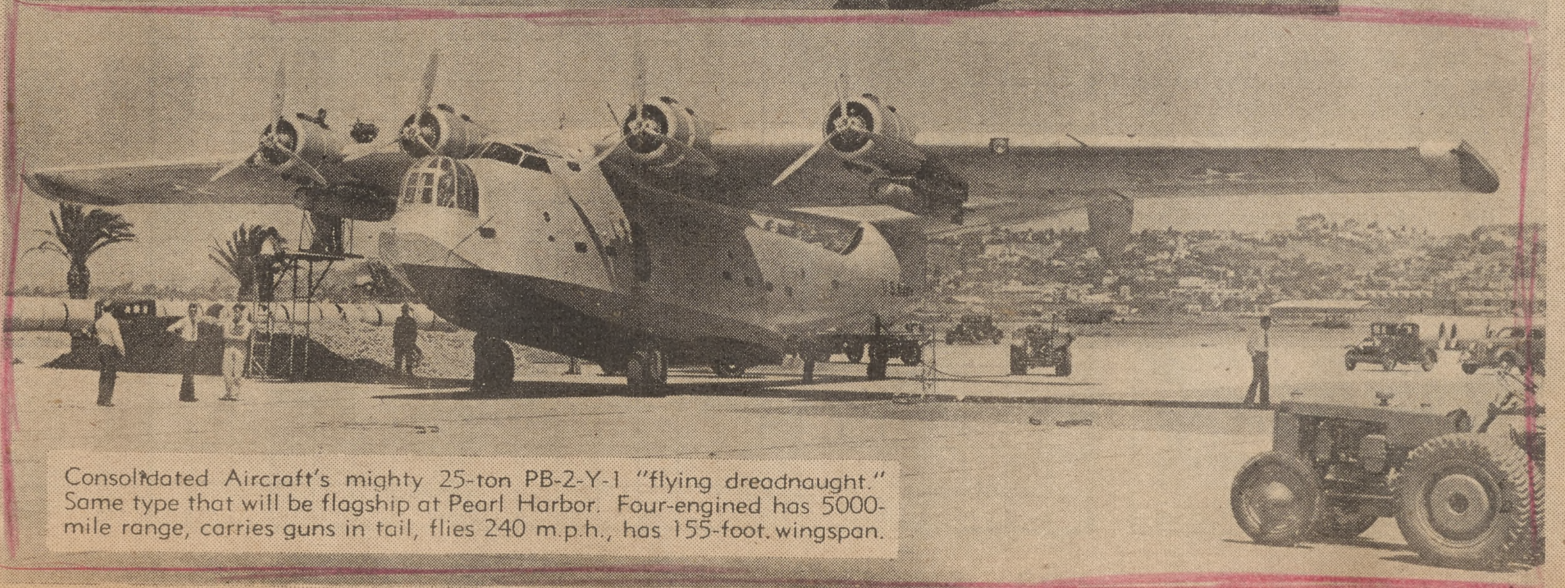
Brand new, this Ryan Dragonfly will serve for behind-the-lines observation and troop liaison. It climbs almost vertically.



This North American attack-bomber stands among the new crop of lightning-fast, death-dealing equipment ordered by United States Army Air Corps.



Bulletnosed, this Vultee Vanguard pursuit almost touches 400 m.p.h. and can attack marauding bombers with cannon, guns, small bombs.



Consolidated Aircraft's mighty 25-ton PB-2-Y-1 "flying dreadnaught." Same type that will be flagship at Pearl Harbor. Four-engined has 5000-mile range, carries guns in tail, flies 240 m.p.h., has 155-foot wingspan.

Sunday April 28th 1940.

AIRFAX

By Derek White

Military activity gets the headlines, but commercial operations forge ahead, and will continue to at increasing speed. More thousands of men are learning to fly than the public realizes. In addition to the 95,000 civilian pilots being trained at Government cost, other thousands are learning at their own expense. One-third of these will buy airplanes . . . Within the next two years 15,000 commercial airplanes will be built and sold, ranging from 40 h. p. light planes to $25,000 luxury ships . . . In addition, 17,000 commercial aircraft engines, 64,000 airplane tires and 22,000,000 gallons of gasoline will be bought by commercial and pleasure flyers.

BITS OF NEWS: General Motors, in addition to other aircraft holdings, will manufacture airplanes under their own name . . . A Dayton aircraft accessory manufacturer will consolidate with a Los Angeles builder of precision parts . . . Don't be surprised if North American gets an order for 500 pursuits . . . Glenn L. Martin earned $4,110,605 last year . . . Stinson Aircraft will move to Nashville, Tenn. . . . Alaskan Airlines transported 4,000,000 pounds of freight, 500,000 pounds of mail and 30,000 passengers during the past 12 months . . . Rearwin Aircraft will enter the light plane market . . . The new mystery Douglas bomber, with 220-foot wing span, will be tested within 30 days . . . First Los Angeles-built light plane will be marketed by Interstate Aircraft and Engineering under another name.

A FEW FIGURES: Total plant area of all U. S. airplane and engine factories is 12,250,000 square feet. Total number of employees now engaged in building planes and motors is 105,000. With present plants and personnel it would take three years to build the airplanes now on order by the Allies, but delivery by July of 1941 is specified . . . Germany now is said to have an air force of 31,000 planes; England 15,000 and France 6000. Of these, one-half are bombing and combat ships, the balance transport, reserve and training models . . . In other words 25,000 ships, on both sides in the present war, are available for fighting. With total war, 30 per cent will be destroyed per month, according to favored military estimates. One authority has estimated destruction at 55 per cent per month. The lower estimate means destruction of 96,000 ships per year . . . With present plants and personnel working day and night, France, England and the United States can produce 30,000 airplanes per year . . . Where will the other 60,000 come from?

THE ANSWER: One year from today airplane and engine plants in the U. S. will cover 25,000,000 square feet; total number of aircraft workers will be 250,000. Any aircraft executive knows this, but few will admit it if you ask.

SWIFT AND SURE: During a recent 60-day period this writer flew more than 9000 miles, mostly at night, which is farther than his father travelled in his entire life . . . More men are flying now because wives have been convinced that flying is safe . . . Airlines have completed 13 consecutive months of flying without a single accident. Even the 1938 record of five accidents, made flying safer than staying at home, because during the past five years accidents in homes killed 167,000 persons.

TRENDS TODAY: First three-wheeled landing gears were adopted in 1910, later abandoned, and are now almost standard on newest planes . . . First successful planes used pusher propellers, which are more efficient. They were abandoned for tractor propellers in 1915. New Bell twin-engined Airacuda has pusher propellers. You will see more in the future . . . First aircraft engines were liquid cooled, then abandoned for air-cooled motors. Most powerful engine today is the Allison, which is liquid cooled. The first manufacturer who brings out a reliable, low-priced liquid-cooled aircraft engine in the 150 to 200 h. p. class will skim the cream of the motor business and make a fortune.

AIRPLANE COSTS: How much does it cost to produce a new type airplane? Most costly was Douglas DC4 which cost $1,800,000 and required nearly three years for engineering and building. First Boeing Flying Fortress was designed and built in six months at cost of $500,000. A single-engined attack-bomber cost $175,000 for engineering and construction; another of the same size and approximate speed was engineered and built for $22,000. The cost of a new type seems to depend upon the amount of money available and the men responsible.

SEEN HERE AND THERE: Claude Ryan, head of Ryan Aeronautical Company, in Los Angeles on business . . . Jack West, who writes more aero advertising than any other Los Angeles man, out after a new account . . . Hal Curtis, best informed man in America on stainless steel aircraft construction . . . Leroy Prinz, Hollywood director, who will go on the board of a Los Angeles Aircraft Company . . . Norman Davidson, assistant to E. N. Gott, vice president of Consolidated Aircraft, who would not admit that his company is on the verge of a large bomber contract . . . Ben O. Howard, air-racer and manufacturer, talking about a proposed air freight line . . . Harvey Martin, airplane distributor, who has bought the factory building of American Aircraft, in which he will open a school on June 1 . . B. L. Ball, financier, who may back both an aircraft manufacturing company and an airline.

An American's Survey of Orders Placed in the United States

By **LEONARD ENGEL**

WASHINGTON.

AT a time when what is happening in London is so obviously more meaningful, I have as little desire to write as you have to read about British plane orders in the United States. But American military planes are becoming increasingly important to the United Kingdom, and a survey of the American aircraft industry, particularly as it relates to aid to Britain, is once more urgent. The last three months over here have been both hectic and confusing.

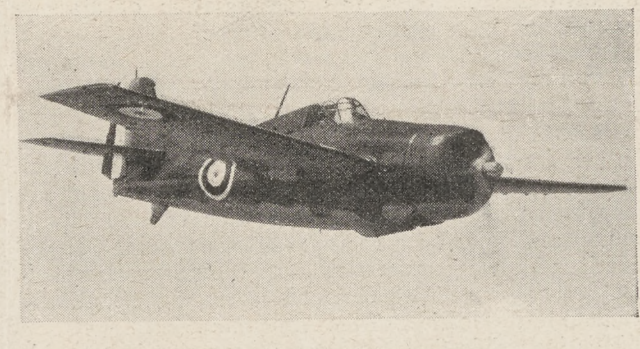
Here is as clear a picture as it is possible to paint at this time. Remember, if some of the facts and figures given are only approximate, that there is not only the censorship in England, but what amounts now to an informal one almost equally severe in the United States, so far as military matters are concerned.

Total U.S. production is fluctuating between 800 and 1,000 a month, light and private planes excepted, of course, but with big transports included along with military machines. In July it was 895, of which 236, according to a published statement by William S. Knudsen, General Motors president who is now in charge of production for the National Defence Advisory Commission, were for the British Purchasing Commission account. August figures show British shipments of 289 planes, although total production was down to less than 850. The September total U.S. output may be somewhat lower still; the American industry is now passing through the stages the British industry went through a year and a half to two years ago. Deliveries to England will range between 300 and 350 monthly for the next two months, rising to 550 monthly early in 1941. It is not expected that they will reach the thousand-per-month level until late next year.

British aircraft orders, which have long since passed the $1,200,000,000 mark, cover just about every usable military type available. Curtiss P-36s. (Cyclones or Twin Wasp engines) are still being taken (they were originally ordered by the French), but completion of the order is due almost at once. Curtiss Tomahawks or P-40s (Allison V-1710), some of which are being delivered, and P-46s (an improved near-400-mile-an-hour P-40) are on order. Deliveries of the P-46 are due to begin toward the end of the year in place of the present P-40s. Lockheed's twin-engined P-38 (Allisons), which does 410 miles an hour despite the semi-official 500 m.p.h. ballyhoo, is also expected to begin rolling in December, from a new Lockheed plant specially built for its production. Several hundred were ordered by the Purchasing Commission.

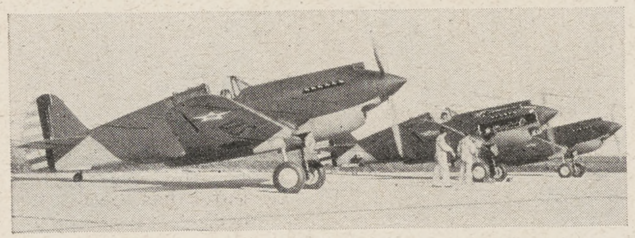
Currently being delivered are export versions of the U.S. Navy's Grumman F4F-3 and Brewster F2A-1 monoplane fighters (both about 320 miles an hour). Not more than a hundred of each type are, however, involved.

The R.A.F. is also likely to wind up with 120 Vultee Vanguards (with Twin Wasp rather than the Double Wasp engines tried in the prototype). The Vanguards were ordered and paid for by Sweden. But, following the invasion of Norway and for fear the planes would fall into German hands, the State Department cancelled the Swedish export licence covering the planes. Now the Swedes would like to sell them. But London is the only



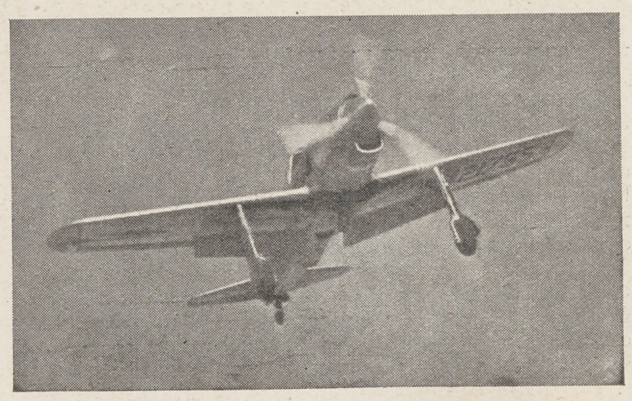
The Grumman F4F-3 has been ordered in small numbers.

The British name for the Brewster F2A-1 is the Buffalo.



Curtiss P-40 Tomahawks, with Allison engines, are now being delivered.

The Lockheed P-38 (Allisons) does 410 m.p.h.



The Vultee Vanguards for the R.A.F. will have Twin Wasp engines. Note wide track.

Sunday April 28-40

Flying Boat Plants Adding 100 Employees Each Week

Total of 10,000 Expected at Consolidated

By Derek White

Just 40 minutes by air south of Los Angeles, on San Diego Bay, is the plant of the Consolidated Aircraft Corporation, builders of giant Naval Patrol flying boats. The company is now engaged in an expansion to end all expansions, in expectation of additional orders which will dwarf their present backlog of more than $50,000,000.

Present plant area is 447,332 square feet. This is being increased by 87 per cent, which will bring total floor area to 843,332 square feet. Approximately 5000 employees are now on the payroll, but men are being added at the rate of more than 100 per week so that when the new plant is completed, employees will total 7500. Approximately 10,000 men will be employed by the end of this year.

Consolidated Aircraft has been built for an initial capital of only $25,000, mainly through the efforts of Major Reuben H. Fleet, president. The company, largest builders of commercial and naval flying boats in the world, was organized in 1923 in East Greenwich, Conn., and first operations were carried on in rented space only 100 feet by 150 feet in size.

START IN BUFFALO

First order received was for 50 two-place tandem trainers. Quarters then occupied were too small to permit construction of these ships, so the company moved to Buffalo, N. Y., where 28,000 square feet of space was rented in an empty factory building which contained plenty of additional room for expension. As the company grew, additional space was added, until by February, 1934, plant area covered 197,298 square feet.

During first years of operations, the company devoted much time to the development of large flying boats, one of these early types being the Commodore, the prototype of which was the first monotype flying boat in the world. Fourteen Commodores were built, of which 13 are still flying, one having been burned in a hangar fire.

These first boats were built so strongly that one, having occasion to make a forced landing in Cuba, landed safely without injuring a passenger and was easily repaired.

MOVE TO SAN DIEGO

From the Commodore series was evolved the Navy model P2Y. By 1935 the company's principal business was the building of large flying boats for the U. S. Navy. Testing of these boats at Buffalo was almost impossible during six months of the year, because of ice on Lake Erie, and it was for this reason that Consolidated moved to San Diego. This decision was one of the most important made by company executives.

Southern California weather conditions made year-round testing possible, and at the same time the move gave the company the opportunity to build a modern plant to fit their business, rather than continue to fit their business to existing buildings which prevented economical and fast production.

The first San Diego factory had floor area of 246,841 square feet, and was the newest and most modern airplane plant in existence. Manufacturing operations were started in San Diego in 1936, and during that year the Consolidated Company built and sold $4,085,978 worth of airplanes, as compared to sales of $593,000 just 10 years before.

BIG U. S. CONTRACT

In December of last year the company received a Government contract for $20,016,099 worth of airplanes, a single order larger than total business done by the corporation during the first 12 years of its existence.

Consolidated flying boats have made many extraordinary flights, but to company officials and to the U. S. Navy, they appear on the records as "routine." Among the more spectacular trips have been a number of transcontinental flights, the first of which was by Richard Archbold, from San Diego to New York in a flying boat, 2700 miles in 17 hours, three minutes. Archbold made two later transcontinental flights in Consolidated boats, both being from San Diego to Miami, Fla., 2300 miles non-stop. Other sensational overland flights were made by Commander Andrew Crinkley, who flew a four-engined Consolidated patrol boat from San Diego, via Salt Lake City, to Anacostia Naval Air Station, in 13 hours, then flew back to San Diego via Texas.

Many routine naval flights deserve mention, including a formation flight of 48 boats to Pearl Harbor, Hawaii, 2553 miles in 25 hours; another formation flight of 15 boats to Pearl Harbor in the record time of 16 hours; flights totaling 19,000 miles over the Arctic regions, and a 24,130-mile flight in a twin-engined flying boat from New Guinea to San Diego, by way of Australia, the Indian Ocean, Africa, across the Atlantic, and overland to San Diego.

"EYES OF NAVY"

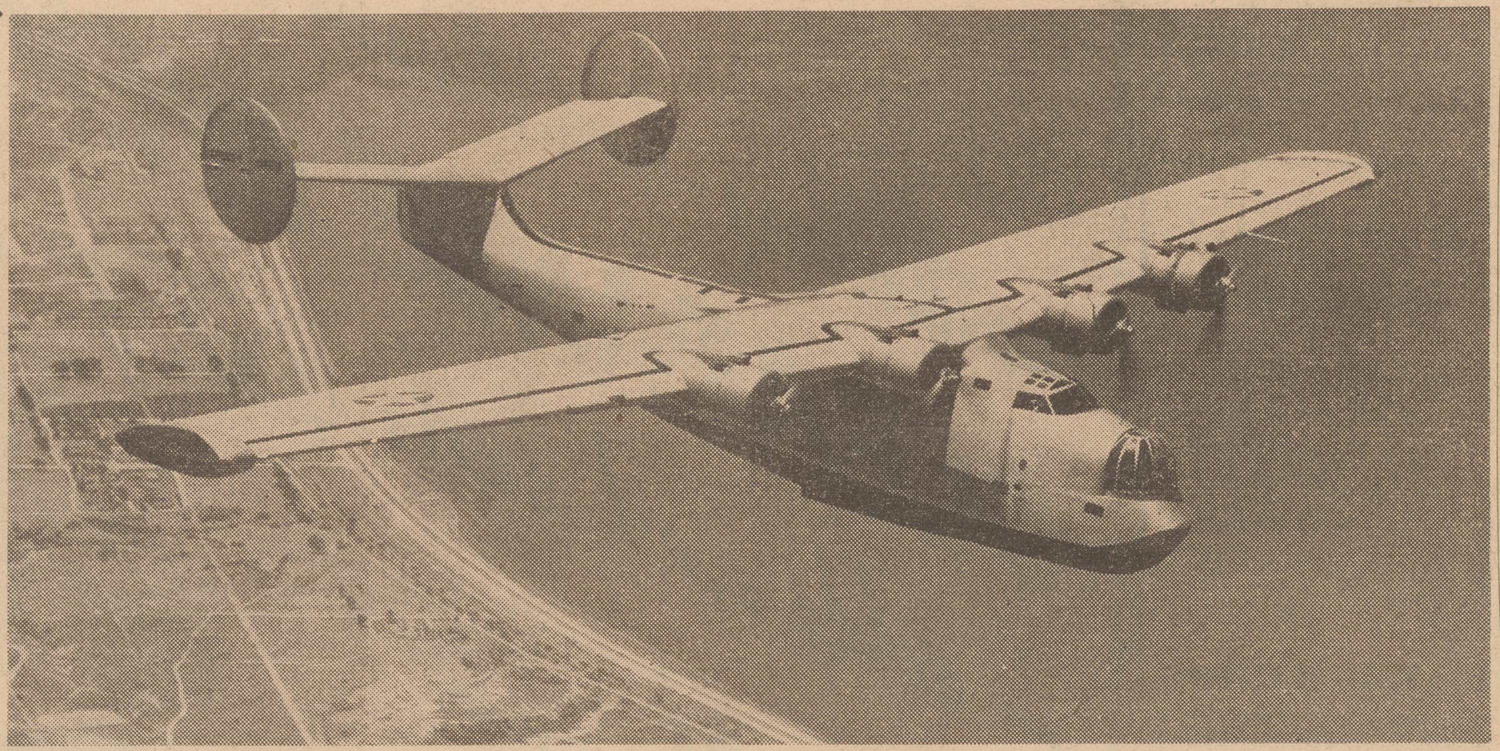
Consolidated flying boats can truthfully be called "the eyes of the Navy" as those now based and in use at various Atlantic and Pacific stations control 60,000,000 square miles of land and sea, an area equal to more than one-third the surface of the earth. These naval patrol boats have flight ranges of 4000 miles, more than sufficient for round-trip, non-stop, flights across the Atlantic. Twin-engined boats have wing spans of 104 feet and weigh 15 tons when fully loaded. Top speed is 199 miles per hour.

The latest consolidated naval flying boat, now in quantity production, is a four-engined ship, specifications of which have not been released by the U. S. Navy. A new commercial model, now being tested at San Diego, but not yet in production, is the first airplane of any kind, land or sea, to be fitted with the new 18-cylinder, 2000 h. p. Wright Cyclone engines.

This two-engined ship has a wing span of only 110 feet, but weighs 50,000 pounds loaded. The hull contains two complete decks with accommodations for 52 passengers for day operations, or sleeping accommodations for 28 persons. Speed is approximately 250 miles per hour.

A new U. S. Air Corps bombardment airplane has recently been put into production, marking Consolidated's first entry into the four-engined bombe field.

Mightiest of Naval Patrol Bombers



4800 HORSEPOWER makes this Consolidated Aircraft model the greatest naval patrol bomber in the air today, experts agree. The XPB2Y shown above the San Diego plant is powered by four twin-row, 14-cylinder motors, and is capable of round trip nonstop flights across the Atlantic with a 5-ton load of bombs. Specifications are kept secret.

BRITISH GET U. S. BOMBERS

Navy News 12/13/40

The first of 26 Consolidated Model 32 4-Engine Land Bombers, which would have become the United States Army's B-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

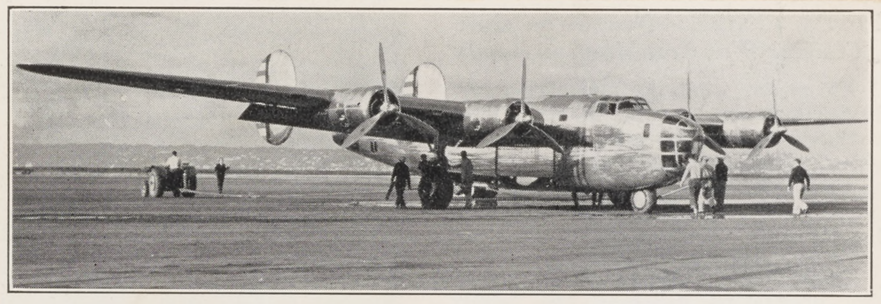
The bombers are similar to the Consolidated prototype Model 32, first flown late in 1939. Incorporated in them are the latest military features designed to meet the combat requirements learned from the present European conflict.

The planes probably exceed 300 miles per hour in speed, have a range of approximately 3,000 miles; and a bomb-carrying capacity of approximately 4 tons.

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear. Fowler flaps aid this high-speed aircraft in take-offs and landings. Their landing gear is of the tricycle type, with single wheel forward.

Approximate dimensions are: wing span—110 feet; fuselage length—64 feet; height—19 feet. The number of the crew varies with the mission to be performed.

THE GOODYEAR NEWS, *June, 1940*

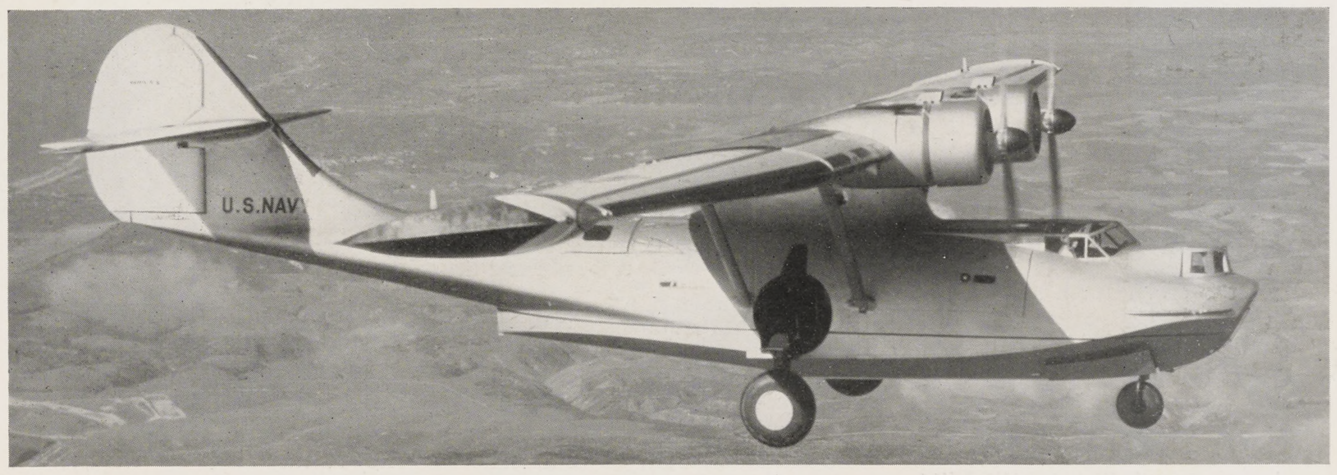


". . . turns tire blowouts . . . into slow leaks . . ."

New Aircraft

INTAVA WORLD March 1940

THE CONSOLIDATED MODEL 28-5A



The Consolidated Model 28-5A twin-engined Amphibian with wheels lowered.

THE Consolidated Aircraft Corpn. has delivered to the U.S. Navy an amphibious version of the well-known Model 28 (Naval PBY Series) flying-boat which is designated the Model 28–5A (XPBY-5A).

The landing gear is of the tricycle type with the main wheels retracting into wells in the sides of the hull and the nose wheel into a compartment in the bow, which is closed by automatically-operated hatches. All three wheels are operated by a central hydraulic drive, the power being derived from the main power-plant or from an auxiliary engine. Emergency hand gear is also provided.

There is no need for a beaching crew as the Model 28–5A can climb a ramp or beach under its own power and can descend in the same manner completely controlled by its brakes.

No special technique is needed for either take-off or return to land or water. The side wheels are above water when the machine rises on its step to take-off and water is automatically ejected from the bow wheel hatch before it is in the air, so that flying trim is not affected. When running up the engine on land the wheels may be locked, elevators pulled hard back and both engines given full take-off throttle without any possibility of the nose wheel rising from the ground. When landing the brakes may be put hard on without any adverse effect. In a side-wind landing the tendency is to straighten out.

AIRFAX

By Derek White

Military activity gets the headlines, but commercial operations forge ahead, and will continue to at increasing speed. More thousands of men are learning to fly than the public realizes. In addition to the 95,000 civilian pilots being trained at Government cost, other thousands are learning at their own expense. One-third of these will buy airplanes . . . Within the next two years 15,000 commercial airplanes will be built and sold, ranging from 40 h. p. light planes to $25,000 luxury ships . . . In addition, 17,000 commercial aircraft engines, 64,000 airplane tires and 22,000,000 gallons of gasoline will be bought by commercial and pleasure flyers.

BITS OF NEWS: General Motors, in addition to other aircraft holdings, will manufacture airplanes under their own name . . . A Dayton aircraft accessory manufacturer will consolidate with a Los Angeles builder of precision parts . . . Don't be surprised if North American gets an order for 500 pursuits . . . Glenn L. Martin earned $4,110,605 last year . . . Stinson Aircraft will move to Nashville, Tenn. . . . Alaskan Airlines transported 4,000,000 pounds of freight, 500,000 pounds of mail and 30,000 passengers during the past 12 months . . . Rearwin Aircraft will enter the light plane market . . . The new mystery Douglas bomber, with 220-foot wing span, will be tested within 30 days . . . First Los Angeles-built light plane will be marketed by Interstate Aircraft and Engineering under another name.

A FEW FIGURES: Total plant area of all U. S. airplane and engine factories is 12,250,000 square feet. Total number of employees now engaged in building planes and motors is 105,000. With present plants and personnel it would take three years to build the airplanes now on order by the Allies, but delivery by July of 1941 is specified . . . Germany now is said to have an air force of 31,000 planes; England 15,000 and France 6000. Of these, one-half are bombing and combat ships, the balance transport, reserve and training models . . . In other words 25,000 ships, on both sides in the present war, are available for fighting. With total war, 30 per cent will be destroyed per month, according to favored military estimates. One authority has estimated destruction at 55 per cent per month. The lower estimate means destruction of 96,000 ships per year . . . With present plants and personnel working day and night, France, England and the United States can produce 30,000 airplanes per year . . . Where will the other 60,000 come from?

THE ANSWER: One year from today airplane and engine plants in the U. S. will cover 25,000,000 square feet; total number of aircraft workers will be 250,000. Any aircraft executive knows this, but few will admit it if you ask.

SWIFT AND SURE: During a recent 60-day period this writer flew more than 9000 miles, mostly at night, which is farther than his father travelled in his entire life . . . More men are flying now because wives have been convinced that flying is safe . . . Airlines have completed 13 consecutive months of flying without a single accident. Even the 1938 record of five accidents, made flying safer than staying at home, because during the past five years accidents in homes killed 167,000 persons.

TRENDS TODAY: First three-wheeled landing gears were adopted in 1910, later abandoned, and are now almost standard on newest planes . . . First successful planes used pusher propellers, which are more efficient. They were abandoned for tractor propellers in 1915. New Bell twin-engined Airacuda has pusher propellers. You will see more in the future . . . First aircraft engines were liquid cooled, then abandoned for air-cooled motors. Most powerful engine today is the Allison, which is liquid cooled. The first manufacturer who brings out a reliable, low-priced liquid-cooled aircraft engine in the 150 to 200 h. p. class will skim the cream of the motor business and make a fortune.

AIRPLANE COSTS: How much does it cost to produce a new type airplane? Most costly was Douglas DC4 which cost $1,800,000 and required nearly three years for engineering and building. First Boeing Flying Fortress was designed and built in six months at cost of $500,000. A single-engined attack-bomber cost $175,000 for engineering and construction; another of the same size and approximate speed was engineered and built for $22,000. The cost of a new type seems to depend upon the amount of money available and the men responsible.

SEEN HERE AND THERE: Claude Ryan, head of Ryan Aeronautical Company, in Los Angeles on business . . . Jack West, who writes more aero advertising than any other Los Angeles man, out after a new account . . . Hal Curtis, best informed man in America on stainless steel aircraft construction . . . Leroy Prinz, Hollywood director, who will go on the board of a Los Angeles Aircraft Company . . . Norman Davidson, assistant to E. N. Gott, vice president of Consolidated Aircraft, who would not admit that his company is on the verge of a large bomber contract . . . Ben O. Howard, air-racer and manufacturer, talking about a proposed air freight line . . . Harvey Martin, airplane distributor, who has bought the factory building of American Aircraft, in which he will open a school on June 1 . . B. L. Ball, financier, who may back both an aircraft manufacturing company and an airline.

Sunday april 28th 1940.

Recorders Group Picks Officers

State Association Meets Next Year at San Jose

Ending their three-day annual convention at the Biltmore the County Recorders' Association of California yesterday chose Ralph Cunningham of Martinez as their new president and San Jose as their 1941 meeting place.

Others elected were Charles A. Payne of San Jose, first vice president; Roger N. Howe, San Diego, second vice president, and Mrs. Verda Smith Roberts, Quincy, secretary-treasurer.

Next year's meeting will be held some time in February, the exact date to be determined later.

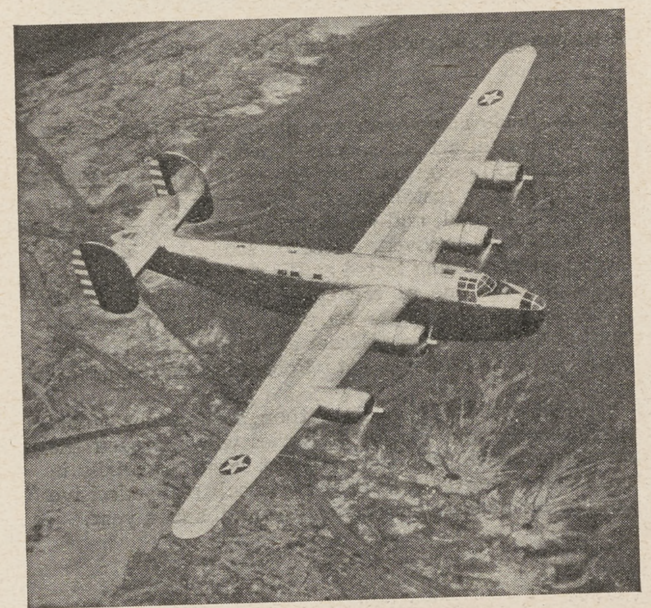
Deliveries of the Consolidated PBY will begin about the end of the year.



The Consolidated B-24s are not due until 1941.

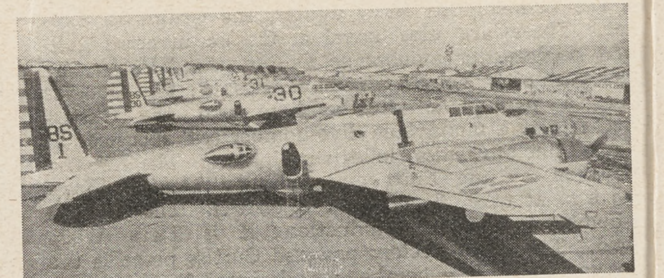
purchaser and Sweden is scared of Berlin. After all, Nazi-occupied Norway does lie between Britain and Sweden. The planes will probably be turned back to the manufacturer, who will then sell them to Canada or England, anyway. The Wasp-powered Vanguard is in the same class as the P-36, the Grumman and the Brewster.

Lockheed is currently delivering at a 30-to-40-a-month rate an improved version of the Hudson bomber. The new type, somewhat larger, is derived from the Lockheed Lodestar transport in the same way the Hudson comes from the 14. The Lodestar's top speed is about 265 miles an hour. The current improved Hudson order calls for 250 planes altogether.

Delivery of Consolidated PBY twin-engined flying boats, similar to the 28-5 bought by the Air Ministry last year for test purposes, will begin about the end of the year. A very large number of these is on order.

The Purchasing Commission took over a French order for 120 Consolidated B-24 four-motored bombers, but they are not due until 1941. A couple of minor hitches have developed in connection with the large high-winged Consolidated—which has the thin-section, narrow-chord Davis wing—and may have been responsible for some delay. As designed originally for the U.S. Army Air Corps, it involved three different types of power-driven turrets developed by the General Electric Company and Martin. The commission balked at this pointless variety. (Yes, the United States is getting around to power turrets at last. Army officials are reported here to be considering a British offer of manufacturing rights on the Boulton-Paul turret, as well as sponsoring development of American types.)

Deliveries of Douglas and Martin attack bombers are running to 15 to 20 a month each, and should increase rapidly in the near future. Three slightly different planes are involved in the Douglas orders: 270 Douglas B-7s (two Twin Wasps, 320 m.p.h.), all delivered to France and the order completed; 100 D-B7As, the same plane with G-1200 Cyclones and a little better performance, ordered by France, but now in process of delivery to the R.A.F.; and the D-B7B. The last is an export version of the Army's A-20 light bomber, minus the new General Electric exhaust-driven turbo-supercharger. The DB7B will have a top speed of 350 miles an hour. (The turbo-supercharged Army plane is supposed to reach 390 miles an hour at 25,000ft.) Nearly 1,000 DB7Bs are on order. About one-third are to be built by the Boeing Aircraft Company under licence. Deliveries of DB7Bs, as well as of Boeing Flying Fortresses, also ordered by the Commission, are not due for some months.



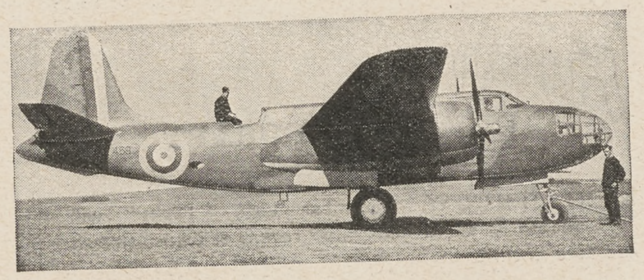
New armament will, presumably, be fitted in the Boeing "Flying Fortress." This picture shows the original American version.

Despite the criticism of the Bell P-39 or Airacobra, the rear-engined tractor single-seater, in *Flight*, and the mechanical difficulties that plague it in the United States, a large order for this model was placed three months ago by the commission.

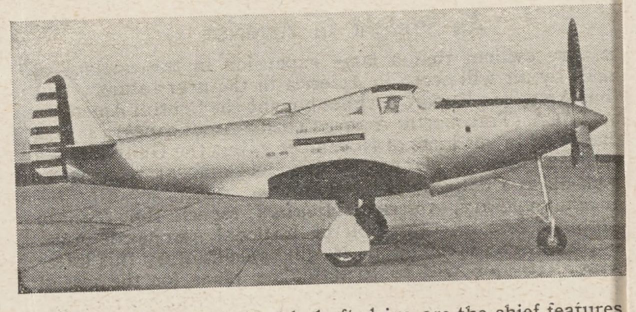
Deliveries of this will be slow, and for a reason that affects other planes on order as well. The Allison Engineering Company is still beset by the difficulties which have delayed the start of quantity production of the Allison V-170 engine for more than a year.

Dozens of Curtiss P-40 Tomahawks, built both for the R.A.F. and the Army Air Corps, are sitting idle in the Curtiss Buffalo plant, waiting for the engines which come slowly when they come at all.

September production of P-40s, for both customers, is supposed to reach 170. But, in the first ten days of the month, deliveries were at least 75 per cent. below the quota. Although the Curtiss single-seater has been on order for the Army since last fall, so far the Army has been able to equip only three squadrons with the machine



Boston is the British name for the Douglas DB-7. Like the fighter on the right, it is equipped with tricycle undercarriage.



Tricycle undercarriage and shaft drive are the chief features of the Bell Airacobra.

ITALY AS A TARGET (CONTINUED)

racks, close to the grounds of the Villa Cavoia, and easily orientated by a bend in the river and the racecourse of the Villa Glori. Is this barracks empty?

Rome was one of the four Italian mainland zones for air organisation. Has this centralisation of air-zone organisation been removed from Rome?

About Rome lie a number of aerodromes. There are the military aerodromes of Centocelle and Ciampino-Nord, and the military seaplane station of Ostia, near the mouth of the river. There are the civil airports of Littorio for landplanes and Lido di Roma for seaplanes. Are they still used for civil aircraft? If not, what are they used for? Not far out from Rome is the experimental and military aerodrome of Montecelio. Alongside it is Italy's Farnborough—the laboratory aeronautical establishment of Guidonia—standing beautifully situated in the shadow of the Appenines.

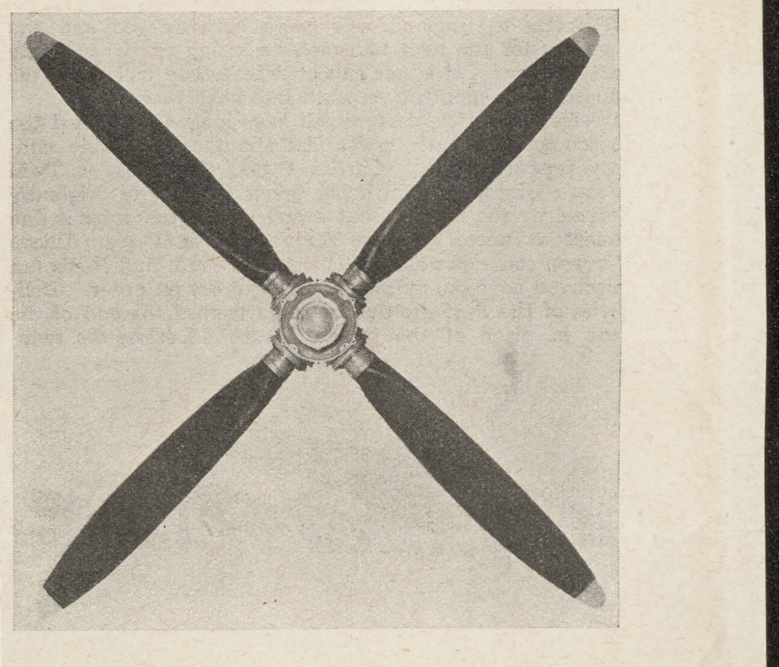
It is incredible that these aerodromes can be unused. They must play a part, and a not unimportant part, in the Italian air-war effort. Bombing these aerodromes would not be bombing Rome, but the noise of an attack with heavy bombs against these aerodromes would be heard in Rome. It would give the Roman citizen the knowledge that the Royal Air Force were in proximity to his city. That fact might hasten the Italian Government in reaching a decision in regard to a convention defining zones scheduled as immune from bombing.

Rome lies 860 miles from the nearest part of the English coast. That is a long way to carry the heaviest calibre bombs. But Rome lies at the southern end of the three zones into which I divided Italy for target purposes in the article which appeared in *Flight* last week. And that brings Rome and its environs within comfortable striking range of aircraft based on Greek territory. It is 510 miles from one Greek aerodrome, which is not even the most advanced aerodrome on Greek soil. That makes attack on Rome relatively easy. That possibility is one part of the price which Mussolini must have considered (surely with his wisdom?) when he sanctioned or ordered the attack on Greece.

It may be that we have to consider Athens, and the risk of reprisals against the Greek capital, in regard to any attack on Rome. But already the Italians have attacked Tatoi, the Athenian military aerodrome. That allows us to attack the aerodromes around Rome, surely? And as I have endeavoured to show, there are other military targets within Rome itself, unless they have been all evacuated. Surely we ought to seek first to demand that there shall be scheduled zones, for Britain and Italy; but if we cannot reach agreement, how can the Italians expect us to respect their ancient monuments when they have no regard for ours?

FOR GREATER EFFICIENCY

New Rotol Four-bladed Airscrew Introduced : 35-deg. or Feathering



In the early days of flying the four-bladed airscrew was a fairly common sight, especially on those aeroplanes fitted with engines that had reduction gears. On the direct-drive engines the two-blader was the usual airscrew. The reason for the four-blader was that better efficiency could be obtained with a smaller diameter, and, as undercarriages were fixed in those days, aircraft designers were helped by the four-blader to the extent that a lower undercarriage could be used, thus saving a certain amount of drag.

It might have been thought that in modern times, with retractable undercarriages almost universal, there would not be the same need for four-bladed airscrews. Actually there is, but for rather different reasons. The power of engines has gone up a great deal, and promise to increase still further. The problem of absorbing efficiently the extra power is a very real one. It can be done by increasing the diameter and the blade width, but a limit is set to this line of development by the question of tip speeds. Consequently there is good reason for the four-bladed airscrew for modern high-power engines.

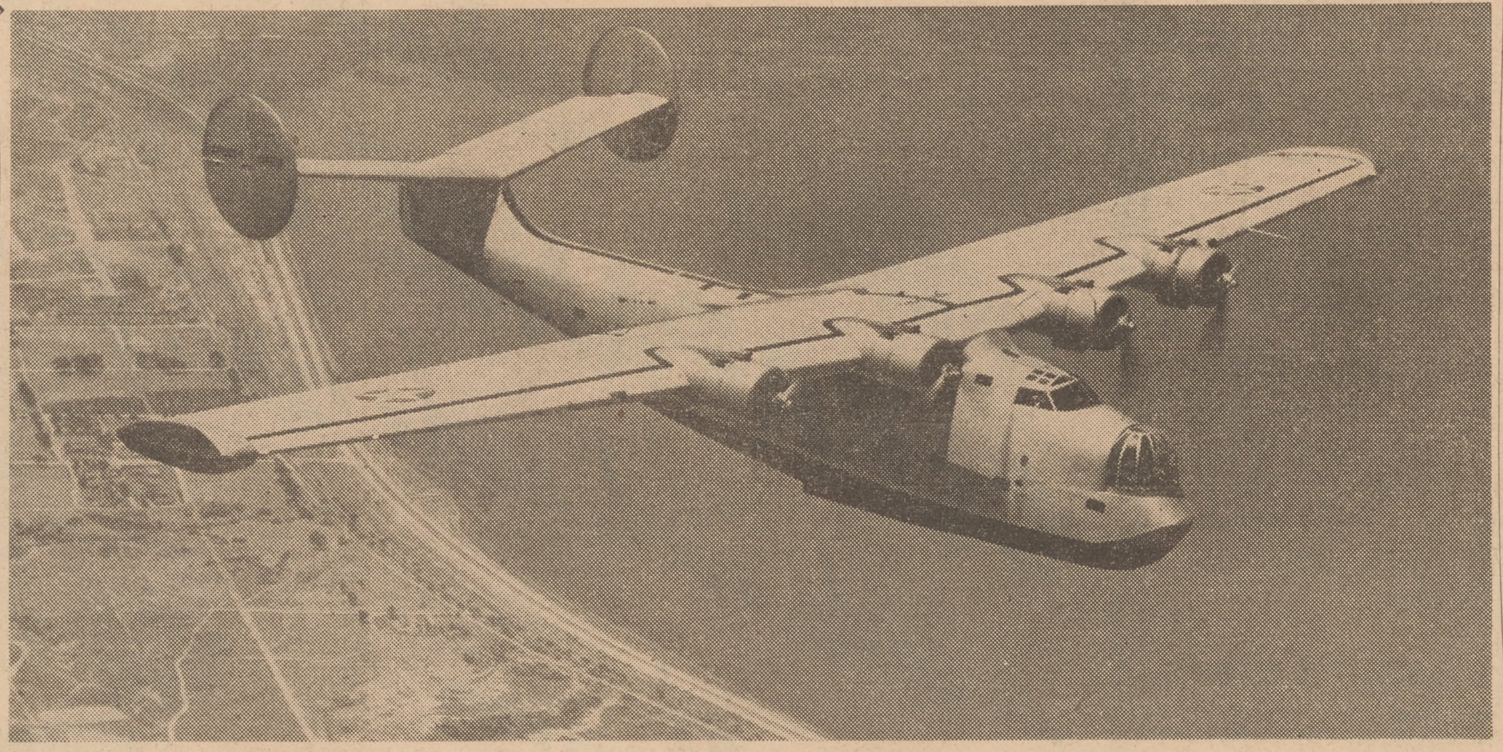
Rotol Airscrews, Ltd., is the first British firm to introduce a variable-pitch airscrew of modern design. In design and operating principle the new four-blader is similar to the well-known Rotol three-bladed airscrews of the 35 deg. and feathering series. That is to say, the pitch of the blades is changed by means of a double-acting cylinder mechanism located externally on the front of the hub. The operation is governed by a constant-speed unit which takes its oil and drive from the engine. This unit is sensitive to variations in engine r.p.m., and, by means of a balance-weight governor and a specially-designed piston valve, controls the flow of boosted pressure oil to the cylinder which moves over a stationary piston.

The blades of the new Rotol may be of improved wood, or of light alloy. The hub is designed on the same lines as that of the three-blader. The blades are mounted in a double-row thrust ball bearing, and pre-load is applied through an additional row of balls, the race of which is integral with the upper thrust race. This arrangement differs from that of the Rotol three-blader, in which the blades are borne in four-race stacks.

A pitch-angle range of 35 deg. is obtainable, the makers contending that this is sufficient for the fastest fighter, i.e., for the aircraft with the widest speed range. A long-stroke cylinder is, however, available, which will give any desired angle, up to feathering. At present a range of 35 deg. from the fine-pitch setting has been found sufficient to prevent "over-revving" in the fastest dive, during which the blade angle will steadily grow coarser to keep the engine speed at its predetermined lever setting

Flying Boat Plants Adding 100 Employees Each Week

Mightiest of Naval Patrol Bombers



4800 HORSEPOWER makes this Consolidated Aircraft model the greatest naval patrol bomber in the air today, experts agree. The XPB2Y shown above the San Diego plant is powered by four twin-row, 14-cylinder motors, and is capable of round trip nonstop flights across the Atlantic with a 5-ton load of bombs. Specifications are kept secret.

Total of 10,000 Expected at Consolidated

By Derek White

Just 40 minutes by air south of Los Angeles, on San Diego Bay, is the plant of the Consolidated Aircraft Corporation, builders of giant Naval Patrol flying boats. The company is now engaged in an expansion to end all expansions, in expectation of additional orders which will dwarf their present backlog of more than $50,000,000.

Present plant area is 447,332 square feet. This is being increased by 87 per cent, which will bring total floor area to 843,332 square feet. Approximately 5000 employees are now on the payroll, but men are being added at the rate of more than 100 per week so that when the new plant is completed, employees will total 7500. Approximately 10,000 men will be employed by the end of this year.

Consolidated Aircraft has been built for an initial capital of only $25,000, mainly through the efforts of Major Reuben H. Fleet, president. The company, largest builders of commercial and naval flying boats in the world, was organized in 1923 in East Greenwich, Conn., and first operations were carried on in rented space only 100 feet by 150 feet in size.

START IN BUFFALO

First order received was for 50 two-place tandem trainers. Quarters then occupied were too small to permit construction of these ships, so the company moved to Buffalo, N. Y., where 28,000 square feet of space was rented in an empty factory building which contained plenty of additional room for expension. As the company grew, additional space was added, until by February, 1934, plant area covered 197,298 square feet.

During first years of operations, the company devoted much time to the development of large flying boats, one of these early types being the Commodore, the prototype of which was the first monotype flying boat in the world. Fourteen Commodores were built, of which 13 are still flying, one having been burned in a hangar fire.

These first boats were built so strongly that one, having occasion to make a forced landing in Cuba, landed safely without injuring a passenger and was easily repaired.

MOVE TO SAN DIEGO

From the Commodore series was evolved the Navy model P2Y. By 1935 the company's principal business was the building of large flying boats for the U. S. Navy. Testing of these boats at Buffalo was almost impossible during six months of the year, because of ice on Lake Erie, and it was for this reason that Consolidated moved to San Diego. This decision was one of the most important made by company executives.

Southern California weather conditions made year-round testing possible, and at the same time the move gave the company the opportunity to build a modern plant to fit their business, rather than continue to fit their business to existing buildings which prevented economical and fast production.

The first San Diego factory had floor area of 246,841 square feet, and was the newest and most modern airplane plant in existence. Manufacturing operations were started in San Diego in 1936, and during that year the Consolidated Company built and sold $4,085,978 worth of airplanes, as compared to sales of $593,000 just 10 years before.

BIG U. S. CONTRACT

In December of last year the company received a Government contract for $20,016,099 worth of airplanes, a single order larger than total business done by the corporation during the first 12 years of its existence.

Consolidated flying boats have made many extraordinary flights, but to company officials and to the U. S. Navy, they appear on the records as "routine." Among the more spectacular trips have been a number of transcontinental flights, the first of which was by Richard Archbold, from San Diego to New York in a flying boat, 2700 miles in 17 hours, three minutes. Archbold made two later transcontinental flights in Consolidated boats, both being from San Diego to Miami, Fla., 2300 miles non-stop. Other sensational overland flights were made by Commander Andrew Crinkley, who flew a four-engined Consolidated patrol boat from San Diego, via Salt Lake City, to Anacostia Naval Air Station, in 13 hours, then flew back to San Diego via Texas.

Many routine naval flights deserve mention, including a formation flight of 48 boats to Pearl Harbor, Hawaii, 2553 miles in 25 hours; another formation flight of 15 boats to Pearl Harbor in the record time of 16 hours; flights totaling 19,000 miles over the Arctic regions, and a 24,130-mile flight in a twin-engined flying boat from New Guinea to San Diego, by way of Australia, the Indian Ocean, Africa, across the Atlantic, and overland to San Diego.

"EYES OF NAVY"

Consolidated flying boats can truthfully be called "the eyes of the Navy" as those now based and in use at various Atlantic and Pacific stations control 60,000,000 square miles of land and sea, an area equal to more than one-third the surface of the earth. These naval patrol boats have flight ranges of 4000 miles, more than sufficient for round-trip, non-stop, flights across the Atlantic. Twin-engined boats have wing spans of 104 feet and weigh 15 tons when fully loaded. Top speed is 199 miles per hour.

The latest consolidated naval flying boat, now in quantity production, is a four-engined ship, specifications of which have not been released by the U. S. Navy. A new commercial model, now being tested at San Diego, but not yet in production, is the first airplane of any kind, land or sea, to be fitted with the new 18-cylinder, 2000 h. p. Wright Cyclone engines.

This two-engined ship has a wing span of only 110 feet, but weighs 50,000 pounds loaded. The hull contains two complete decks with accommodations for 52 passengers for day operations, or sleeping accommodations for 28 persons. Speed is approximately 250 miles per hour.

A new U. S. Air Corps bombardment airplane has recently been put into production, marking Consolidated's first entry into the four-engined bombe field.

BRITISH GET U. S. BOMBERS

Navy News 12/13/40

The first of 26 Consolidated Model 32 4-Engine Land Bombers, which would have become the United States Army's B-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

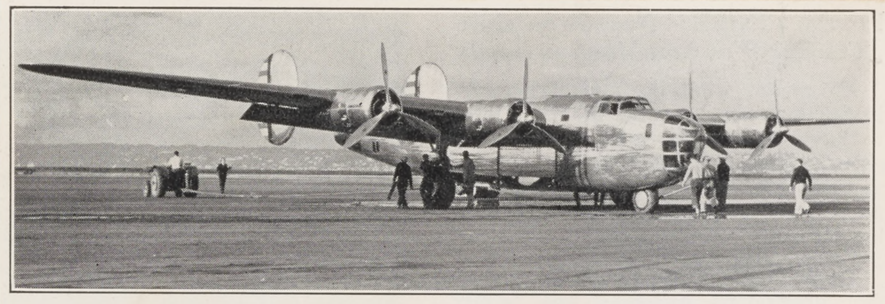
The bombers are similar to the Consolidated prototype Model 32, first flown late in 1939. Incorporated in them are the latest military features designed to meet the combat requirements learned from the present European conflict.

The planes probably exceed 300 miles per hour in speed, have a range of approximately 3,000 miles; and a bomb-carrying capacity of approximately 4 tons.

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear. Fowler flaps aid this high-speed aircraft in take-offs and landings. Their landing gear is of the tricycle type, with single wheel forward.

Approximate dimensions are: wing span—110 feet; fuselage length—64 feet; height—19 feet. The number of the crew varies with the mission to be performed.

The Goodyear News, *June, 1940*

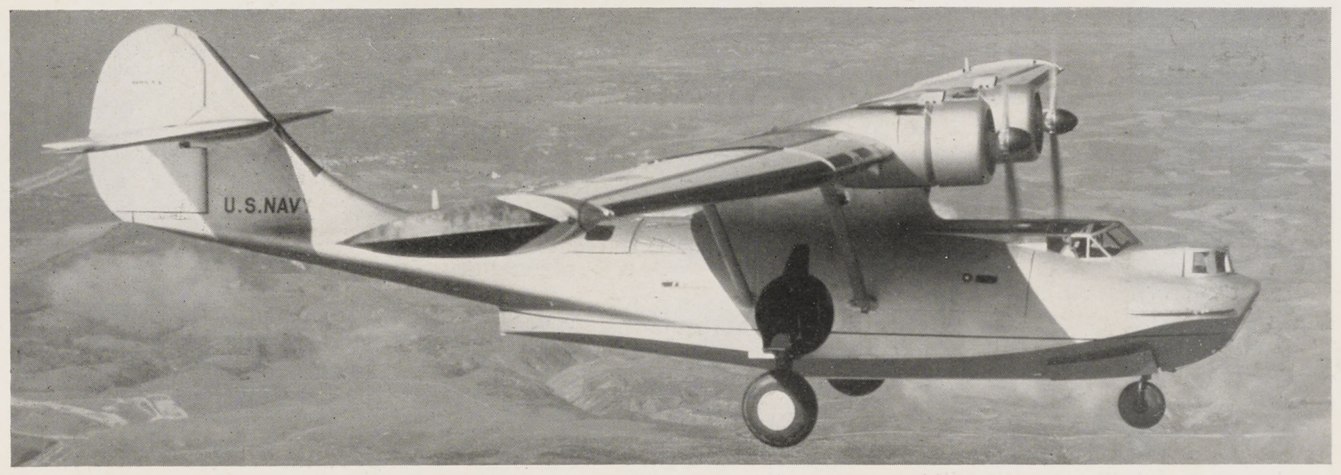


"... turns tire blowouts ... into slow leaks ..."

New Aircraft

INTAVA WORLD March 1940

THE CONSOLIDATED MODEL 28-5A



The Consolidated Model 28-5A twin-engined Amphibian with wheels lowered.

THE Consolidated Aircraft Corpn. has delivered to the U.S. Navy an amphibious version of the well-known Model 28 (Naval PBY Series) flying-boat which is designated the Model 28–5A (XPBY-5A).

The landing gear is of the tricycle type with the main wheels retracting into wells in the sides of the hull and the nose wheel into a compartment in the bow, which is closed by automatically-operated hatches. All three wheels are operated by a central hydraulic drive, the power being derived from the main power-plant or from an auxiliary engine. Emergency hand gear is also provided.

There is no need for a beaching crew as the Model 28–5A can climb a ramp or beach under its own power and can descend in the same manner completely controlled by its brakes.

No special technique is needed for either take-off or return to land or water. The side wheels are above water when the machine rises on its step to take-off and water is automatically ejected from the bow wheel hatch before it is in the air, so that flying trim is not affected. When running up the engine on land the wheels may be locked, elevators pulled hard back and both engines given full take-off throttle without any possibility of the nose wheel rising from the ground. When landing the brakes may be put hard on without any adverse effect. In a side-wind landing the tendency is to straighten out.

Sunday April 28th 1940.

AIRFAX

By Derek White

Military activity gets the headlines, but commercial operations forge ahead, and will continue to at increasing speed. More thousands of men are learning to fly than the public realizes. In addition to the 95,000 civilian pilots being trained at Government cost, other thousands are learning at their own expense. One-third of these will buy airplanes . . . Within the next two years 15,000 commercial airplanes will be built and sold, ranging from 40 h. p. light planes to $25,000 luxury ships . . . In addition, 17,000 commercial aircraft engines, 64,000 airplane tires and 22,000,000 gallons of gasoline will be bought by commercial and pleasure flyers.

BITS OF NEWS: General Motors, in addition to other aircraft holdings, will manufacture airplanes under their own name . . . A Dayton aircraft accessory manufacturer will consolidate with a Los Angeles builder of precision parts . . . Don't be surprised if North American gets an order for 500 pursuits . . . Glenn L. Martin earned $4,110,605 last year . . . Stinson Aircraft will move to Nashville, Tenn. . . . Alaskan Airlines transported 4,000,000 pounds of freight, 500,000 pounds of mail and 30,000 passengers during the past 12 months . . . Rearwin Aircraft will enter the light plane market . . . The new mystery Douglas bomber, with 220-foot wing span, will be tested within 30 days . . . First Los Angeles-built light plane will be marketed by Interstate Aircraft and Engineering under another name.

A FEW FIGURES: Total plant area of all U. S. airplane and engine factories is 12,250,000 square feet. Total number of employees now engaged in building planes and motors is 105,000. With present plants and personnel it would take three years to build the airplanes now on order by the Allies, but delivery by July of 1941 is specified . . . Germany now is said to have an air force of 31,000 planes; England 15,000 and France 6000. Of these, one-half are bombing and combat ships, the balance transport, reserve and training models . . . In other words 25,000 ships, on both sides in the present war, are available for fighting. With total war, 30 per cent will be destroyed per month, according to favored military estimates. One authority has estimated destruction at 55 per cent per month. The lower estimate means destruction of 96,000 ships per year . . . With present plants and personnel working day and night, France, England and the United States can produce 30,000 airplanes per year . . . Where will the other 60,000 come from?

THE ANSWER: One year from today airplane and engine plants in the U. S. will cover 25,000,000 square feet; total number of aircraft workers will be 250,000. Any aircraft executive knows this, but few will admit it if you ask.

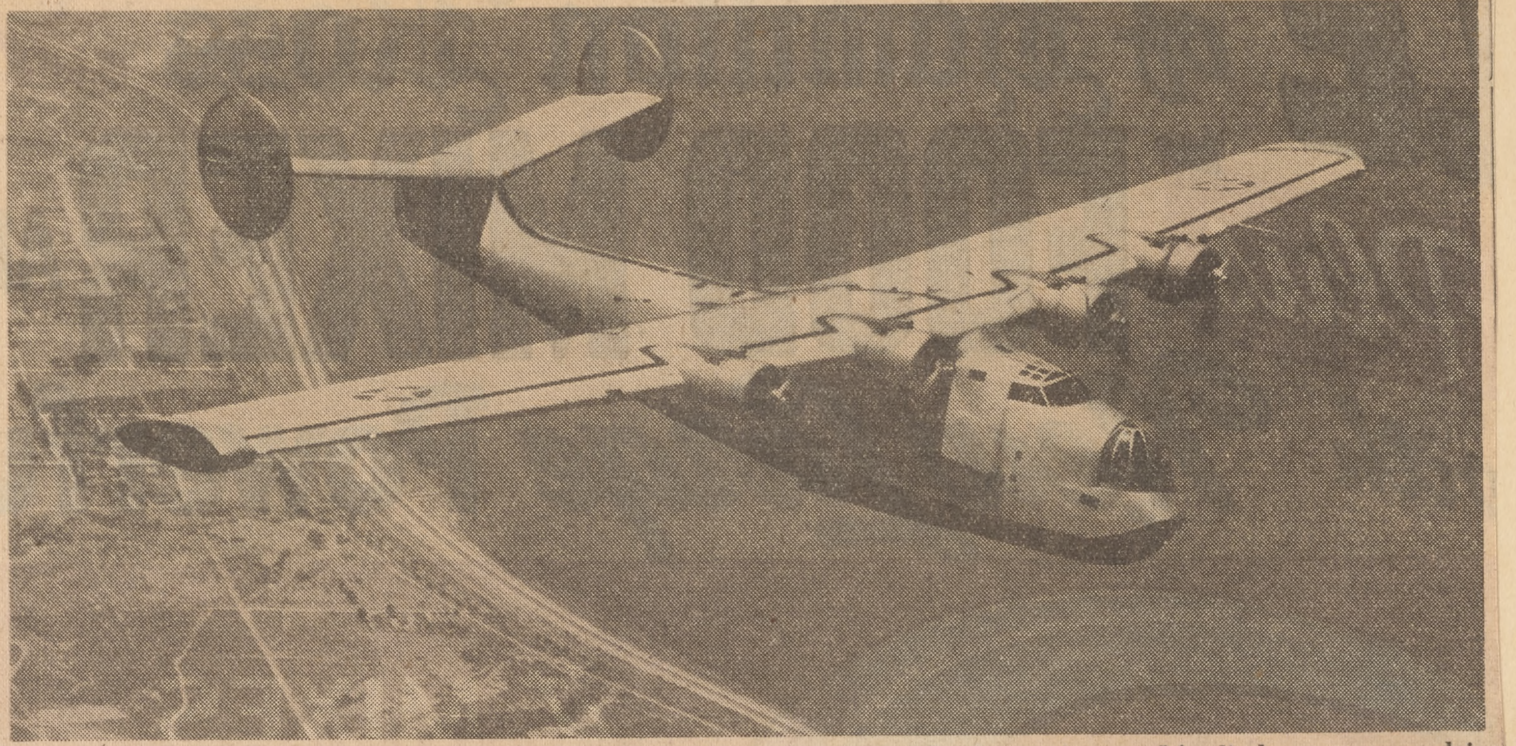
SWIFT AND SURE: During a recent 60-day period this writer flew more than 9000 miles, mostly at night, which is farther than his father travelled in his entire life . . . More men are flying now because wives have been convinced that flying is safe . . . Airlines have completed 13 consecutive months of flying without a single accident. Even the 1938 record of five accidents, made flying safer than staying at home, because during the past five years accidents in homes killed 167,000 persons.

TRENDS TODAY: First three-wheeled landing gears were adopted in 1910, later abandoned, and are now almost standard on newest planes . . . First successful planes used pusher propellers, which are more efficient. They were abandoned for tractor propellers in 1915. New Bell twin-engined Airacuda has pusher propellers. You will see more in the future . . . First aircraft engines were liquid cooled, then abandoned for air-cooled motors. Most powerful engine today is the Allison, which is liquid cooled. The first manufacturer who brings out a reliable, low-priced liquid-cooled aircraft engine in the 150 to 200 h. p. class will skim the cream of the motor business and make a fortune.

AIRPLANE COSTS: How much does it cost to produce a new type airplane? Most costly was Douglas DC4 which cost $1,800,000 and required nearly three years for engineering and building. First Boeing Flying Fortress was designed and built in six months at cost of $500,000. A single-engined attack-bomber cost $175,000 for engineering and construction; another of the same size and approximate speed was engineered and built for $22,000. The cost of a new type seems to depend upon the amount of money available and the men responsible.

SEEN HERE AND THERE: Claude Ryan, head of Ryan Aeronautical Company, in Los Angeles on business . . . Jack West, who writes more aero advertising than any other Los Angeles man, out after a new account . . . Hal Curtis, best informed man in America on stainless steel aircraft construction . . . Leroy Prinz, Hollywood director, who will go on the board of a Los Angeles Aircraft Company . . . Norman Davidson, assistant to E. N. Gott, vice president of Consolidated Aircraft, who would not admit that his company is on the verge of a large bomber contract . . . Ben O. Howard, air-racer and manufacturer, talking about a proposed air freight line . . . Harvey Martin, airplane distributor, who has bought the factory building of American Aircraft, in which he will open a school on June 1 . . B. L. Ball, financier, who may back both an aircraft manufacturing company and an airline.

Aircraft Plant Adds 100 Workers Weekly



4800 HORSEPOWER makes this Consolidated Aircraft model the greatest naval patrol bomber in the air today, experts agree. The XPB2Y shown above the San Diego plant is powered by four twin-row, 14-cylinder motors, and is capable of round trip nonstop flights across the Atlantic with a 5-ton load of bombs. Specifications are kept secret.

Recorders Group Picks Officers

State Association Meets Next Year at San Jose

Ending their three-day annual convention at the Biltmore the County Recorders' Association of California yesterday chose Ralph Cunningham of Martinez as their new president and San Jose as their 1941 meeting place.

Others elected were Charles A. Payne of San Jose, first vice president; Roger N. Howe, San Diego, second vice president, and Mrs. Verda Smith Roberts, Quincy, secretary-treasurer.

Next year's meeting will be held some time in February, the exact date to be determined later.

Flying Boat Company Plans 10,000 Employees by End of Year

By Derek White

Just 40 minutes by air south of Los Angeles, on San Diego Bay, is the plant of the Consolidated Aircraft Corporation, builders of giant Naval Patrol flying boats. The company is now engaged in an expansion to end all expansions, in expectation of additional orders which will dwarf their present backlog of more than $50,000,000.

Present plant area is 447,332 square feet. This is being increased by 87 per cent, which will bring total floor area to 843,332 square feet. Approximately 5000 employees are now on the payroll, but men are being added at the rate of more than 100 per week so that when the new plant is completed, employees will total 7500. Approximately 10,000 men will be employed by the end of this year.

Consolidated Aircraft has been built for an initial capital of only $25,000, mainly through the efforts of Major Reuben H. Fleet, president. The company, largest builders of commercial and naval flying boats in the world, was organized in 1923 in East Greenwich, Conn., and first operations were carried on in rented space only 100 feet by 150 feet in size.

START IN BUFFALO

First order received was for 50 two-place tandem trainers. Quarters then occupied were too small to permit construction of these ships, so the company moved to Buffalo, N. Y., where 28,000 square feet of space was rented in an empty factory building which contained plenty of additional room for expension. As the company grew, additional space was added, until by February, 1934, plant area covered 197,298 square feet.

During first years of operations, the company devoted much time to the development of large flying boats, one of these early types being the Commodore, the prototype of which was the first monotype flying boat in the world. Fourteen Commodores were built, of which 13 are still flying, one having been burned in a hangar fire.

These first boats were built so strongly that one, having occasion to make a forced landing in Cuba, landed safely without injuring a passenger and was easily repaired.

From the Commodore series was evolved the Navy model P2Y. By 1935 the company's principal business was the building of large flying boats for the U. S. Navy. Testing of these boats at Buffalo was almost impossible during six months of the year, because of ice on Lake Erie, and it was for this reason that Consolidated moved to San Diego. This decision was one of the most important made by company executives.

Southern California weather conditions made year-round testing possible, and at the same time the move gave the company the opportunity to build a modern plant to fit their business, rather than continue to fit their business to existing buildings which prevented economical and fast production.

The first San Diego factory had floor area of 246,841 square feet, and was the newest and most modern airplane plant in existence. Manufacturing operations were started in San Diego in 1936, and during that year the Consolidated Company built and sold $4,085,978 worth of airplanes, as compared to sales of $593,000 just 10 years before.

In December of last year the company received a Government contract for $20,016,099 worth of airplanes, a single order larger than total business done by the corporation during the first 12 years of its existence.

Consolidated flying boats have made many extraordinary flights, but to company officials and to the U. S. Navy, they appear on the records as "routine." Among the more spectacular trips have been a number of transcontinental flights, the first of which was by Richard Archbold, from San Diego to New York in a flying boat, 2700 miles in 17 hours, three minutes. Archbold made two later transcontinental flights in Consolidated boats, both being from San Diego to Miami, Fla., 2300 miles non-stop. Other sensational overland flights were made by Commander Andrew Crinkley, who flew a four-engined Consolidated patrol boat from San Diego, via Salt Lake City, to Anacostia Naval Air Station, in 13 hours, then flew back to San Diego via Texas.

Many routine naval flights deserve mention, including a formation flight of 48 boats to Pearl Harbor, Hawaii, 2553 miles in 25 hours; another formation flight of 15 boats to Pearl Harbor in the record time of 16 hours; flights totaling 19,000 miles over the Arctic regions, and a 24,130-mile flight in a twin-engined flying boat from New Guinea to San Diego, by way of Australia, the Indian Ocean, Africa, across the Atlantic, and overland to San Diego.

Consolidated flying boats can truthfully be called "the eyes of the Navy" as those now based and in use at various Atlantic and Pacific stations control 60,000,000 square miles of land and sea, an area equal to more than one-third the surface of the earth. These naval patrol boats have flight ranges of 4000 miles, more than sufficient for round-trip, non-stop, flights across the Atlantic. Twin-engined boats have wing spans of 104 feet and weigh 15 tons when fully loaded. Top speed is 199 miles per hour.

The latest consolidated naval flying boat, now in quantity production, is a four-engined ship, specifications of which have not been released by the U. S. Navy. A new commercial model, now being tested at San Diego, but not yet in production, is the first airplane of any kind, land or sea, to be fitted with the new 18-cylinder, 2000 h. p. Wright Cyclone engines.

This two-engined ship has a wing span of only 110 feet, but weighs 50,000 pounds loaded. The hull contains two complete decks with accommodations for 52 passengers for day operations, or sleeping accommodations for 28 persons. Speed is approximately 250 miles per hour.

A new U. S. Air Corps bombardment airplane has recently been put into production, marking Consolidated's first entry into the four-engined bomber field.

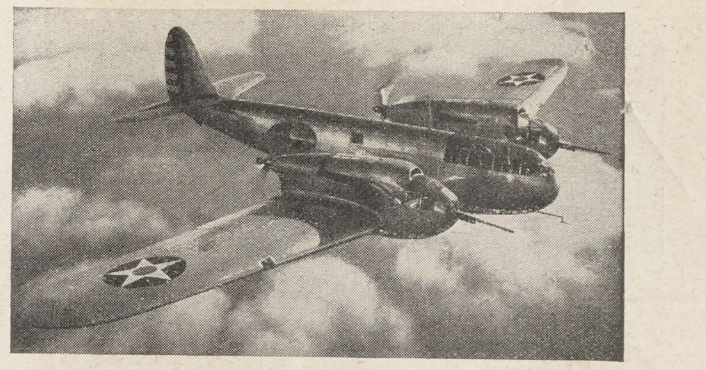
ALF OF EVERYTHING (CONTINUED)

On top of that, production model Allisons are not turn-
g up the designed power, which is 1,000 h.p. for take-
f. It delivers about 100 horse-power less. The designed
eed of the P-40, with the Allison expected to turn out
e thousand horse, is 360 m.p.h. The plane's partisans
aim it reaches 330. Army pilots who have flown it say
is hardly faster than the P-36.

These same difficulties apply, of course, to the Lockheed
38 and the Bell Airacobra. I suppose the Allison diffi-
lties will be resolved. But time is of the essence.

New Types

Only four new models of importance have turned up
ce the twin-engined Navy fighter, the Grumman Sky-
ket. Three are also naval craft: an inverted gull-
nged single-seater monoplane fighter, the XF4U-1, by
ited Aircraft's Vought-Sikorsky division; the Douglas
D-1, a monoplane dive-bomber; and the Curtiss
B2C-1, also a monoplane dive-bomber and successor to
famed line of Curtiss Helldriver biplanes. The XF4U-1
powered by the Pratt and Whitney Double Wasp
850 h.p. at take-off, 1,600 at 20,000ft.). The Douglas
e-bomber is now in production; it is Twin Wasp
ined. The Twin Cyclone-po[illegible] Curtiss plane is the
est and fastest dive-bomber e[illegible] designed for the Navy;
top speed exceeds 300 m.p.h., in level flight, of course.
The basic Seversky (now Republic) single-seat pursuit
ign has undergone another modification, and with a
uble Wasp now appears as the P-47, in which the British
chasing Commission appears to be taking considerable
rest. It may order, particularly if one of the turbo-
erchargers now under development for high altitude use is made available along with the plane. The U.S. Army has just let a contract for several hundred P-47s.



The ten-ton Bell Airacuda has been revived in three distinct versions.

The 10-ton twin-engined Bell Airacuda fighter (Allison V-1710's in pusher installations), with which many difficulties have been had, and which had been dropped by the Army, has been revived. Three somewhat different Airacudas are now being tested at Wright Field, and a production order for one of the types is anticipated. The Airacuda was the first plane on which 37 mm. guns, two of them, each firing forward from an engine nacelle, were mounted. Additional armament: Four rifle-calibre machine guns.

In sum, it would appear that, though enormous orders are on the books and British deliveries will approach the thousand-per-month rate, they will not climb materially in the next three months, and will not reach really decisive proportions for at least another eight months to a year.

Further Aid for Roof Spotters

HE Minister of Home Security announces that he is
arranging a scheme for supplementing existing arrange-
ts whereby information gained by the Observer Corps about
presence of enemy aircraft is to be made available to roof
ters at selected factories. It is emphasised that the new
ngement should give additional protection and encourage-
t to workers to carry on after the sounding of the "alert."
are asked to point out that application to be connected with
new service should not be made. Selected firms will be
fied as soon as possible.

Aircraft Production

IE December issue of *Aircraft Production* includes the
final instalment of a long article dealing with the building
e Airspeed "Oxford" twin-engined trainer, with many
iled illustrations showing its construction. There is also
ll-page description of the world's largest bomber, the
glas B.19, which weighs 164,000 lb. and took 2,000,000
-hours in its planning and construction. The novel
od of mounting the 2,000 h.p. radial engines flexibly in
acelles is something entirely new in aircraft construction.
protection of magnesium metals is the subject of a tech-
review, and other articles include the use of cork in
aft, fluxes for soft soldering, a modern works canteen,
the usual illustrated review of machine tools and shop
ment. *Aircraft Production* is published each month,
1s. 6d.

Air Freight in America

s very evident that a large expansion in the carriage of
ods by air will occur in America in the near future. Not
has American Export Airlines bought the Central American
e TACA (Transportes Aeroes Centros Americanos), as was
hadowed in our issue of November 7, but the United States
ht Company is planning a big development relating to
ick-up and delivery of air freight.
r contemporary, *American Aviation*, reports that Captain
Robb Wilson, president of the National Aeronautic Asso-
n, has been appointed air freight consultant by this latter
any. His job will be to formulate plans for the use of
reight companys truck fleet in ground transport of the
carried by air. At present the Railway Express Agency
all this work.

American Export's entry into the Central American field is for two reasons. First, TACA is a very large freighting concern, and, secondly, the acquisition of the company gives Export a flying start in its campaign of competition with Pan American in this area and South America for passenger transport. TACA was started in 1931 by Lowell Yerex, a New Zealand war pilot. During 1940 the company will transport about 30,000,000 lb. of freight, 5,000,000 lb. of mail, and 125,000 passengers. It has 235 airports, with scheduled stops at 125 of them, and operates 40 radio stations. Its staff amounts to 700. It is still using some of the three-engined Fords, but recently bought some Lockheed 14s.

The Automobile Engineer

ALTHOUGH large sections of the British automobile industry are now engaged on aircraft and other work, the personnel is not losing sight of the post-war years, when a return to ordinary conditions will have to be considered. The annual review number of *The Automobile Engineer*, which has just been published, deals to some extent with the war activities of the automobile industry, but it also looks to the future in an important article on design development. Of particular interest is an account of the investigations now being carried out at the research laboratories of the Institution of Automobile Engineers, and engineers will be impressed by the description of the foundry organisation of Morris Motors, Ltd., whose cylinder blocks and heads are produced by the all-core method.

Copies are obtainable from Dorset House, Stamford St., S.E.1, at 2s. 6d.

FLIGHT

BRITISH AIRCRAFT NUMBER

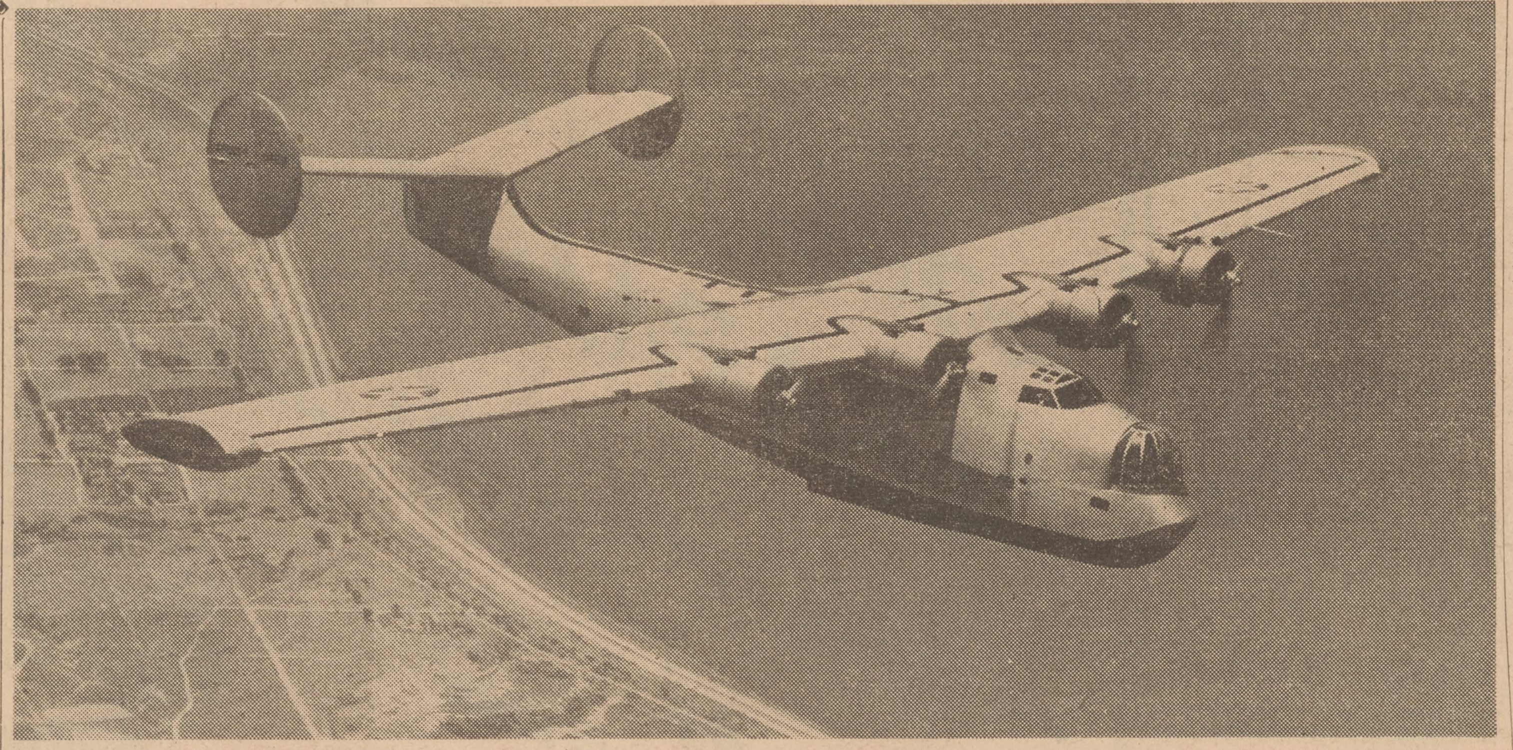
NEXT THURSDAY, December 12th, "Flight" will publish its annual illustrated review of British aircraft and aero engines.

A definite order should be placed immediately with your newsagent.

Sunday April 28-40

Flying Boat Plants Adding 100 Employees Each Week

Mightiest of Naval Patrol Bombers



4800 HORSEPOWER makes this Consolidated Aircraft model the greatest naval patrol bomber in the air today, experts agree. The XPB2Y shown above the San Diego plant is powered by four twin-row, 14-cylinder motors, and is capable of round trip nonstop flights across the Atlantic with a 5-ton load of bombs. Specifications are kept secret.

Total of 10,000 Expected at Consolidated

By Derek White

Just 40 minutes by air south of Los Angeles, on San Diego Bay, is the plant of the Consolidated Aircraft Corporation, builders of giant Naval Patrol flying boats. The company is now engaged in an expansion to end all expansions, in expectation of additional orders which will dwarf their present backlog of more than $50,000,000.

Present plant area is 447,332 square feet. This is being increased by 87 per cent, which will bring total floor area to 843,332 square feet. Approximately 5000 employees are now on the payroll, but men are being added at the rate of more than 100 per week so that when the new plant is completed, employees will total 7500. Approximately 10,000 men will be employed by the end of this year.

Consolidated Aircraft has been built for an initial capital of only $25,000, mainly through the efforts of Major Reuben H. Fleet, president. The company, largest builders of commercial and naval flying boats in the world, was organized in 1923 in East Greenwich, Conn., and first operations were carried on in rented space only 100 feet by 150 feet in size.

START IN BUFFALO

First order received was for 50 two-place tandem trainers. Quarters then occupied were too small to permit construction of these ships, so the company moved to Buffalo, N. Y., where 28,000 square feet of space was rented in an empty factory building which contained plenty of additional room for expension. As the company grew, additional space was added, until by February, 1934, plant area covered 197,298 square feet.

During first years of operations, the company devoted much time to the development of large flying boats, one of these early types being the Commodore, the prototype of which was the first monotype flying boat in the world. Fourteen Commodores were built, of which 13 are still flying, one having been burned in a hangar fire.

These first boats were built so strongly that one, having occasion to make a forced landing in Cuba, landed safely without injuring a passenger and was easily repaired.

MOVE TO SAN DIEGO

From the Commodore series was evolved the Navy model P2Y. By 1935 the company's principal business was the building of large flying boats for the U. S. Navy. Testing of these boats at Buffalo was almost impossible during six months of the year, because of ice on Lake Erie, and it was for this reason that Consolidated moved to San Diego. This decision was one of the most important made by company executives.

Southern California weather conditions made year-round testing possible, and at the same time the move gave the company the opportunity to build a modern plant to fit their business, rather than continue to fit their business to existing buildings which prevented economical and fast production.

The first San Diego factory had floor area of 246,841 square feet, and was the newest and most modern airplane plant in existence. Manufacturing operations were started in San Diego in 1936, and during that year the Consolidated Company built and sold $4,085,978 worth of airplanes, as compared to sales of $593,000 just 10 years before.

BIG U. S. CONTRACT

In December of last year the company received a Government contract for $20,016,099 worth of airplanes, a single order larger than total business done by the corporation during the first 12 years of its existence.

Consolidated flying boats have made many extraordinary flights, but to company officials and to the U. S. Navy, they appear on the records as "routine." Among the more spectacular trips have been a number of transcontinental flights, the first of which was by Richard Archbold, from San Diego to New York in a flying boat, 2700 miles in 17 hours, three minutes. Archbold made two later transcontinental flights in Consolidated boats, both being from San Diego to Miami, Fla., 2300 miles non-stop. Other sensational overland flights were made by Commander Andrew Crinkley, who flew a four-engined Consolidated patrol boat from San Diego, via Salt Lake City, to Anacostia Naval Air Station, in 13 hours, then flew back to San Diego via Texas.

Many routine naval flights deserve mention, including a formation flight of 48 boats to Pearl Harbor, Hawaii, 2553 miles in 25 hours; another formation flight of 15 boats to Pearl Harbor in the record time of 16 hours; flights totaling 19,000 miles over the Arctic regions, and a 24,130-mile flight in a twin-engined flying boat from New Guinea to San Diego, by way of Australia, the Indian Ocean, Africa, across the Atlantic, and overland to San Diego.

"EYES OF NAVY"

Consolidated flying boats can truthfully be called "the eyes of the Navy" as those now based and in use at various Atlantic and Pacific stations control 60,000,000 square miles of land and sea, an area equal to more than one-third the surface of the earth. These naval patrol boats have flight ranges of 4000 miles, more than sufficient for round-trip, non-stop, flights across the Atlantic. Twin-engined boats have wing spans of 104 feet and weigh 15 tons when fully loaded. Top speed is 199 miles per hour.

The latest consolidated naval flying boat, now in quantity production, is a four-engined ship, specifications of which have not been released by the U. S. Navy. A new commercial model, now being tested at San Diego, but not yet in production, is the first airplane of any kind, land or sea, to be fitted with the new 18-cylinder, 2000 h. p. Wright Cyclone engines.

This two-engined ship has a wing span of only 110 feet, but weighs 50,000 pounds loaded. The hull contains two complete decks with accommodations for 52 passengers for day operations, or sleeping accommodations for 28 persons. Speed is approximately 250 miles per hour.

A new U. S. Air Corps bombardment airplane has recently been put into production, marking Consolidated's first entry into the four-engined bombe field.

BRITISH GET U. S. BOMBERS

Navy News 12/15/40

The first of 26 Consolidated Model 32 4-Engine Land Bombers, which would have become the United States Army's B-24's, are to be delivered to the English. Delivery is expected before March 1, 1941.

The bombers are similar to the Consolidated prototype Model 32, first flown late in 1939. Incorporated in them are the latest military features designed to meet the combat requirements learned from the present European conflict.

The planes probably exceed 300 miles per hour in speed, have a range of approximately 3,000 miles; and a bomb-carrying capacity of approximately 4 tons.

These planes are capable of carrying from England a full bomb load to almost any sector in the involved European area and return non-stop, or they can operate by shuttling between England and British bases. Their speed, and defense and attack armament give them adequate protection from all angles. The planes are full cantilever, 4-engine, all-metal, high-wing monoplanes, with high aspect ratio wings and retractable landing gear. Fowler flaps aid this high-speed aircraft in take-offs and landings. Their landing gear is of the tricycle type, with single wheel forward.

Approximate dimensions are: wing span—110 feet; fuselage length—64 feet; height—19 feet. The number of the crew varies with the mission to be performed.

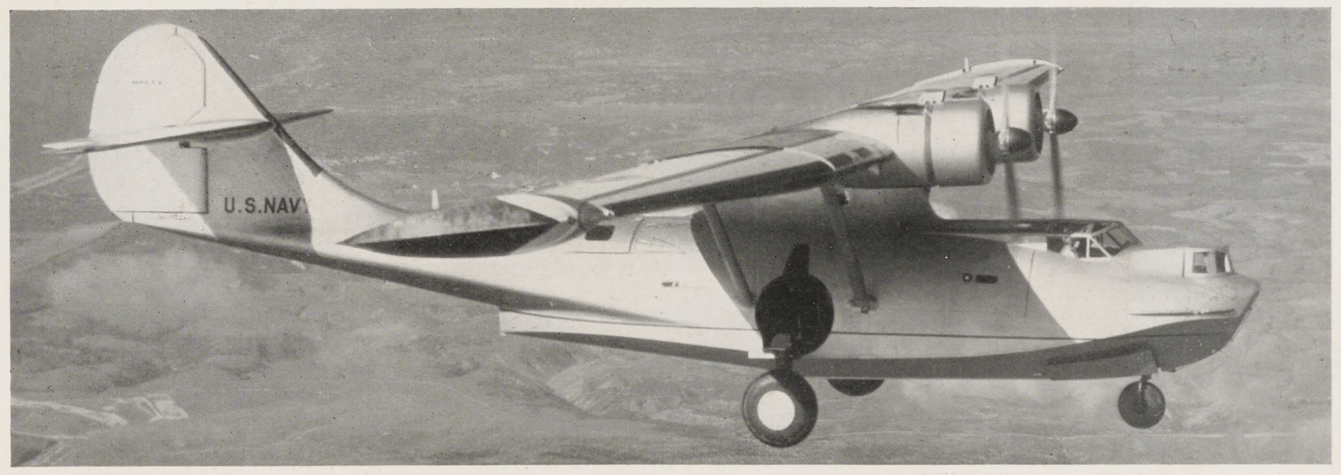
New Aircraft

INTAVA WORLD
March 1940

THE CONSOLIDATED MODEL 28-5A



The Consolidated Model 28-5A twin-engined Amphibian with wheels lowered.

THE Consolidated Aircraft Corpn. has delivered to the U.S. Navy an amphibious version of the well-known Model 28 (Naval PBY Series) flying-boat which is designated the Model 28–5A (XPBY-5A).

The landing gear is of the tricycle type with the main wheels retracting into wells in the sides of the hull and the nose wheel into a compartment in the bow, which is closed by automatically-operated hatches. All three wheels are operated by a central hydraulic drive, the power being derived from the main power-plant or from an auxiliary engine. Emergency hand gear is also provided.

There is no need for a beaching crew as the Model 28–5A can climb a ramp or beach under its own power and can descend in the same manner completely controlled by its brakes.

No special technique is needed for either take-off or return to land or water. The side wheels are above water when the machine rises on its step to take-off and water is automatically ejected from the bow wheel hatch before it is in the air, so that flying trim is not affected. When running up the engine on land the wheels may be locked, elevators pulled hard back and both engines given full take-off throttle without any possibility of the nose wheel rising from the ground. When landing the brakes may be put hard on without any adverse effect. In a side-wind landing the tendency is to straighten out.

Smokestacks or Geraniums?—San Diego Achieves Happy Combination of Both

Posies Win—Well, San Diego Is Both Aesthetic and Practical

Special to The Christian Science Monitor

SAN DIEGO, Calif.—"Smokestacks or geraniums!"

That was the battle cry in San Diego during the administration of Mayor Louis Wilde, 1917-21.

On one side of the political fence were the advocates of "smokestacks" or an industrialized city.

Arrayed against this theory of factory expansion were those who believed that San Diego should be developed along cultural lines, with the "geranium" side accentuated.

The contest lasted for a number of years, and ended in a technical stalemate—because today San Diego is rapidly becoming industrialized without smokestacks, and yet retaining the "geranium" feature.

Things Start With Lindbergh

This transformation has taken place since May 10, 1927, when a tall lanky youth named Charles Lindbergh lifted his San Diego-built monoplane from the bumpy runway of Rockwell Field on North Island just across the bay from San Diego.

As a result of the impetus placed on aircraft development since Lindbergh flew the "Spirit of St. Louis" to Paris, this city today claims the title, "Air Capital of the West."

"And we believe we can substantiate that claim because we estimate that there is more flying in San Diego per year than in any other American city," declares Thomas Bomar, industrial manager of the local Chamber of Commerce. "This is the nation's and probably the world's, largest naval aviation center, and we also have the Consolidated Aircraft plant, the world's largest manufacturer of flying boats."

In San Diego, also, are situated the plants of the Ryan Aeronautical Company, makers of planes, aircraft parts, and operators of a large student flying school, and the Solar Aircraft Company, reputed to be the world's largest makers of exhaust manifolds for aircraft engines.

The aircraft industry, which now is challenging the United States Navy's claim as the city's largest single pay roll, was slow in its development.

T. Claude Ryan, who sold out to the Mahoney company which built Lindbergh's monoplane, was in the business of carrying passengers between here and Los Angeles as early as 1925.

The "Spirit of St. Louis" was built in an abandoned fish and fruit cannery at the foot of Laurel Street on the edge of Lindbergh Field. It is now the factory of the Solar Aircraft Company.

Then a Municipal Airport

The plan of a municipal airport near the heart of the city was considered by a Chamber of Commerce committee as early as 1925. but it was not until after Lindbergh flew to Paris that the voters stamped their approval on a $650,000 bond issue for Lindbergh Field. The land was reclaimed from the bottom of the bay for the 112-acre airport.

Mr. Ryan again entered the plane-manufacturing business about 1933, producing a light sport plane. His factory was moved to Lindbergh Field, which then became the center of the city's aircraft industry.

Meanwhile, the Solar Aircraft Company was organized in 1927 to manufacture an all-metal plane. However, the depression knocked the bottom out of the aircraft industry, and this company turned to the manufacture of a custom-built exhaust manifold for which it later became famous.

San Diego became an important aircraft center in 1935 when the Consolidated Aircraft Company moved its plant from Buffalo, N. Y., because of the equable weather conditions, and the proximity to the naval air station at North Island for which it has developed hundreds of the giant PBY flying boats.

During the past year, the city's aircraft plants have been swamped with orders, mostly in connection with Uncle Sam's new national defense program.

Huge Aircraft Orders

The combined backlog of unlled orders for Consolidated, Ryan, and Solar is sufficient to keep the factories working day and night until the fall of 1941, or longer, it is estimated.

Of this total of unfilled orders, Consolidated has many millions of dollars of planes to be built as quickly as possible. The order from the Navy Department for $20,016,699 of aircraft forced officials of Consolidated to order an immediate expansion of facilities.

The expansion program, now under way, calls for additions for final assembly, final finish, paint shop, wood mill, experimental, maintenance and office departments, which will cover 396,000 square feet. In addition to the buildings, all factory yard areas will be paved, where final operations can be carried on virtually throughout the year.

Ryan has recently completed a new $150,000 factory on the western edge of Lindbergh Field, while Solar has also expanded through the addition of a large factory annex.

Consolidated employs about 4,300 men, and is adding about 100 men a week; Ryan now has 900 employees and Solar approximately 475. The combined pay roll is around $700,000 monthly, and the value of aircraft planes and parts totals about $25,000,000 yearly.

It is the plan to increase the number of factory workers to 7,500 by Jan. 1, which will bring the aircraft monthly pay roll to between $1,500,000 and $2,000,000, or equal to the Navy's pay roll in this area.

Labor-Training Active

In order to meet this unprecedented demand for skilled men in the aircraft factories, San Diego is preparing her own young men in three tax-supported institutions, the new Vocational School in San Diego; at the Sweetwater Union High School in Chula Vista, and at the Vista Civilian Conservation Corps school, under sponsorship of the Escondido high school district.

In an effort to train skilled technicians to become riveters and sheet-metal workers in the three factories, the aircraft manufacturers are co-operating with the city school system and have released 19 of their best craftsmen to train the youngsters in the preliminary work of plane-making.

The personnel directors of the factories meet occasionally and interview the applicants as to their adaptability, and other necessary qualifications.

The graduates of the schools are placed as fast as jobs become available, it was explained.

Incidentally, the size of Lindbergh Field has been increased to 350 acres, and soon will be 500-acres in size, with the completion of the current dredging operations.

So, today, San Diego has both "geraniums" and "smokestacks" in the figurative sense. It has become industrialized without the costly smoke of some other cities. Yet even at the aircraft factories the "geranium" theme is being carried out in shady, quiet patios filled with flowers, and lined with palm trees.

CONSOLIDATED AT TOP SPEED THROUGH 1941, SAYS FLEET

Consolidated Aircraft Corp. has sufficient contracts on hand to keep the huge municipal airport plant working at top speed until the end of 1941, Maj. Reuben Fleet, president, yesterday informed Harbor Commissioners R. H. Van Deman, Emil Klicka and William E. Harper.

Fleet intimated that no further additions to the plant will be made following completion of the $2,000,000 construction program this month. He said steel work on virtually all the new buildings is about finished and that work will be started immediately in laying floors in the new experimental building.

Fleet appeared before the harbor commission primarily to plead for more vigorous action in beautifying Pacific highway from Broadway to Harasthy st. He said Consolidated is expending and has expended many thousands of dollars in planting trees and shrubbery along the highway front of the aircraft plant, a total length of one mile on both sides of the thoroughfare. He declared a check disclosed 27,000 cars pass the Consolidated factory daily and asserted if Pacific highway is the city's front door it should be made presentable. He was accompanied before the commission by Milton Sessions of the park board.

The harbor commission advised Fleet they were taking excellent care of trees and shrubbery planted on tidelands under jurisdiction of the harbor department but that the park board was responsible for other sections.

New Naval Aviation Post At San Diego Announced

Creation of a new navy post at San Diego, that of general inspector of naval aviation for the western district, was announced yesterday by the navy department.

Ordered to assume charge of the new post was Comdr. Samuel J. Zeigler, now attached to the staff of Vice Adm. Charles Blakely, battle force aircraft commander.

Union - 5/17/40

Highway Beauty Meeting Called

Financing of the proposed long-term Pacific highway beautification program from the Orange county line south, will be discussed at a meeting in the office of Glenn Rick, city planning engineer, at 2 p. m. today.

The conference, said Rick, was called by George Marston, at whose suggestion the program was drafted, and is to be attended by L. Deming Tilton, state planning director; Dana Bowers, state landscape architect; E. E. Wallace, district engineer, state division of highways; Philip Gildred, chairman, and Hugh Strong, secretary, of the Pacific highway committee; Lorin Deewall, county planning engineer, and Rick.

FUND SOUGHT

Fred Rhodes, city manager, has recommended to the council that $2500 be sought from the city's next allotment of state gasoline tax funds to get the program under way within the municipality. From other sources, however, it has been indicated that state division of highways might not approve this plan unless the city agrees to put up some of its own funds.

The beautification committee also has asked county supervisors to provide funds in their 1940-41 budget to start the beautification outside the city limits.

CARE OF TREES

Meantime, the harbor commission, through its secretary, Joe Brennan, port director, filed a letter with the council yesterday asking it to work out a plan to care for trees planted along Pacific highway from Barnett ave. to Broadway. Brennan reported that Maj. R. H. Fleet of Consolidated Aircraft Corp., and Milton Sessions, park commissioner, recently appeared before the harbor commission.

Maj. Fleet said his company had spent thousands of dollars in planting and maintaining trees on its lease. The harbor commission tends to the trees in the Lindbergh field area, and Civic Center maintainence crews take care of those in front of that building. The park department, with the number of men available, cannot care for all of the balance, Sessions reported, and many are being neglected.

Martin Contract Gained by Solar

A $150,000 order from the Glenn L. Martin Co., Baltimore, for manifolds, tail pipes and preheaters during March was announced by Edmund T. Price, president of Solar Aircraft Co., San Diego. The parts represent the latest type equipment, and will be installed in military planes for the U.S. Air Corps.

The Martin order, and the $180,000 order recently received from Consolidated Aircraft Corp., are the two largest in Solar's history. Mr. Price said both carry options for considerable quantities which may be exercised during the year.

As a result of the two bookings, Solar's backlog is reported nearing the $1,500,000 mark.

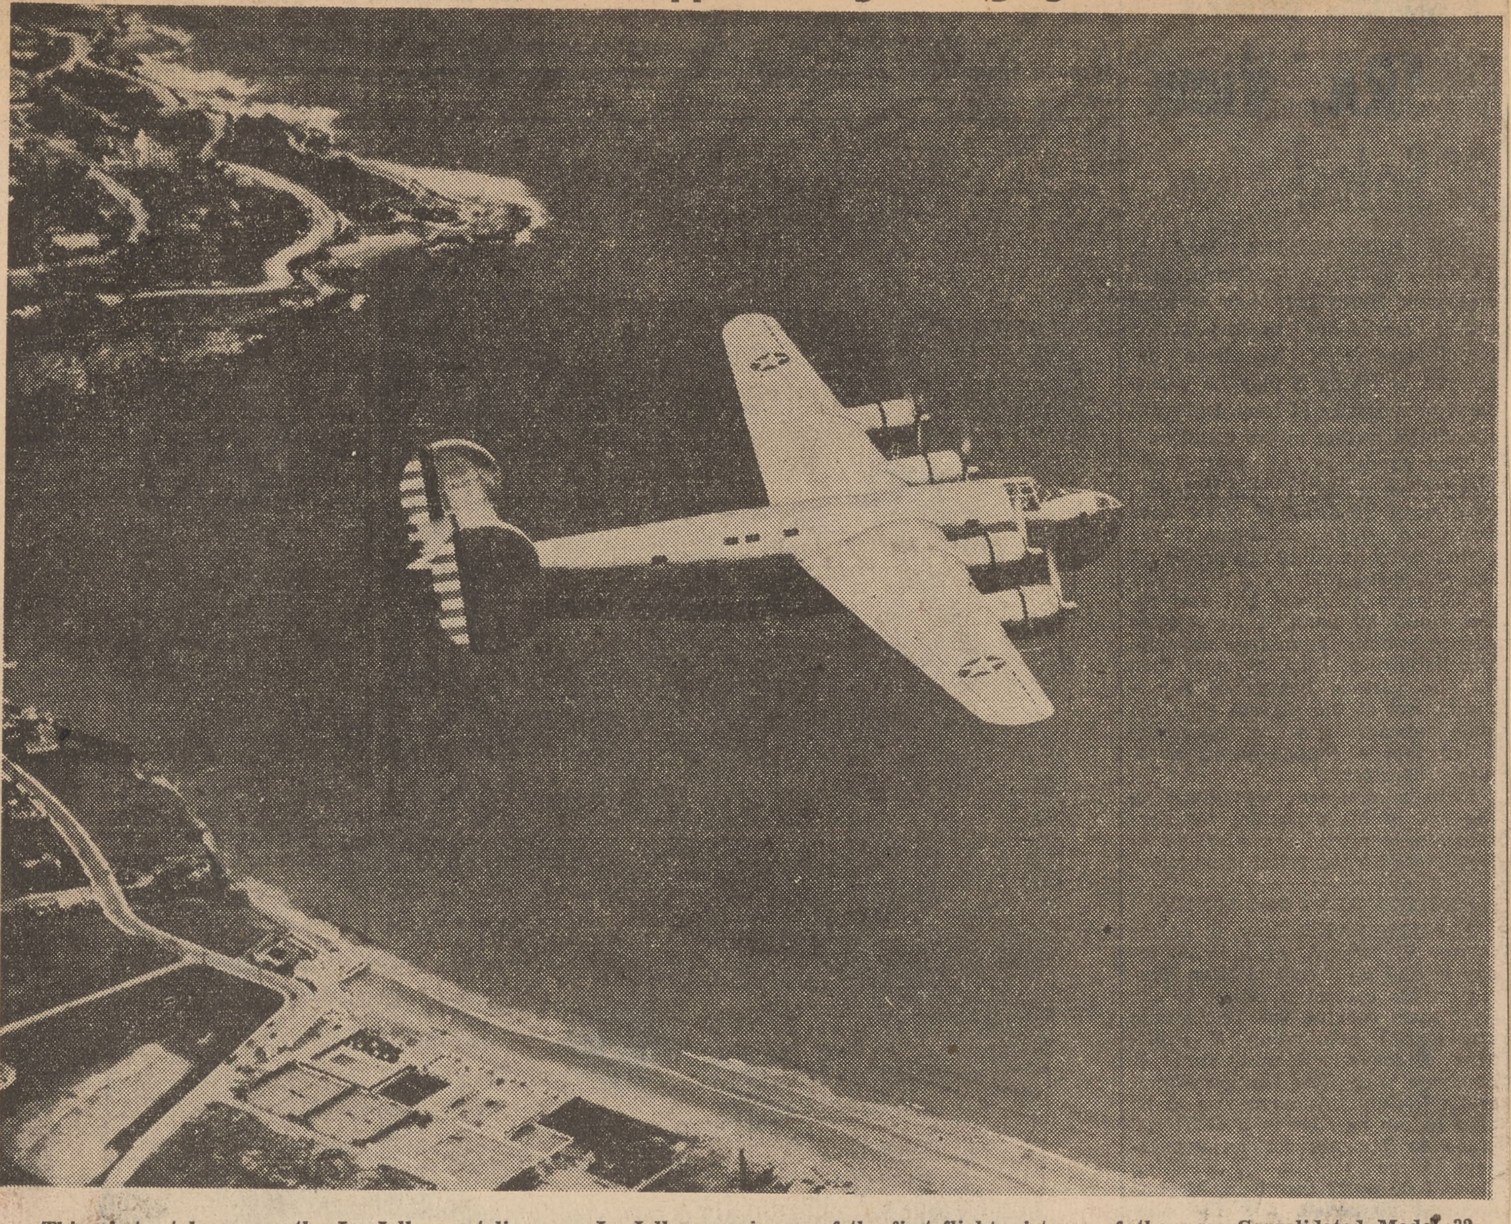
Uncle Sam's Latest Consair Bomber Snapped in Flight Winging Over La Jolla Shores

5/10
1940



This photo, taken over the La Jolla coast line near La Jolla cove, is one of the first flight pictures of the new Consolidated Model 32 four-engined land bomber, which is undergoing tests at San Diego. Designated by the army as the XD-24, the plane weighs 40,000 pounds, has a speed of more than 300 miles an hour, a range of approximately 3000 miles and a bomb-carrying capacity of approximately four tons. It has a wing span of 110 feet. Its fuselage length is 64 feet and its over-all height, 19 feet. It carries a crew of from six to nine.

Youth Said No Bar to Jobs At Aircraft Factory

A report that Consolidated Aircraft Corp. was declining to take on any more men between the ages of 18 and 25 because they would be the first to be drafted in the event of war was emphatically denied at the plant late yesterday.

Donald Frye, plant personnel director, characterized the rumor as "absolutely false," and said the company was continuing to employ men of that age when they could meet the concern's requirements.

CONSAIR PLANE DESCRIBED

The new Consolidated 7B-24, now undergoing flight tests, has "a speed over 300 miles an hour, a range of approximately 3000 miles, and bomb carrying capacity of approximately four tons." In addition, the plane has a tail turret.

AIRCRAFT NEWS - 5/2/40

New Type U.S. Bomber May Be Sold Abroad

WASHINGTON — The army is permitting aircraft manufacturers to negotiate with foreign governments for possible sale of a new type four-engined 17-ton bomber with a cruising radius of approximately 4000 miles, it was learned several days ago.

The plane, known as the B-24, is manufactured by Consolidated Aircraft Corp., San Diego, Calif., and reputedly can travel more than 300 miles per hour. The army ordered about 40 of these planes last fall as part of its air expansion program.

N. Y. C., TIMES
MAY 17, 1940

SAN DIEGO, Calif., May 16 (UP)—Production facilities of existing aircraft plants must be greatly enlarged if President Roosevelt's demand for 50,000 fighting planes is to be filled, Major Reuben H. Fleet, president of Consolidated Aircraft, said today.

"We must know ahead of time what orders might be expected in order to produce in any such emergency," he explained.

CONSOLIDATED FACTORY EXPANSION

May 1940

ANNOUNCEMENT was made by the Navy Department on December 20th, 1938, that the Consolidated Aircraft Corporation had been awarded a contract for $20,016,699. This is the largest single order for airplanes ever placed by the United States Government, and it increased the backlog of Consolidated to over $40,000,000. With work on other contracts occupying most of the production capacity, the new record order has made it necessary for the company to add new plant facilities to meet the deliveries required by the contract.

The present plant of Consolidated is one of the finest and best integrated airplane manufacturing plants in the United States. When the company erected its new plant at San Diego the buildings were designed and constructed to meet the most advanced type of airplane manufacturing facilities. The original factory buildings are less than five years old and the large experimental building, the photo, physical, and chemical laboratory; paint storage and tool storage buildings are just over three years old.

Prior to the expansion now under way, Consolidated had under lease 24.7 acres on which the factory buildings are located, and an additional 7.6 acres under option. New leases and options now cover an area of 64 acres. This area is all located on Lindbergh Field, San Diego's municipal airport.

The building expansion, comprising additions to final assembly, final finish, paint shop, wood mill, experimental, maintenance and office departments will aggregate approximately 396,000 square feet, or an increase in the present area of 87%. The largest single area to be roofed is the new final assembly building measuring 360 feet by 720 feet. This has a clear span of 120 feet and a clearance from floor to roof truss bottoms of 36 feet. Sawtooth roof construction similar to the existing buildings will be used.

In addition to the buildings, all factory yard areas will be paved with asphaltic concrete. These areas, due to the mild southern California climate, can be used virtually the entire year around for final assembly operations. Many maintenance activities likewise may be practically completed out of doors and then transferred to the plant with a minimum of interference with production.

In undertaking the plant expansion which will enable the delivery requirements of the $20,016,699 contract to be met, a closing agreement between Consolidated Aircraft and the United States Treasury Department was entered into. This agreement provides that the cost of certain additional excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company.

THE UNITED STATES FLEET MAGAZINE

Sentence Tool Thief

Tribune - 5/24

Convicted of stealing parts of a machine tool from the Consolidated Aircraft Corp. plant, Bronson Parrett, 29, today was sentenced to 30 days in the county jail by Municipal Judge Howell Howe. Parrett said he wanted to use the parts to construct a vise.

10-Day World Air Cruises Seen

"If the world does not destroy itself through the use of aircraft in the present war, cruises around the world in luxurious flying boats, requiring only from 5 to 10 days, will be a travel feature of peacetimes."

So predicted Richard Archbold, explorer, aviator and research associate in mammology of the American Museum of Natural History, at a dinner in his honor last night in Hotel San Diego.

Archbold received a scroll from the National Aeronautic association outlining his aerial achievements in the Consolidated flying boat Guba, and the San Diego Aero club, local chapter of the national organization, gave him a handsome gold trophy.

CITATIONS INSCRIBED

Inscribed on the awards, with the names of the Guba's crew, were citations for the following feats: First navigation of the world by flying boat; first navigation of the world at its maximum diameter; first plane to fly across the Indian ocean, and first non-stop flight across Australia.

Members of the Guba's crew were Russell Rogers, chief pilot; Gerald Brown and Stephen Barrinka, engineers; Raymond Booth, radioman, and the late Capt. Lewis Yancey, navigator.

The N.A.A. scroll was presented by Maj. R. H. Fleet, Consolidated Aircraft corp. president and life member of N.A.A., while the Aero club trophy was presented by Earl Prudden, president.

HOPPED 3190 MILES

The Guba was used to transport personnel, supplies and scientific equipment for 11 months in The Netherlands New Guienea jungles, where Archbold led an American Museum of Natural History expedition. The big craft later was used in a survey flight for the Australian government across the Indian ocean, spanning the "down-under" continent en route. From Mombasa, Africa, where the survey flight ended, the Guba crossed that continent in easy stages and flew from Dakar to St. Thomas, Virgin islands, a distance of 3190 miles, in 19 hours, 33 minutes, believed to be the longest overwater flight on record. From St. Thomas, the trip continued to New York and thence to San Diego, completing its circle of the globe.

In his address of acceptance, Archbold cited the superiority of the air boat to the land plane in international travel, and showed movies of his epic flight. He came here for the dinner from Tucson, where he is conducting a plant and animal study.

Tribune- 5/17/40

Consair, Other Coast Plants Ready To Open Throttle, Build 50,000 Planes

By WILLIAM TYREE

LOS ANGELES, May 17 (U.P.)—Aircraft manufacturers, with an eye to new business and bulging backlogs of more than $300,000,000, said today the momentum given plane construction by the European war could be used to meet President Roosevelt's congressional request for a 50,000-plane defense program.

The southern California factories, which build 65 percent of the nation's large planes, reacted wholeheartedly to the president's proposal. Business leaders telegraphed senators, army, navy and cabinet officials their support. Job lines swelled proportionately.

"We can do it," Donald W. Douglas, youthful president of Douglas Aircraft Co., largest plant in the United States, said in offering his organization.

Will Meet Challenge

"It will take a three-fold expansion program of facilities now available," said Richard W. Millar, president of Vultee Aircraft, Inc. "Accomplishments in the past 12 months, however, can leave no doubt in the mind of the American public that this challenge can and will be met."

"If President Roosevelt wants to open the throttle for a 50,000 plane take-off, the American plane industry is ready to go—and go right now," in the words of Robert E. Gross, of Lockheed Corp.

North American Consolidated, at San Diego, and Boeing, at Seattle, agreed they were ready to push the program at maximum speed.

All of the plane factories have been spurred by the all-time high in orders for speedy pursuit planes, bombers, trainers and even commercial ships to expand into new factory space, increased payrolls and employes.

April Record Zooms

Exclusive of a reported order for 2000 planes at $200,000,000 for the Allies, the industry pointed to this zooming record for April:

Backlog—$300,000,000, up more than $40,000,000 from April 1.

Employes—33,030, up more than 3600 from April 1.

Monthly payroll—$4,400,000, up more than $252,000 from April 1.

April production—$9,000,000, up more than $715,000 from previous month production.

Gross, of Lockheed, said that despite the acceleration there was still much to be developed "inasmuch as few, if any, companies are working three shifts and the majority not even two full crews."

San Diego's three aircraft plants, Consolidated, Ryan and Solar, are "100 percent in back of President Roosevelt's defense plan," it was announced following the president's message to congress.

"Consolidated's business is to serve our country," said a spokesman at the plant, builder of navy long-range patrol planes and four-engined bombers for the army air corps. "We are prepared to push production at a maximum speed."

Expansion Noted

Consolidated has a backlog of approximately $70,000,000 as a result of a $20,000,000 order this month for planes for the Allies. The firm is expanding its plant at Lindbergh field.

The Ryan School of Aeronautics is prepared to expand its army air corps cadet training program almost three-fold as a result of the president's new program, it was understood. The company, which, since last July 1 has trained army cadets at the rate of 35 every six weeks, is ready to increase to 100 every six weeks. This applies both to training planes and instructors and to housing facilities, it is believed.

Edmund T. Price, president of Solar Aircraft Co., largest producer of exhaust manifolds in this country, stated today that Solar is ready to do its part in fulfilling the president's program announced yesterday calling for 50,000 new planes in the near future.

"Defense First Concern"

"Our country's defense requirements are the first concern of this organization, which has doubled its production in the last six months and has under way expansion for providing sufficient reserve capacity to again double the company's production," said Price.

The Ryan new two-story administration and engineering building is nearing completion on the west side of Lindbergh field, adjacent to the new Ryan aircraft factory. With the transfer of all personnel having to do with the manufacturing side of the company's business to the office and engineering building, the present administration building, located on Pacific blvd. at the airport, will be devoted entirely to offices for the Ryan School of Aeronautics and for governmental agencies, including the Civil Aeronautics Authority and the weather bureau.

Training Ships Delivered

The Ryan Aeronautical Co. last month delivered the last of the Ryan PT-20 low-wing primary training planes recently ordered by the army air corps. This marked completion of the third order from the air corps for this type trainer.

Now in production at the Ryan plant are a number of Ryan YO-51 "Dragonfly" observation planes for the air corps. The "Dragonfly" needs no regular landing field, as it can land and stop rolling in little more than its own length, and take off at a very steep angle in a limited distance. Also in production are a fleet of Ryan STM-2 military trainers for export.

Locally, no official word has been received by any aircraft plant authorities on President Roosevelt's suggestion that airplane manufacturers move their new plants away from exposed seaboard areas. About 18 months ago reports from Washington, D. C., said consideration was being given to a proposal of this nature, but so far no action has been taken. A suggestion came from Washington earlier this month that aircraft firms manufacturing seaplanes establish inland factories near waterways where areas for test flights would be available.

Consolidated Aircraft Corp. moved to San Diego in 1935 from Buffalo, N. Y. One of the principal reasons given for the transfer at the time was that San Diego's "all year" flying weather and this city's harbor facilities made San Diego a desirable location for a factory turning out planes of the type Consolidated manufactures.

Tribune May 14

Allied Order For Consair on 17th Birthday

New orders totaling approximately $20,000,000 for planes for the Allies, which The Associated Press reports from New York have been placed by the British and French governments with Consolidated Aircraft Corp., came as a "birthday present" for the firm, which this month is observing its 17th anniversary. The firm has been located at San Diego since September, 1935.

Prior to receiving the Allied order, the Consolidated backlog, which has been increasing rapidly the past year due to contracts for United States army and navy planes, totaled approximately $50,000,000. Unfilled orders now amount to $70,000,000, an all-time high for Consair.

Included in the new orders are an unannounced number of the "Liberator" model, a four-engined bomber which has a 300-miles-an-hour speed under heavy bomb load, it was reported from New York. This type recently was released for export by the state department.

Conferences Held in N. Y.

Conferences with representatives of England and France have been carried on for several weeks in the east by Consolidated officials, and C. A. Van Dusen, vice president and works manager, still is in New York, it was reported. Edgar N. Gott, assistant to Maj. Reuben H. Fleet, president, returned to San Diego yesterday.

With 5474 employes now at the plant, Consolidated is working day and night shifts. A $2,000,000 plant expansion, started early this year, is nearing completion. The largest new unit is a final assembly building, 360 feet by 720 feet, adjoining the plant to the north and fronting on Pacific blvd.

The four-motored bombers in the new order are reported similar to the new Consolidated army's B-24, which has an approximate gross weight of 40,000 pounds, a wing span of 110 feet and accommodations for a crew of from six to nine, with a bomb-carrying capacity of approximately four tons.

Indicative of the marked upswing in Consolidated business during the past 14 months is a report there were only slightly more than 1100 employed at the plant the latter part of March, 1939. By Dec. 1 last year this total jumped to 3200, increasing during the last six months to 5474.

Contracts Increase

The last big order for planes occurred in December, when the United States navy awarded a $20,016,699 contract for an unspecified number of patrol planes. This was followed in March by a foreign order of approximately $9,000,000 for navy planes of the PBY type. In March, 1939, the navy awarded a $4,699,000 contract to Consolidated, and in April last year the war department awarded the firm an order for an unannounced number of four-engined bombers totaling $2,880,000. The third order received in 1939 came on Aug. 10, when the war department awarded a contract for $8,485,000 for more four-engine bombers.

Consolidated Aircraft Corp. was incorporated May 29, 1923, and first was located at East Greenwich, R. I. In 1924, when Fleet and his associates were successful in an army competition and the firm was awarded a contract for the construction of 50 two-place tandem trainers, the plant was moved to Buffalo, N. Y., where factory space was leased over an 11-year period. The firm decided as early as 1933 to move to San Diego, and built its own plant here on Lindbergh field before transferring to the west coast.

The original San Diego factory building had approximately 10,000 square feet more than was occupied in Buffalo in the 1933 peak. In January, 1936, plans for building the present experimental building at the south end of the main factory were completed, and the experimental building was finished Nov. 15 that year.

Heavy Foreign Trade

During the past 17 years Consolidated planes have been sold to Brazil, Siam, Peru, Argentina, Mexico, Cuba, Canada, Colombia, China, Portugal, Turkey, Rumania, England and France. One plane, the flying boat Guba, was flown around the world by Richard Archbold, scientist, who used it in an expedition to New Guinea for the American Museum of Natural History.

Unofficial reports from Los Angeles state that a twin-motored, 15-ton plane, flown from San Diego to Felixstowe, England, last year, later was flown from England to Iceland, where the pilot was interned, having landed on the Danish-owned island after the outbreak of war in September. He is believed freed now, since England occupied Iceland this month.

Union 5/28

Consair Plans Improvements On Huge Bomber

Consolidated Aircraft Corp. officials said yesterday that improvements regarded as "highly advisable in light of recent war developments" were being made to the XB-24, rated as one of the world's largest and fastest bombers.

Although declining to disclose details of the improvements prompted by the European air warfare, company officials said no basic changes were being made.

The army air corps began tests of the 20-ton, four-motored bombers last February. Army officials had planned to fly the craft to Wright field, Dayton, O., after trial flights over a 10-day period.

Company officials said the bomber probably would go to Dayton after the "improvements have been made and further tests completed."

The bomber has a wing spread of 110 feet and flies at better than 300 miles an hour. It is powered by four 18-cylinder radial engines totaling 4800 horsepower. It has a cruising range exceeding 3000 miles carrying four tons of explosives.

The craft had been under construction more than a year at Consolidated under secret orders from the war department.

The army's new experimental observation plane, the Ryan-built Dragonfly, left here recently to participate in the army maneuvers in Louisiana. Mission of the plane, which can take off and land on a small area, will be to coordinate infantry movements and serve as a courier behind lines.

Make Changes In Consair Bomber

Tribune 5/28

Improvements regarded as "highly advisable in light of recent war developments" will be made at the Consolidated Aircraft Corp. plant to the firm's new four-motored army bomber XB-24, according to report by officials of the firm. They declined to give details of the changes, made necessary by European air warfare, but said no basic changes will be made.

The plane has been undergoing tests here since February, and is expected to be flown to Dayton, O., for final flights after the improvements are completed. The plane, with a bomb-carrying capacity of four tons, has a wing spread of 110 feet and a speed of more than 300 miles an hour.

The army's Ryan-built experimental "Dragonfly" observation plane left San Diego recently to participate in "courier" and "coordination" flights in the army maneuvers in Louisiana. The plane can take off and land on a small area.

THE TRIBUNE-SUN,

S. D. Aviation Executive Pioneer of U. S. Airmail Service

An early day mail carrying plane.

MAJ. R. H. FLEET

Credit Fleet With Starting Flights In 1918 From N. Y. to Capital

May 15

By HAROLD OSBORNE

America's smoothly functioning airmail service had its inauguration 22 years ago, when the first airmail was flown from New York to Washington, D. C., a distance of 218 miles, by Maj. Reuben H. Fleet, now president of Consolidated Aircraft Corp. Fleet made the flight May 15, 1918.

The airmail service began under the direction of the army, and Fleet, who saw flight service across the Atlantic in World war days, became the first airmail pilot over an extended run after having received army flight training at San Diego. A former Rockwell field flier, he trained at North Island and won the rating of junior military aviator at San Diego in 1917.

10-Mile Flight in 1911

Just 30 when the United States entered the World war, Fleet was the first man to land a passenger on the Kearny mesa, the passenger being Peter B. Kyne, the novelist, who then was a captain in the 144th field artillery. This flight was made in 1917.

Prior to Fleet's inauguration of the New York-Washington service, a 10-mile airmail flight was made back in 1911 by Pilot Earle Ovington. On that occasion Ovington was at Long Island and was given a small pouch of mail by Frank H. Hitchcock, postmaster general in President Taft's cabinet. He flew 10 miles to New York.

The airmail did not remain in the army's hands long after the May 15, 1918, flight. In less than three months' time, on Aug. 12, 1918, the postoffice took over the service, which was run under private contracts until early 1934, when the army again took charge for a short time as a result of cancellation of contracts. Later new contracts were awarded.

Early airmail flights were of the "hop-skip-jump" variety, the planes operating without emergency landing fields or night beacon lights. On July 1, 1919, a rebuilt single-motored wartime DeHaviland plane took off from Chicago to make the first flight of the Chicago-Cleveland-New York airmail route. The flight took nine hours.

On Transcontinental Basis

Airmail service across the continent started Sept. 8, 1920, from New York to San Francisco, with the mail being carried by plane during daylight hours and by train at night. Through ailmail service from coast to coast, with night flying, began July 1, 1924. Airway lighting and radio service went under the jurisdiction of the department of commerce July 1, 1927.

The first airmail left San Diego far Salt Lake City June 1, 1930, it was reported at the postoffice. Today there are four mail plane departures from here daily and four arrivals. The volume of San Diego's outgoing airmail for the 12-month period ending April 30, 1940, was 87,547 pounds.

Goal of 50,000 Held Feasible

SANTA MONICA, May 16 (U.P.)—A confident "we can do it" was the answer today of Douglas Aircraft, largest plane plant in the United States, to President Roosevelt's demand before congress for 50,000 warplanes for defense.

Donald W. Douglas, president of the company, said he believed all aircraft builders together could meet the needs of the government.

"No task is too great and no accomplishment impossible for a free people united in loyalty and love of its country," Douglas said.

"I am confident that the airplane industry of the United States can and will keep pace with needs and desires of the government.

"Every facility of our plants and every resource of our organization are at the service and call of our national defense, first, last and always.

"I know the American aircraft manufacturers, functioning under a free democratic system in the American way, and unhampered by politics and partisanship, can and will help the President and congress meet the challenge to everything this nation holds dear," he concluded.

The Douglas plant has a backlog of orders estimated at more than $100,000,000, has been turning out about $6,000,000 worth a month and has started construction of a new assembly building on a 10-acre site. Four other major southern California companies—Lockheed, North American, Vultee and Consolidated—have similar expansion programs.

U. S. Has 'First Call'

SEATTLE, May 16 (A.P.)—Philip G. Johnson, president of the Boeing Aircraft Co., said today he believed the American aircraft industry could expand sufficiently to fulfill President Roosevelt's plan for production of 50,000 planes a year.

"As far as we're concerned, the United States has first call on us always," he said. "Boeing is at all times ready to cooperate with the President in meeting the needs for national defense."

Held Simple Matter

NEW YORK, May 16 (A.P.)—Expansion of the American aircraft manufacturing industry to produce 50,000 military airplanes annually as suggested by President Roosevelt today "is relatively a simple matter" involving a three-fold personnel increase, the aeronautical chamber of commerce said in a statement tonight.

Expansion Needed

Production facilities of existing aircraft plants must be greatly enlarged if President Roosevelt's demand for 50,000 fighting planes is to be filled, Maj. Reuben H. Fleet, president of Consolidated Aircraft, said today.

"I agree with the President that we need the planes, but the existing plants must be augmented before we can produce any such number of planes. We must know ahead of time what orders might be expected in order to produce in any such emergency," he said.

The Consolidated plant specializes in the huge twin-motored PBY bombers which have augmented the navy's long-range scouting force.

AIRCRAFT NEWS

Huge Plane Orders Placed

5/16

Two Southern California aircraft companies yesterday shared heavily in a $150000000 Allied warplane order placed by the Anglo-French purchasing board reports from Washington stated.

Largest of the two contracts was believed to have been received by the Lockheed Aircraft Corp. of Burbank although company officials declined to affirm or deny the announcement which came from Rene Pleven French representative on the buying commission.

From San Diego came word that Consolidated Aircraft Corp. shared in the huge order to the extent of $20,000,000 — presumably for its new four-engined B-24 land bomber.

Consolidated executives would not elaborate although they indicated that their backlog, formerly $50,000,000, now stands at an all-time high of $70,000,00.

Lockheed and the Glenn L. Martin Co. of Balitmore apparently will split the remaining $130,000,000 of the total order disclosed by Pleven.

Union -- 6/21/40

Many Positions Open For Aircraft Workers

The state department of employment is seeking workers in the mechanical crafts for placement in the aircraft industry. Ray Mathewson, local manager, says he has orders for 317 mechanics, consisting of 15 draw bench mechanics, 66 sheet metal workers, 98 final assemblers, 23 spray painters and dope men, eight heat treaters, 24 machinists, 75 tool makers and jig builders, and eight tube benders. The positions are for aircraft workers or mechanics with training adaptable to aircraft needs.

The employer initiating this order, the Consolidated Aircraft Corp., through Don Frye, personnel director, set up the following specifications: Applicants should be local residents. They must be American citizens, with record of birth or completed final naturalization papers if not native born. They must be loyal to American ideals and free from subversive influences.

Because there has been such continuous demand the past year for metal trades craftsmen, the state department of employment finds its available files becoming depleted in required classifications and has requested WPA and SRA organizations to assist in furnishing available personnel from their projects or relief rolls for immediate referral and possible placement in aircraft industry.

This demand may continue at the rate of 200 men a week for several weeks, and indicates the rapid expansion of aircraft industry in San Diego.

WORLD'S LARGEST AMPHIBIAN

The Consolidated Aircraft Corporation's newest contribution to aeronautical progress, the Model 28-5A Amphibian, designated by the U. S. Navy for whom it was constructed as the XPBY-5A; has undergone its flight testing to become as a result, the largest amphibian plane in the world.

Basically the new Consolidated Amphibian is the Model 28 twin engined flying boat which the Navy knows as the PBY. This design of boat has already accumulated a remarkable total of massed flight records and reputation for sustained performance, and now there has been incorporated in the structure, the amphibian feature. The inherent advantages of the Model 28 boat have been retained, and the great advantage of land plane operation added. Thus the amphibian can operate from either land or sea, to land or water bases in remote localities, opening a vast new realm of utility.

The landing gear is of the tricycle type, with a single wheel forward and two aft, all of which are fully retractable. The side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. The nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive, and the operations are carried out in sequence automatically. A single lever controls both the extension and the retraction of the landing gear. Hydraulic pump power is derived from the main power plant or from an auxiliary engine, and may be operated by hand if necessary.

Flight characteristics of the Model 28 flying boat so highly perfected in the original design, have been unaffected by the incorporation of the landing gear, and several handling advantages have become apparent. Flight testing with the gear in all positions, and in combination with the retractable wing tip floats, failed to disclose any adverse effects. The same stable flying characteristics of the PBY are maintained, and there was found no loss of speed with the landing gear in the retracted position.

The advantages of the landing gear, aside from greatly extending the scope of utility for the Model 28, are many: For rough water taxying the extended gear serves as a sea anchor and greatly assists in control on rough open water, and in making an approach for mooring or ramp with an adverse wind. More engine power may be applied for short turns without undue acceleration. Turns on the water are achieved with far less skidding, and the danger of scraping the keel on the ramp is eliminated. There is no necessity for a beaching crew, as the ship can climb a ramp or beach under its own power, or descend in the same manner, completely controlled by the brakes. It may also operate from remote sand beaches without benefit of special ramps or facilities for handling.

The side wheels are above water when the ship rises on the step in making a takeoff, and automatic means have been provided to eject all water in the closed bow wheel hatch before the plane is in the air. Thus the flying trim is unaffected.

Repairs or routine servicing to the landing gear can be accomplished with a minimum of trouble. Normally, with a landplane of comparable size, the supporting of the plane's weight for repairs to the landing gear is an acute problem. In the Consolidated amphibian, the customary beaching gear lugs incorporated in all Model 28s are retained. All that is required for servicing of the landing gear is to attach a standard beaching gear and run the plane out of the water. The beaching gear lifts the landing gear clear off the ground where any servicing may be carried out. No special equipment is necessary, and since the beaching gear was designed for quick attachment and removal, the operation consumes a minimum of time.

In action the huge amphibian alights with a smooth absorption of its descending velocity, exhibiting no tendency to bounce or porpoise. When alighting on land, the ship's tendency in a side landing is to straighten out; and the brakes may be applied to the utmost without adverse effect. This technique simply increases the load on the nose wheel. No special procedure is needed for take-off or landing. The wheels may be locked, elevators pulled full back, and both engines given full take-off throttle without the possibility of the nose wheel rising from the ground. During recent testing, a landing was made in which a bump happened to be struck on the instant of contact with the brakes on. The accelerometer showed a very high reading, yet no trouble either structural or in handling, was encountered. With the familiar Model 28 wing tip floats extended, the drag is increased and the angle of glide is steepened.

(Continued on Page 30)

THE UNITED STATES FLEET MAGAZINE

Incorporation of the amphibian gear, as an integral part of the famous twin engined flying boat, without disturbing its basic flying qualities, makes the field of operations of the world's largest amphibian, the Consolidated Model 28-5A, virtually from anywhere to anywhere on the face of the globe.

May 1940

Make Changes In Consair Bomber

Tribune
5/28

Improvements regarded as "highly advisable in light of recent war developments" will be made at the Consolidated Aircraft Corp. plant to the firm's new four-motored army bomber XB-24, according to report by officials of the firm. They declined to give details of the changes, made necessary by European air warfare, but said no basic changes will be made.

The plane has been undergoing tests here since February, and is expected to be flown to Dayton, O., for final flights after the improvements are completed. The plane, with a bomb-carrying capacity of four tons, has a wing spread of 110 feet and a speed of more than 300 miles an hour.

The army's Ryan-built experimental "Dragonfly" observation plane left San Diego recently to participate in "courier" and "coordination" flights in the army maneuvers in Louisiana. The plane can take off and land on a small area.

AIRCRAFT NEWS

6/6/40

CONSOLIDATED TO HAVE HUGE PLANE FACTORY

Consolidated Aircraft Corporation's present expansion program, now being rushed to completion with full manufacturing facilities estimated as completed by August 1, brings this plant into full alignment with the President's recently announced emergency defense program for building a vastly expanded number of aircraft. When completed, Consolidated Aircraft Corporation will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,000 square feet of contiguous airport land under option for further expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

Consolidated Aircraft Corporation is unique in its possession of most favorable conditions surrounding its ascendancy as the largest aircraft plant in America.

The greater preponderance of its backlog now noted at over $70,000,000 consists of United States government work, with a smaller proportion of its contracts for foreign deliveries, leaving the company relatively free from any contingencies which might arise over the turn of events abroad.

In undertaking its present plant expansion to enable it to meet this volume of business, a closing agreement was entered into between Consolidated Aircraft Corporation and the United States Treasury Department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

Through the naturally equitable climate of San Diego, site of the huge plant, fully 30 per cent of the manufacturing operations in building airplanes may be conducted out of doors. Provision has been made for this by paving the entire plant yard area and providing suitable outlets for power lines, etc., thus giving exceptional flexibility in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. Taking as an arbitrary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent of spares furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World War period. Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other U. S. manufacturers combined.

As early as 1934, six Consolidated P2Y-1 twin-engined flying boats in the service of the U. S. Navy flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop.

Phenomenal success followed the current Model 28's, or U. S. Navy PBY's, the larger twin-engined flying boats. With these planes scarcely off the line the U. S. Navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Anotner 88 in groups of

from 18 to 18 at a time have been flown non-stop from San Diego to Coco Solo in the Canal Zone, a distance of 3087 miles. Aboard these planes were some 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29, a huge four-engined craft built for the U. S. Navy and the Model 31, a twin-engined flying boat boasting the first two radial air-cooled engines of 2000 horsepower each ever to be installed in an airplane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the U. S. Army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States Army Air Corps recently stated, "This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb carrying capacity of approximately four tons."

Union, 6/26/4

Consair Faces Record Backlog

$50,000,000 More In Orders Expected

By HOWARD MORIN

Consolidated Aircraft Corp. officials announced yesterday the backlog of the municipal airport plant is expected to reach $120,000,000 by Aug. 1. This is in conformity with the nation's tremendous national defense expansion program.

The current backlog is $70,000,000. Negotiations are under way for $50,000,000 in additional contracts for long-range patrol bombers for the army and navy. Already the largest integrated aircraft plant in America, Consair plans to add more buildings to those nearing completion. Details of the new structures are being worked out.

How events in Europe have affected Consolidated is graphically illustrated by the expansion program of the last 12 months. On July 1, 1939, the total personnel employed was 1129. Yesterday the total reached 6965. Two hundred are being employed each week with a maximum of 10,000 set for Aug. 1,

Consair Faces $120,000,000 Record Backlog

(Continued from Page 1)

the day the new $2,000,000 construction program will be completed.

Last March 6 the backlog of Consolidated was $49,000,000, sufficient to keep the plant operating until late 1941. The total number of men employed was 4300. Working three eight-hour shifts daily the factory will have sufficient contracts to keep it toiling around the clock until 1942 and possibly longer, officials say. Before Hitler began his march through Europe the maximum number employed at Consolidated was 3875.

MORE EXPANSION

The plant occupies 1,910,000 square feet of covered and uncovered manufacturing space. Under option from the harbor department are 954,440 square feet of municipal airport property, part of which is expected to be utilized within the next few months for construction of another assembly building exceeding 300 feet in length.

The magnitude of the expansion program which will be completed within another month is illustrated by the size of some of the buildings. The storage shed is 1000 feet long and covers 30,000 square feet of space.

The final assembly building is 700 feet long and 360 feet wide. Its huge doors each will be 120 feet long, which gives some idea of the tremendous wing spread of the new bombers soon to be added to the nation's sky fleets. The ground floor of this structure covers 259,200 square feet, the first and second mezzanine floors each 7200 square feet and the bonded stockroom 8000 square feet, a total of 281,600.

OTHER BUILDING

The experimental building annex covers 38,000 square feet. Other structures include a final finish building, office building, addition to the paint shop, boiler house and hull and wing department.

Consolidated is said to be the only aircraft plant in the world where construction work can be carried out in areas unprotected by roofing. Thirty percent of the manufacturing operations may be conducted out of doors at least nine months of the year. Provision has been made for this by paving the entire plant yard area, providing suitable outlets for power lines, thus giving exceptional flexibility to the plant in its construction and expansion program.

Since Consolidated moved here from Buffalo, N.Y., it has become the world's largest manufacturer of flying boats. The company, founded in 1923, has built four times as many airboats as all other U.S. manufacturers combined.

BOMBERS FOR ARMY

Re-entry of Consolidated into the land plane field was marked by the construction, testing and acceptance by the army of the four-engied bomber classified as the XB-23, whose gross weight exceeds 20 tons. It has a speed exceeding 300 miles an hour and a flight range of 3500 miles carrying four tons of bombs. The navy's new long-range offshore patrol bombers are just as fast and as heavily armed.

The Consolidated plant, with the completion of the final assembly building, extends for half a mile on Pacific highway. It is heavily guarded and extraordinary precautions are being taken to prevent sabotage and pilferage of plans of not only existing models but larger and more powerful bombers now on the drafting boards.

In a statement to stockholders last month Maj. Reuben H. Fleet, Consolidated president, gave an inkling of the company's Aug. 1 backlog when he said it would exceed $100,000,000 of "outstanding quotations were accepted." The report at the factory is that the negotiations are virtually completed.

---

5 Aircraft Employes Made Special Officers

UNION 6-30 '40

At the request of Clifford E. Peterson, police chief, deputies of Fred Sick, city clerk, have sworn in five aircraft company employes as special police officers who will serve without pay from the city.

They are: William H. Shattuck and George Roth, Consolidated Aircraft Corp., and Al M. Gee, C. F. Bennett and E. E. Schindler, Ryan Aeronautical Co.

Tribune, June 26, '40

New Consair Contracts Pending; $100,000,000 Backlog Anticipated

With a current "firm" backlog of more than $70,000,000 in orders for military planes, Consolidated Aircraft Corp. officials today said that "prospects were bright" that this would be increased to somewhere around $100,000,000 "in the near future."

Negotiations for additional army and navy contracts for long-range patrol bombers are under way at Washington, D. C. Increases in Consair's backlog are contingent upon the outcome of these parleys, company spokesmen said.

These spokesmen explained that the $100,000,000 figure was not to be construed as a ceiling upon possible future orders but that the eventual figure might exceed that amount "substantially."

Consolidated, famous as the manufacturers of the PBY patrol bombers which the navy for several years has used successfully in spectacular transocean mass flights, is known to be developing several new types for the army and navy that are expected to contribute much to the nation's current defense program. A recent development was a four-motored land plane which underwent tests here for the army.

Nearly-completed additions to the huge Consair plant virtually will double its capacity, making it the largest integrated aircraft manufacturing plant in the United States, and further expansion is planned.

Working night and day to rush the government's orders to completion today were 7000 employes and it was expected that 10,000 would be employed at the plant at the peak of production.

'Too Busy To Celebrate'

MAJ. R. H. FLEET

Trib. - 5/29

GROWTH RELATED AS CONSOLIDATED 17 YEARS OLD

"In some respects, I am sorry we are too busy to celebrate."

With these words, Maj. R. H. Fleet, Consolidated Aircraft Corp. president, concluded a memorandum to employes announcing that today marks the 17th anniversary of the huge aircraft firm.

In 1923 Fleet and his oldest associates recalled, the company was located in a small plant in Buffalo, N. Y., and employed 25 workers.

Today, 6014 employes were rushing to fill warplane orders of the United States and foreign governments totaling $70,000,000, the largest backlog in company history, marking it as one of the largest aircraft manufacturing concerns in the nation.

Expansion Under Way

Also under way was a plant expansion program which, when completed, will double the present capacity and cover 1,910,000 square feet of covered and open-air working space, making the plant the largest integrated plane-building factory in the United States, company spokesmen pointed out.

With the federal government embarked on a gigantic defense program and with world history hinging on armament production, Consair authorities predicted that new rush orders for this and other governments will, in the near future, raise the backlog figure to a still more stupendous total.

Since the firm moved to San Diego in October, 1935, it has produced upwards of 200 of the famed Model 28 PBY patrol bomber flying boats for the navy. These are the ships which participated in several spectacular transocean mass flights in recent years.

Guba Consair Product

The Guba, plane of Richard Archbold, American Museum of Natural History explorer, which last year made a record-setting flight around the world, and the plane in which Sir Hubert Wilkins encircled the north pole both were modifications of Model 28.

In addition, Consair has produced several experimental models for commercial and military use, including the newest four-motored 'flying fortress" now in the hands of the United States army. Also flown from the production line were 50 two-seater pursuit planes for the army.

When Consair first was organized, it specialized in production of the famed Fleet trainer, small two-place biplane, in which many of the nation's top-flight pilots learned to fly. Later, while still located at Buffalo, it entered the flying boat field, turning out several types for the navy and the 15 Commodores used in the first United States-Argentina commercial run.

In his memorandum pointing to the growth of the company, Fleet stated:

"Today we are in a factory of our own, tailored to our business and located in the city of our choice."

Consair authorities pointed out that, by coincidence, the number of employes passed the 6000-mark on the company's anniversary today.

THE TRIBUNE-SUN, San Diego, Calif., Tuesday, June 11, 1940

California Aircraft Industry Leads In Drive To Complete U. S. Defenses

With colleges and technical schools turning out more and more skilled men and factory payrolls increasing weekly, California's aircraft industry today was in the vanguard of the drive to carry out President Roosevelt's defense armament program, The International News Service reported from Los Angeles.

Agreeing that the aerial phase of the program is an "all-California job," heads of six of America's leading plane companies located in California, including Consolidated Aircraft Corp., at San Diego, have pledged their resources to doing the job set for the industry by the president's plan for 50,000 planes.

The California aircraft industry now employs more than 33,000 workers, and has an annual payroll, constantly rising, which now stands at more than $50,000,000. For many months, figures show, the aircraft industry has led California employment rolls. So important has this phase become that the state department of employment recently established a central aircraft placement bureau in the Los Angeles area, where most of the factories are located. The bureau draws heavily on skilled workers from all parts of the state.

Capacity Enrollments

California educational institutions are playing an important part in the program of creating wings for defense. With capacity enrollments, the University of California, the California Institute of Technology, the Aerodynamics laboratory, at Stanford, and the vocational departments of several junior colleges are turning out graduates who go to the aircraft plants as engineers and technicians.

The six California companies now principally engaged in rushing military orders are Consolidated Aircraft; Douglas Aircraft, of Santa Monica; Lockheed Aircraft, of Burbank; North American Aviation, of Inglewood; Northrup Aircraft, of Hawthorne, and Vultee Aircraft, of Downey.

Speed Accessory Work

In addition, there are many smaller companies manufacturing vital accessories. By speeding their part of the work, these smaller companies gradually are eliminating one of the "bottlenecks" in the industry.

San Diego aircraft firm officials report the aircraft factories here have taken on employes at the rate of more than 600 a month since Jan. 1, for a total of 3214 to date. The backlog of unfilled orders is reported to be nearly $73,000,000, with consolidated having approximately $70,000,000, Ryan, $1,500,000 and Solar, $1,250,000.

Longer Work Week Approved By President of Consolidated

Trib. 6/11/40

A longer work week for the aviation industry to speed up production is urged by Maj. Reuben H. Fleet, president of the Consolidated Aircraft Corp. here. Fleet, now in the east, spoke last night at the Buffalo Aero club banquet and said the United States could "accelerate" plane deliveries "by increasing the work week to include a full working day on Saturday," The Associated Press reported.

He also said 684 men are working at the Fleet Aircraft Co.'s plant at Fort Erie, Ont., and that he saw there 13 planes ready for delivery to the Royal Canadian air force.

Another speaker, Earl R. Southee, of New York, a flying specialist for the civil aeronautics authority, stressed that the CAA program for training college students "is still a civilian program, although it has military significance." He said its goal is to produce 45,000 pilots by next spring.

Consolidated Aircraft Corp. at present is on the 40-hour work week, with three shifts employed during a 24-hour period. An official of the firm said today this schedule is being maintained "until the government wants to permit a 48-hour work week."

Advertising Budgets for 1940 Aviation

ALICE ROGERS HAGER

A SUBSTANTIAL slice of media revenue is at last coming from aviation. After a spotty history, certain momentous happenings within the past two years have made the industry acutely advertising conscious. These are principally the war, on the one hand, which has put enough money into manufacturers' backlogs to pull them out of red ink, and the creation by Act of Congress in 1938 of the Civil Aeronautics Authority, which has made the transport companies sufficiently secure in their future planning to help them guarantee their commitments; and from a public attention standpoint, has aided in achieving the magnificent safety record of an entire year's flying without a single passenger fatality. It is no secret that these are boom times in the American air industry.

It is significant, to quote but one example, that American Airlines has just announced that its net profit for 1939 was $4.84 a share as against 76¢ in 1938.

It is significant, too, that in 1939, for the first time, the Air Transport Association was able to get its members to decide on a joint advertising program and to appropriate $300,000 for that purpose. The successful "It Pays To Fly" campaign being conducted by Erwin, Wasey & Company is now going on in many leading magazines and newspapers and will undoubtedly be continued for some time to come.

1930s IN REVIEW

Although this is not an historical treatise, it is worth noting that as far back as 1930, John Stewart, now chief of the press section of the Authority, who was then with Erwin, Wasey, tried to inaugurate a similar campaign and found that the industry had to be convinced it must go to the general public, which knew nothing at all about flying rather than to the aviation enthusiasts. As late as 1934, for example, there was not a single big star in Hollywood who was allowed by his or her studio to fly. By the end of 1936, new contracts being written were not only allowing it, but today, nearly the entire film capital commutes by air between the West Coast and the East.

The copy employed by the major airlines is governed by certain unwritten restrictions. These restrictions have been built up from a careful study of the effects caused by certain types of advertising copy on the prospective air traveler, and they act as an involuntary censure with the best results for the industry.

For instance, if a sum of money is placed in a campaign calling attention to last year's safety record or the general safety of airlines, a crash will decrease the psychological advantage gained from the advertising. For this reason, the airlines have majored in campaigns which show the convenience, comfort, and great saving of time accompanying air travel. It is not because they do not have the statistics to prove the safety of air travel, but rather because it is wiser not to dwell on these facts. There are hazards involved in the everyday routine of crossing the street on foot, but attention is not called to the fact because walking is a necessity and an accepted means of modern transportation. The same caution is exercised in the air as on foot.

The airlines, as a rule, do not picture high mountains in their ads because accidents a few years ago were caused by transports crashing into mountain peaks. The airlines could point now to the fact that a device has been perfected—the static suppressor—which eliminates this

---

FRENCH SURRENDER TO SPEED PLANE PRODUCTION FOR U. S.

UNION – 6-18-40

LOS ANGELES, June 17 (A.P.)—Accelerated production of American military aircraft was anticipated today by officials of rapidly-expanding southern California factories as the result of French surrender. Executives of the five largest plane plants would not comment for publication—in line with strict censorship of war activities ordered several months ago—but privately opinion was expressed that army and navy defense speed-up would be felt quickly.

Millions of dollars of unfilled orders are affected by a British announcement that it would take over French purchases in this country. Available data on the status of foreign orders in the plants involved disclosed the following situation:

Douglas Aircraft Co., which has increased its program by adding 1000 employes a week for several months, has unfilled orders exceeding $140,000,000, of which a spokesman said "more than 60 percent is military." The latest French order approximated $20,000,000.

Consolidated Aircraft Corp. is, for the present, following its schedule without change in the production of military planes for the U. S. government, Maj. R. H. Fleet, president, said last night. He said the plant stands ready to go on a six-day production week, but that purchasers have not been willing to pay the required time-and-a-half for overtime.

230 CRAFT DELIVERED

North American Aviation Co. has delivered an order of about $8,000,000 for 230 French military training planes and now is working on similar contract. Four hundred British training ships have been delivered in Canada and 600 more are in production. The two orders total about $24,000,000.

What may happen to a $1,700,000 Lockheed commercial order for 17 Lodestars to three French private airlines, Air France, Air Afrique and Aeromartime, is problematical. Lockheed's Allied military contracts are all for Britain, totaling about $70,000,000.

Northrop Aircraft, Inc., notified that the Norwegian government today deposited $1,500,000 in a New York bank in full payment for 24 patrol bombers ordered before the German invasion, said the Norwegian government has given assurance "it is still in the fight with a determination to win."

PROGRAM EXPANDED

Vultee Aircraft simultaneously announced expansion of its production program to provide two shifts of 58 hours weekly and said 150 to 200 workers would be added weekly to its present payroll of 3000. Vultee's chief contracts are one of $4,000,000 for 300 basic training planes for the U. S. army and another of $9,000,000 for 144 new pursuit ships for Sweden.

In Seattle the Boeing Aircraft Co. announced the situation in France would make no difference in its contracts with the Anglo - French purchasing commission for $25,000,000 worth of two-engined bombers, and that work will continue as planned.

British to Get French Orders

NEW YORK, June 17 (A.P.)—On the "reasonable supposition" that the British will buy all aircraft ordered by France from the United States, it was indicated today that 3280 military planes being turned out by American factories on the French orders will go to the British army.

The "supposition" that the Birtish will take over the French orders eminated from a spokesman for the Anglo-French purchasing board, who said the French had ceased placing new orders in the United States pending "clarification" of the French position.

Figures on the number of planes ordered by France came from other sources, which asserted 1570 American-made fighting planes already had been delievered to France.

A reliable authority said the British already had received "a substantial portion" of 4600 planes they have ordered from the United States in the last 18 months.

The deliveries to France, thus far, were listed as follows: 200 Douglas bombers, 600 Curtiss pursuits, 280 Martin bombers, 40 Vought-Sikorsky bombers, 450 North American Aviation trainers.

French orders which have not been delivered were given as: 120 four-engined Consolidated land bombers, 110 Consolidated patrol-boat bombers, 80 Grumman fighters, 750 Douglas bombers, 600 Martin bombers, 1200 Curtiss pursuits, 400 North American trainers.

Suspect Sabotage At Northrup Plant

Trib. 5/30

HAWTHORNE, Calif., May 30 (I.N.S.)—In what police called possible sabotage directed at the Northrop Aircraft Corp. factory in Hawthorne, main power lines supplying the plant with electricity were cut early today, according to police. Sgt. E. J. Parker telephoned Deputy Sheriff Lew Davies that some one had wielded a hacksaw on a main pole switch.

The company has a new million-dollar factory and is building parts for the Consolidated Aircraft Corp. at San Diego.

No Move to Texas, Says Consolidated

Trib.-6-8-40

Consolidated Aircraft Corp. officials yesterday flatly denied a report from Dallas, Tex., that the Consair plant would be moved to the nation's interior.

The Associated Press stated that the Times - Herald of Dallas said it learned from a reliable source that plans were under way to establish at Dallas a plane-making (Lockheed) plant and for the moving from San Diego to the shores of a lake near Dallas of one of the nation's greatest airplane factories, the Consolidated Corp.

The Times-Herald continued:

"Negotiations have been under way for some time, it was reported, to bring Lockheed here and final negotiations are pending passage of legislation now before congress.

"It was understood that the entire San Diego facilities of the Consolidated company will be moved into the nation's interior to conform with an existing plan to remove such vital defense centers from vulnerable coast lines."

"We request that you deny the rumor about Consolidated's moving," said a Consair spokesman.

Consolidated, now employing more than 5000, moved to San Diego from Buffalo in 1935. It is manufacturing army and navy planes, and is in the process of a huge plant expansion.

AIRCRAFT NEWS

6/6/40

CONSOLIDATED TO HAVE HUGE PLANE FACTORY

Consolidated Aircraft Corporation's present expansion program, now being rushed to completion with full manufacturing facilities estimated as completed by August 1, brings this plant into full alignment with the President's recently announced emergency defense program for building a vastly expanded number of aircraft. When completed, Consolidated Aircraft Corporation will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,000 square feet of contiguous airport land under option for further expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

Consolidated Aircraft Corporation is unique in its possession of most favorable conditions surrounding its ascendancy as the largest aircraft plant in America.

The greater preponderance of its backlog now noted at over $70,000,000 consists of United States government work, with a smaller proportion of its contracts for foreign deliveries, leaving the company relatively free from any contingencies which might arise over the turn of events abroad.

In undertaking its present plant expansion to enable it to meet this volume of business, a closing agreement was entered into between Consolidated Aircraft Corporation and the United States Treasury Department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

Through the naturally equitable climate of San Diego, site of the huge plant, fully 30 per cent of the manufacturing operations in building airplanes may be conducted out of doors. Provision has been made for this by paving the entire plant yard area and providing suitable outlets for power lines, etc., thus giving exceptional flexibility in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. Taking as an arbitrary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent of spares furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World War period. Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other U. S. manufacturers combined.

As early as 1934, six Consolidated P2Y-1 twin-engined flying boats in the service of the U. S. Navy flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop.

Phenomenal success followed the current Model 28's, or U. S. Navy PBY's, the larger twin-engined flying boats. With these planes scarcely off the line the U. S. Navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Anotner 88 in groups of from 18 to 18 at a time have been flown non-stop from San Diego to Coco Solo in the Canal Zone, a distance of 3087 miles. Aboard these planes were some 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29, a huge four-engined craft built for the U. S. Navy and the Model 31, a twin-engined flying boat boasting the first two radial air-cooled engines of 2000 horsepower each ever to be installed in an airplane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the U. S. Army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States Army Air Corps recently stated, "This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb carrying capacity of approximately four tons."

Union, 6/26/4

Consair Faces Record Backlog

$50,000,000 More In Orders Expected

By HOWARD MORIN

Consolidated Aircraft Corp. officials announced yesterday the backlog of the municipal airport plant is expected to reach $120,000,000 by Aug. 1. This is in conformity with the nation's tremendous national defense expansion program.

The current backlog is $70,000,000. Negotiations are under way for $50,000,000 in additional contracts for long-range patrol bombers for the army and navy. Already the largest integrated aircraft plant in America, Consair plans to add more buildings to those nearing completion. Details of the new structures are being worked out.

How events in Europe have affected Consolidated is graphically illustrated by the expansion program of the last 12 months. On July 1, 1939, the total personnel employed was 1129. Yesterday the total reached 6965. Two hundred are being employed each week with a maximum of 10,000 set for Aug. 1,

Consair Faces $120,000,000 Record Backlog

(Continued from Page 1)

the day the new $2,000,000 construction program will be completed.

Last March 6 the backlog of Consolidated was $49,000,000, sufficient to keep the plant operating until late 1941. The total number of men employed was 4300. Working three eight-hour shifts daily the factory will have sufficient contracts to keep it toiling around the clock until 1942 and possibly longer, officials say. Before Hitler began his march through Europe the maximum number employed at Consolidated was 3875.

MORE EXPANSION

The plant occupies 1,910,000 square feet of covered and uncovered manufacturing space. Under option from the harbor department are 954,440 square feet of municipal airport property, part of which is expected to be utilized within the next few months for construction of another assembly building exceeding 300 feet in length.

The magnitude of the expansion program which will be completed within another month is illustrated by the size of some of the buildings. The storage shed is 1000 feet long and covers 30,000 square feet of space.

The final assembly building is 700 feet long and 360 feet wide. Its huge doors each will be 120 feet long, which gives some idea of the tremendous wing spread of the new bombers soon to be added to the nation's sky fleets. The ground floor of this structure covers 259,200 square feet, the first and second mezzanine floors each 7200 square feet and the bonded stockroom 8000 square feet, a total of 281,600.

OTHER BUILDING

The experimental building annex covers 38,000 square feet. Other structures include a final finish building, office building, addition to the paint shop, boiler house and hull and wing department.

Consolidated is said to be the only aircraft plant in the world where construction work can be carried out in areas unprotected by roofing. Thirty percent of the manufacturing operations may be conducted out of doors at least nine months of the year. Provision has been made for this by paving the entire plant yard area, providing suitable outlets for power lines, thus giving exceptional flexibility to the plant in its construction and expansion program.

Since Consolidated moved here from Buffalo, N.Y., it has become the world's largest manufacturer of flying boats. The company, founded in 1923, has built four times as many airboats as all other U.S. manufacturers combined.

BOMBERS FOR ARMY

Re-entry of Consolidated into the land plane field was marked by the construction, testing and acceptance by the army of the four-engied bomber classified as the XB-23, whose gross weight exceeds 20 tons. It has a speed exceeding 300 miles an hour and a flight range of 3500 miles carrying four tons of bombs. The navy's new long-range offshore patrol bombers are just as fast and as heavily armed.

The Consolidated plant, with the completion of the final assembly building, extends for half a mile on Pacific highway. It is heavily guarded and extraordinary precautions are being taken to prevent sabotage and pilferage of plans of not only existing models but larger and more powerful bombers now on the drafting boards.

In a statement to stockholders last month Maj. Reuben H. Fleet, Consolidated president, gave an inkling of the company's Aug. 1 backlog when he said it would exceed $100,000,000 of "outstanding quotations were accepted." The report at the factory is that the negotiations are virtually completed.

UNION 6-30 '40

5 Aircraft Employes Made Special Officers

At the request of Clifford E. Peterson, police chief, deputies of Fred Sick, city clerk, have sworn in five aircraft company employes as special police officers who will serve without pay from the city.

They are: William H. Shattuck and George Roth, Consolidated Aircraft Corp., and Al M. Gee, C. F. Bennett and E. E. Schindler, Ryan Aeronautical Co.

Tribune, June 26, '40

New Consair Contracts Pending; $100,000,000 Backlog Anticipated

With a current "firm" backlog of more than $70,000,000 in orders for military planes, Consolidated Aircraft Corp. officials today said that "prospects were bright" that this would be increased to somewhere around $100,000,000 "in the near future."

Negotiations for additional army and navy contracts for long-range patrol bombers are under way at Washington, D. C. Increases in Consair's backlog are contingent upon the outcome of these parleys, company spokesmen said.

These spokesmen explained that the $100,000,000 figure was not to be construed as a ceiling upon possible future orders but that the eventual figure might exceed that amount "substantially."

Consolidated, famous as the manufacturers of the PBY patrol bombers which the navy for several years has used successfully in spectacular transocean mass flights, is known to be developing several new types for the army and navy that are expected to contribute much to the nation's current defense program. A recent development was a four-motored land plane which underwent tests here for the army.

Nearly-completed additions to the huge Consair plant virtually will double its capacity, making it the largest integrated aircraft manufacturing plant in the United States, and further expansion is planned.

Working night and day to rush the government's orders to completion today were 7000 employes and it was expected that 10,000 would be employed at the plant at the peak of production.

'Too Busy To Celebrate'

MAJ. R. H. FLEET

Trib. - 5/29

GROWTH RELATED AS CONSOLIDATED 17 YEARS OLD

"In some respects, I am sorry we are too busy to celebrate."

With these words, Maj. R. H. Fleet, Consolidated Aircraft Corp. president, concluded a memorandum to employes announcing that today marks the 17th anniversary of the huge aircraft firm.

In 1923 Fleet and his oldest associates recalled, the company was located in a small plant in Buffalo, N. Y., and employed 25 workers.

Today, 6014 employes were rushing to fill warplane orders of the United States and foreign governments totaling $70,000,000, the largest backlog in company history, marking it as one of the largest aircraft manufacturing concerns in the nation.

Expansion Under Way

Also under way was a plant expansion program which, when completed, will double the present capacity and cover 1,910,000 square feet of covered and open-air working space, making the plant the largest integrated plane-building factory in the United States, company spokesmen pointed out.

With the federal government embarked on a gigantic defense program and with world history hinging on armament production, Consair authorities predicted that new rush orders for this and other governments will, in the near future, raise the backlog figure to a still more stupendous total.

Since the firm moved to San Diego in October, 1935, it has produced upwards of 200 of the famed Model 28 PBY patrol bomber flying boats for the navy. These are the ships which participated in several spectacular transocean mass flights in recent years.

Guba Consair Product

The Guba, plane of Richard Archbold, American Museum of Natural History explorer, which last year made a record-setting flight around the world, and the plane in which Sir Hubert Wilkins encircled the north pole both were modifications of Model 28.

In addition, Consair has produced several experimental models for commercial and military use, including the newest four-motored 'flying fortress" now in the hands of the United States army. Also flown from the production line were 50 two-seater pursuit planes for the army.

When Consair first was organized, it specialized in production of the famed Fleet trainer, small two-place biplane, in which many of the nation's top-flight pilots learned to fly. hazard, but the mere mention of such a device would only recall unpleasant memories.

To inject power into their campaigns, the airlines are attempting to show that it actually does pay to fly. To carry this idea further they have utilized testimonials of famous people who have flown and are convinced that it does pay to fly, and that it is more comfortable and convenient than other forms of transportation. From surveys it has been discovered that nine out of ten people who fly for the first time continue to use this method of transportation whenever possible. The campaigns of the respective airlines have been aimed at persuading land bound people to travel by air *once*—and let the airplane sell its own safety record and advantages.

This may seem an elementary point, but it is the foundation of any advertising program that is going to be either acceptable or that will achieve sales. The year 1940 is going to see all advertising budgets boosted in keeping with traffic increases. Herewith is a review of latest advertising.

In the international sphere, Pan American Airways, of course, stands as sole representative of the United States, and its 12-year record of expansion into Central and South America, across the Pacific and Atlantic and into Alaska is common knowledge. Its fleet now numbers 135, with several million dollars worth of new and highly improved type of ships now building at the factories. Its program for 1940 is to be conducted in two partially overlapping phases, a system-selling or institutional campaign and a specific traffic promotion or sales campaign. The first institutional advertisements were scheduled to break in the *Saturday Evening Post* of April 10, *Time* of April 11 and *Collier's* of April 12. These are four-color, bleed spreads, each different. They will be followed by a series of single page, four-color ads in the same publications, plus *Newsweek* and *National Geographic*, a total of 20 pages. A simultaneous and coordinated program of 10 single-page, four-color ads will be run by Pan American Grace Airways, the company's South American west coast unit, in *Time*, *Newsweek* and *National Geographic*.

The company's sales campaign will be timed to start approximately six weeks before promised delivery of the new planes when increased service will be available. This will embrace a list of leading class magazines and key newspapers, the space in the former to be chiefly one column black and white, and that in the newspapers to be governed by the size of their markets in relation to Pan American's potential traffic from them. Approximately 60 per cent of the company's budget will go to these outlets, the remainder being divided as shown in table.

Campaign Schedule	*Per Cent*
National advertising campaigns	56%
Trade publications—express service	2%
Trade publications—passenger service	3%
Miscellaneous publication advertising	5%
General travel literature	7%
Tour and special travel literature	4.5%
Semi-permanent window displays	3.5%
Temporary window displays	2%
Plane models, Exposition booths, etc.	1.5%
Agents helps, novelty items, etc.	1%
Special airmail promotion	2%
Participation in passenger and express advertising campaigns of Air Transport Association and other cooperative projects	7%
Miscellaneous	4.5%
	100%

The bulk of the company's space advertising is placed through Batten, Barton, Durstine and Osborn, although other agencies are used for some parts of the program. The bulk of its printed and display material is produced through its own advertising department.

DOMESTIC PICTURE

On the domestic side, the new awareness of the advertising field is exemplified by increased budgets that match last year's traffic increases. United Airlines, oldest of the transcontinentals, whose vice-president, Harold Crary, was one of the moving spirits in putting across the ATA joint program, has announced a 33 per cent increase over last year, to be given to 110 metropolitan newspapers, most of them in on-line cities. The total appropriation is $375,000, with an unannounced portion going to general magazines of national circulation and some experimental ads being run in key publications in special fields. N. W. Ayer handles the account. Special attention is to be paid to vacation business, with the two world's fairs as well as the great recreation areas in between getting heavy emphasis.

Eastern Airlines is planning the use of half and quarter pages in 73 newspapers throughout its system for special announcement of its overnight sleeper plane service between New York and the Mexican border, where it connects with the three-hour Pan American service to Mexico City. Full pages are being taken in Mexico [*Continued on page 92*]

FRENCH SURRENDER TO SPEED PLANE PRODUCTION FOR U. S.

UNION - 6-18-40

LOS ANGELES, June 17 (A.P.)—Accelerated production of American military aircraft was anticipated today by officials of rapidly-expanding southern California factories as the result of French surrender. Executives of the five largest plane plants would not comment for publication—in line with strict censorship of war activities ordered several months ago—but privately opinion was expressed that army and navy defense speed-up would be felt quickly.

Millions of dollars of unfilled orders are affected by a British announcement that it would take over French purchases in this country. Available data on the status of foreign orders in the plants involved disclosed the following situation:

Douglas Aircraft Co., which has increased its program by adding 1000 employes a week for several months, has unfilled orders exceeding $140,000,000, of which a spokesman said "more than 60 percent is military." The latest French order approximated $20,000,000.

Consolidated Aircraft Corp. is, for the present, following its schedule without change in the production of military planes for the U. S. government, Maj. R. H. Fleet, president, said last night. He said the plant stands ready to go on a six-day production week, but that purchasers have not been willing to pay the required time-and-a-half for overtime.

230 CRAFT DELIVERED

North American Aviation Co. has delivered an order of about $8,000,000 for 230 French military training planes and now is working on similar contract. Four hundred British training ships have been delivered in Canada and 600 more are in production. The two orders total about $24,000,000.

What may happen to a $1,700,000 Lockheed commercial order for 17 Lodestars to three French private airlines, Air France, Air Afrique and Aeromartime, is problematical. Lockheed's Allied military contracts are all for Britain, totaling about $70,000,000.

Northrop Aircraft, Inc., notified that the Norwegian government today deposited $1,500,000 in a New York bank in full payment for 24 patrol bombers ordered before the German invasion, said the Norwegian government has given assurance "it is still in the fight with a determination to win."

PROGRAM EXPANDED

Vultee Aircraft simultaneously announced expansion of its production program to provide two shifts of 58 hours weekly and said 150 to 200 workers would be added weekly to its present payroll of 3000. Vultee's chief contracts are one of $4,000,000 for 300 basic training planes for the U. S. army and another of $9,000,000 for 144 new pursuit ships for Sweden.

In Seattle the Boeing Aircraft Co. announced the situation in France would make no difference in its contracts with the Anglo - French purchasing commission for $25,000,000 worth of two-engined bombers, and that work will continue as planned.

British to Get French Orders

NEW YORK, June 17 (A.P.)—On the "reasonable supposition" that the British will buy all aircraft ordered by France from the United States, it was indicated today that 3280 military planes being turned out by American factories on the French orders will go to the British army.

The "supposition" that the Birtish will take over the French orders eminated from a spokesman for the Anglo-French purchasing board, who said the French had ceased placing new orders in the United States pending "clarification" of the French position.

Figures on the number of planes ordered by France came from other sources, which asserted 1570 American-made fighting planes already had been delievered to France.

A reliable authority said the British already had received "a substantial portion" of 4600 planes they have ordered from the United States in the last 18 months.

The deliveries to France, thus far, were listed as follows: 200 Douglas bombers, 600 Curtiss pursuits, 280 Martin bombers, 40 Vought-Sikorsky bombers, 450 North American Aviation trainers.

French orders which have not been delivered were given as: 120 four-engined Consolidated land bombers, 110 Consolidated patrol-boat bombers, 80 Grumman fighters, 750 Douglas bombers, 600 Martin bombers, 1200 Curtiss pursuits, 400 North American trainers.

Trib. 5/30

Suspect Sabotage At Northrup Plant

HAWTHORNE, Calif., May 30 (I.N.S.)—In what police called possible sabotage directed at the Northrop Aircraft Corp. factory in Hawthorne, main power lines supplying the plant with electricity were cut early today, according to police. Sgt. E. J. Parker telephoned Deputy Sheriff Lew Davies that some one had wielded a hacksaw on a main pole switch.

The company has a new million-dollar factory and is building parts for the Consolidated Aircraft Corp. at San Diego.

Trib.-6-8-40

No Move to Texas, Says Consolidated

Consolidated Aircraft Corp. officials yesterday flatly denied a report from Dallas, Tex., that the Consair plant would be moved to the nation's interior.

The Associated Press stated that the Times - Herald of Dallas said it learned from a reliable source that plans were under way to establish at Dallas a plane-making (Lockheed) plant and for the moving from San Diego to the shores of a lake near Dallas of one of the nation's greatest airplane factories, the Consolidated Corp.

The Times-Herald continued:

"Negotiations have been under way for some time, it was reported, to bring Lockheed here and final negotiations are pending passage of legislation now before congress.

"It was understood that the entire San Diego facilities of the Consolidated company will be moved into the nation's interior to conform with an existing plan to remove such vital defense centers from vulnerable coast lines."

"We request that you deny the rumor about Consolidated's moving," said a Consair spokesman.

Consolidated, now employing more than 5000, moved to San Diego from Buffalo in 1935. It is manufacturing army and navy planes, and is in the process of a huge plant expansion.

AIRCRAFT NEWS

6/6/40

CONSOLIDATED TO HAVE HUGE PLANE FACTORY

Consolidated Aircraft Corporation's present expansion program, now being rushed to completion with full manufacturing facilities estimated as completed by August 1, brings this plant into full alignment with the President's recently announced emergency defense program for building a vastly expanded number of aircraft. When completed, Consolidated Aircraft Corporation will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,000 square feet of contiguous airport land under option for further expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

Consolidated Aircraft Corporation is unique in its possession of most favorable conditions surrounding its ascendancy as the largest aircraft plant in America.

The greater preponderance of its backlog now noted at over $70,000,000 consists of United States government work, with a smaller proportion of its contracts for foreign deliveries, leaving the company relatively free from any contingencies which might arise over the turn of events abroad.

In undertaking its present plant expansion to enable it to meet this volume of business, a closing agreement was entered into between Consolidated Aircraft Corporation and the United States Treasury Department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

Through the naturally equitable climate of San Diego, site of the huge plant, fully 30 per cent of the manufacturing operations in building airplanes may be conducted out of doors. Provision has been made for this by paving the entire plant yard area and providing suitable outlets for power lines, etc., thus giving exceptional flexibility in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. Taking as an arbitrary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent of spares furnished, Consolidated has constructed more than three times as many such airplanes as all other manufacturers combined. This includes those built during the World War period. Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other U. S. manufacturers combined.

As early as 1934, six Consolidated P2Y-1 twin-engined flying boats in the service of the U. S. Navy flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop.

Phenomenal success followed the current Model 28's, or U. S. Navy PBY's, the larger twin-engined flying boats. With these planes scarcely off the line the U. S. Navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Anotner 88 in groups of from 18 to 18 at a time have been flown non-stop from San Diego to Coco Solo in the Canal Zone, a distance of 3087 miles. Aboard these planes were some 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29, a huge four-engined craft built for the U. S. Navy and the Model 31, a twin-engined flying boat boasting the first two radial air-cooled engines of 2000 horsepower each ever to be installed in an airplane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the U. S. Army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States Army Air Corps recently stated, "This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb carrying capacity of approximately four tons."

Tribune, June 26, '40

New Consair Contracts Pending; $100,000,000 Backlog Anticipated

With a current "firm" backlog of more than $70,000,000 in orders for military planes, Consolidated Aircraft Corp. officials today said that "prospects were bright" that this would be increased to somewhere around $100,000,000 "in the near future."

Negotiations for additional army and navy contracts for long-range patrol bombers are under way at Washington, D. C. Increases in Consair's backlog are contingent upon the outcome of these parleys, company spokesmen said.

These spokesmen explained that the $100,000,000 figure was not to be construed as a ceiling upon possible future orders but that the eventual figure might exceed that amount "substantially."

Consolidated, famous as the manufacturers of the PBY patrol bombers which the navy for several years has used successfully in spectacular transocean mass flights, is known to be developing several new types for the army and navy that are expected to contribute much to the nation's current defense program. A recent development was a four-motored land plane which underwent tests here for the army.

Nearly-completed additions to the huge Consair plant virtually will double its capacity, making it the largest integrated aircraft manufacturing plant in the United States, and further expansion is planned.

Working night and day to rush the government's orders to completion today were 7000 employes and it was expected that 10,000 would be employed at the plant at the peak of production.

Union, 6/26/4

Consair Faces Record Backlog

$50,000,000 More In Orders Expected

By HOWARD MORIN

Consolidated Aircraft Corp. officials announced yesterday the backlog of the municipal airport plant is expected to reach $120,000,000 by Aug. 1. This is in conformity with the nation's tremendous national defense expansion program.

The current backlog is $70,000,000. Negotiations are under way for $50,000,000 in additional contracts for long-range patrol bombers for the army and navy. Already the largest integrated aircraft plant in America, Consair plans to add more buildings to those nearing completion. Details of the new structures are being worked out.

How events in Europe have affected Consolidated is graphically illustrated by the expansion program of the last 12 months. On July 1, 1939, the total personnel employed was 1129. Yesterday the total reached 6965. Two hundred are being employed each week with a maximum of 10,000 set for Aug. 1,

Consair Faces $120,000,000 Record Backlog

(Continued from Page 1)

the day the new $2,000,000 construction program will be completed.

Last March 6 the backlog of Consolidated was $49,000,000, sufficient to keep the plant operating until late 1941. The total number of men employed was 4300. Working three eight-hour shifts daily the factory will have sufficient contracts to keep it toiling around the clock until 1942 and possibly longer, officials say. Before Hitler began his march through Europe the maximum number employed at Consolidated was 3875.

MORE EXPANSION

The plant occupies 1,910,000 square feet of covered and uncovered manufacturing space. Under option from the harbor department are 954,440 square feet of municipal airport property, part of which is expected to be utilized within the next few months for construction of another assembly building exceeding 300 feet in length.

The magnitude of the expansion program which will be completed within another month is illustrated by the size of some of the buildings. The storage shed is 1000 feet long and covers 30,000 square feet of space.

The final assembly building is 700 feet long and 360 feet wide. Its huge doors each will be 120 feet long, which gives some idea of the tremendous wing spread of the new bombers soon to be added to the nation's sky fleets. The ground floor of this structure covers 259,200 square feet, the first and second mezzanine floors each 7200 square feet and the bonded stockroom 8000 square feet, a total of 281,600.

OTHER BUILDING

The experimental building annex covers 38,000 square feet. Other structures include a final finish building, office building, addition to the paint shop, boiler house and hull and wing department.

Consolidated is said to be the only aircraft plant in the world where construction work can be carried out in areas unprotected by roofing. Thirty percent of the manufacturing operations may be conducted out of doors at least nine months of the year. Provision has been made for this by paving the entire plant yard area, providing suitable outlets for power lines, thus giving exceptional flexibility to the plant in its construction and expansion program.

Since Consolidated moved here from Buffalo, N.Y., it has become the world's largest manufacturer of flying boats. The company, founded in 1923, has built four times as many airboats as all other U.S. manufacturers combined.

BOMBERS FOR ARMY

Re-entry of Consolidated into the land plane field was marked by the construction, testing and acceptance by the army of the four-engied bomber classified as the XB-23, whose gross weight exceeds 20 tons. It has a speed exceeding 300 miles an hour and a flight range of 3500 miles carrying four tons of bombs. The navy's new long-range offshore patrol bombers are just as fast and as heavily armed.

The Consolidated plant, with the completion of the final assembly building, extends for half a mile on Pacific highway. It is heavily guarded and extraordinary precautions are being taken to prevent sabotage and pilferage of plans of not only existing models but larger and more powerful bombers now on the drafting boards.

In a statement to stockholders last month Maj. Reuben H. Fleet, Consolidated president, gave an inkling of the company's Aug. 1 backlog when he said it would exceed $100,000,000 of "outstanding quotations were accepted." The report at the factory is that the negotiations are virtually completed.

5 Aircraft Employes Made Special Officers

At the request of Clifford E. Peterson, police chief, deputies of Fred Sick, city clerk, have sworn in five aircraft company employes as special police officers who will serve without pay from the city.

They are: William H. Shattuck and George Roth, Consolidated Aircraft Corp., and Al M. Gee, C. F. Bennett and E. E. Schindler, Ryan Aeronautical Co.

'Too Busy To Celebrate'

MAJ. R. H. FLEET

Trib. - 5/29

GROWTH RELATED AS CONSOLIDATED 17 YEARS OLD

"In some respects, I am sorry we are too busy to celebrate."

With these words, Maj. R. H. Fleet, Consolidated Aircraft Corp. president, concluded a memorandum to employes announcing that today marks the 17th anniversary of the huge aircraft firm.

In 1923 Fleet and his oldest associates recalled, the company was located in a small plant in Buffalo, N. Y., and employed 25 workers.

Today, 6014 employes were rushing to fill warplane orders of the United States and foreign governments totaling $70,000,000, the largest backlog in company history, marking it as one of the largest aircraft manufacturing concerns in the nation.

Expansion Under Way

Also under way was a plant expansion program which, when completed, will double the present capacity and cover 1,910,000 square feet of covered and open-air working space, making the plant the largest integrated plane-building factory in the United States, company spokesmen pointed out.

With the federal government embarked on a gigantic defense program and with world history hinging on armament production, Consair authorities predicted that new rush orders for this and other governments will, in the near future, raise the backlog figure to a still more stupendous total.

Since the firm moved to San Diego in October, 1935, it has produced upwards of 200 of the famed Model 28 PBY patrol bomber flying boats for the navy. These are the ships which participated in several spectacular transocean mass flights in recent years.

Guba Consair Product

The Guba, plane of Richard Archbold, American Museum of Natural History explorer, which last year made a record-setting flight around the world, and the plane in which Sir Hubert Wilkins encircled the north pole both were modifications of Model 28.

In addition, Consair has produced several experimental models for commercial and military use, including the newest four-motored 'flying fortress" now in the hands of the United States army. Also flown from the production line were 50 two-seater pursuit planes for the army.

When Consair first was organized, it specialized in production of the famed Fleet trainer, small two-place biplane, in which many of the nation's top-flight pilots learned to fly. Later, while still located at Buffalo, it entered the flying boat field, turning out several types for the navy and the 15 Commodores used in the first United States-Argentina commercial run.

In his memorandum pointing to the growth of the company, Fleet stated:

"Today we are in a factory of our own, tailored to our business and located in the city of our choice."

Consair authorities pointed out that, by coincidence, the number of employes passed the 6000-mark on the company's anniversary today.

THE TRIBUNE-SUN, San Diego, Calif., Tuesday, June 11, 1940

California Aircraft Industry Leads In Drive To Complete U. S. Defenses

With colleges and technical schools turning out more and more skilled men and factory payrolls increasing weekly, California's aircraft industry today was in the vanguard of the drive to carry out President Roosevelt's defense armament program, The International News Service reported from Los Angeles.

Agreeing that the aerial phase of the program is an "all-California job," heads of six of America's leading plane companies located in California, including Consolidated Aircraft Corp., at San Diego, have pledged their resources to doing the job set for the industry by the president's plan for 50,000 planes.

The California aircraft industry now employs more than 33,000 workers, and has an annual payroll, constantly rising, which now stands at more than $50,000,000. For many months, figures show, the aircraft industry has led California employment rolls. So important has this phase become that the state department of employment recently established a central aircraft placement bureau in the Los Angeles area, where most of the factories are located. The bureau draws heavily on skilled workers from all parts of the state.

Capacity Enrollments

California educational institutions are playing an important part in the program of creating wings for defense. With capacity enrollments, the University of California, the California Institute of Technology, the Aerodynamics laboratory, at Stanford, and the vocational departments of several junior colleges are turning out graduates who go to the aircraft plants as engineers and technicians.

The six California companies now principally engaged in rushing military orders are Consolidated Aircraft; Douglas Aircraft, of Santa Monica; Lockheed Aircraft, of Burbank; North American Aviation, of Inglewood; Northrup Aircraft, of Hawthorne, and Vultee Aircraft, of Downey.

Speed Accessory Work

In addition, there are many smaller companies manufacturing vital accessories. By speeding their part of the work, these smaller companies gradually are eliminating one of the "bottlenecks" in the industry.

San Diego aircraft firm officials report the aircraft factories here have taken on employes at the rate of more than 600 a month since Jan. 1, for a total of 3214 to date. The backlog of unfilled orders is reported to be nearly $73,000,000, with consolidated having approximately $70,000,000, Ryan, $1,500,000 and Solar, $1,250,000.

Trib.
6/11/40

Longer Work Week Approved By President of Consolidated

A longer work week for the aviation industry to speed up production is urged by Maj. Reuben H. Fleet, president of the Consolidated Aircraft Corp. here. Fleet, now in the east, spoke last night at the Buffalo Aero club banquet and said the United States could "accelerate" plane deliveries "by increasing the work week to include a full working day on Saturday," The Associated Press reported.

He also said 684 men are working at the Fleet Aircraft Co.'s plant at Fort Erie, Ont., and that he saw there 13 planes ready for delivery to the Royal Canadian air force.

Another speaker, Earl R. Southee, of New York, a flying specialist for the civil aeronautics authority, stressed that the CAA program for training college students "is still a civilian program, although it has military significance." He said its goal is to produce 45,000 pilots by next spring.

Consolidated Aircraft Corp. at present is on the 40-hour work week, with three shifts employed during a 24-hour period. An official of the firm said today this schedule is being maintained "until the government wants to permit a 48-hour work week."

Check List for Summer Advertising

GEORGE BIJUR

For best results, you will build your advertising through the next few months on the facts of summertime. Warm weather is only one. Check your plans against these additional 22.

IF you go to the public library and pick up one of last August's issues of America's best known magazine, you'll find scattered through its pages about $80,000 worth of advertising that was doing only $40,000 worth of work. Ads whose effectiveness during these hot months was almost halved, because they were still huddled in winter copy clothes, wrapped in long-underwear layouts, delivering below-zero sales talks when the mercury was bubbling.

Here is a film manufacturer, for example, solemnly telling you—in August—what beautiful *snow* pictures his equipment will enable you to take. A mill trying to sell bed sheets in July, with as sombre and mid-wintery a picture as ever made you want to tuck your head under the pillow. A vacuum cleaner ad shows a thick rug on the floor, and a log crackling in the fireplace. No help here for the housewife who finds that open windows in summer are an invitation to dust, and whose summer rugs and curtains present a new kind of cleaning problem. A radio manufacturer runs five paragraphs of close-set type—but he could run that ad in December without changing a comma! Not a word to touch off the spark of summertime wants and needs, to click with what his customers are doing and thinking at the beachtime season of the year.

So it goes. By turning his back on summer, advertiser after advertiser misses the opportunity to get better reading and more enthusiastic response. The reader of the magazine may have been mopping his brow at every paragraph, but the ad might as well have been written for Eskimos.

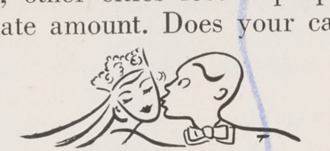
The following "Check List for Summer Advertising" is not complete by any means—but it may help the sales executive to think more concretely in terms of summer, and perhaps to remind him of a few summertime slants that might otherwise be overlooked.

1 . . . While more wedding licenses are issued in June than any other month of the year (14.1 per cent), May, July, August and September are almost as big (together they account for 36.6 per cent of the year's marriages). More furniture sales are made in August than in any other period —45 per cent more than during the average month. Are your summer promotional and advertising plans calculated to reach the hundreds of thousands of honeymooners and new-apartment renters? Many will be building their own homes, all will be starting fresh with everything from kitchen sinks to vacuum cleaners, radios to rugs, toasters to tea tables. Will your summer advertising be as helpful and informative as they want it to be? Will it have a touch of romance?

2 . . . More sales of automobiles, accessories, tires and batteries take place during the "on the road" months of July to September than during any other three-month period. Is your summer advertising full of outdoor zip and go, varied as the road-scene, fast moving and energetic?

3 . . . The three days preceding July 4 and Decoration Day are two of the peak buying periods of the year. Have you arranged for copy and layouts, displays and dealer helps, to get full benefit of holiday news interest?

4 . . . A million people leave New York City every summer week-end; other cities lose a proportionate amount. Does your campaign make the most of the needs and requirements created by America's "week-end habit"?



5 . . . Some 77 per cent of the people who regularly get a vacation take it between July 1 and Labor Day. But long before the actual "two weeks off," these people think, dream, talk vacation. Is something of the promise of vacation put to work for you in your summer advertising?

6 . . . Less money is deposited in savings banks during the summer quarter than any of the other

---

Aviation Advertising Budgets

[*Continued from page 37*]

City and Tampico papers to get return loads of tourists. Federal Advertising is Eastern's agency.

American Airlines reports a 20 per cent increase, or approximately $200,000, with a total of $800,000 to be spent. This will be concentrated in the *Saturday Evening Post, Time, Collier's* and the *New Yorker*, with about 90 per cent of its newspaper copy going to dailies. It will continue publication for its passengers of its "American Way" magazine, which has been much liked. It is also using a large number of small pamphlets for passengers of the type of its "Service Fit for a King," which was cartoon-illustrated. Its magazine ad appeal is to continue with the idea of selling what air transport can do for those using it, rather than that of telling the public of the technique of flying. Ruthrauff and Ryan carries the account.

SMALL COMPANIES ACTIVE

Two of the smaller lines have been advertisingly active. Braniff Airways, operating from Chicago to Brownsville, has played its "Portraits of an Airline" in *Time*, and has made constant use of its new slogan of the "Flying Forties." The company reports such good results from its "Portraits" that it is continuing them through the new year. Such heads as "Trade Wings to Latin America," "Southwest to Fun and Fortune" and "A Fledgling becomes a Fleet" give a rough idea of the appeal. Braniff also makes much of its college girl hostesses. Their newspaper schedule is similar to American's in that consumer benefits are emphasized. Handout material and direct mail matter are largely follow-ups on the *Time* spreads.

Chicago and Southern Airlines, which runs between Chicago and New Orleans, has analyzed its problem of integrating the necessities of a regional company with the national picture and doing it on a limited budget. It has used a spread in *Fortune*. This ad was financed cooperatively with companies selling equipment to the line and brings to the notice of chief executives throughout the country the inauguration of the company's new fleet of Douglas DC3s, in other words, luxury planes. 10,000 four-page reprints of the ad in which the line's history is included, are being mailed to airline agents and travel bureaus.

Tie-ins with advertising in the *Saturday Evening Post, Life, Collier's*, and *Liberty* were made with Sinclair Oil; Douglas Aircraft cooperated with *Time, Newsweek* and *Nation's Business*; and Shell Oil shared online newspaper space expense. In this way, the budget of $22,124 for the first six months of the year is being stretched to get the utmost in results. An additional $10,000 equivalent is made available through permission of the Civil Aeronautic Authority by trade agreements with news space and radio time by exchange of "space available" transportation with approved outlets. Since passengers designated by these outlets are only carried when there are empty seats in the planes, no loss is experienced by the airline in regular traffic sales.

On the side of the manufacturers, two of the larger companies give the statement that most of their appeal is straight to the buyer, rather than to the public. United Aircraft advertises in both national and trade magazines, using Platt and Forbes of East Hartford, Connecticut, as its representative. Its budget jump is one of the most significant of the entire group, from $78,000 in 1939 to $175,000 in 1940. This covers cost of production from layouts up, and includes an institutional campaign that is being continued. The Curtiss-Wright Corporation gives no figures but states that its budget will cover three divisions, engine, military and commercial aircraft, and propellers, with an increase of 25 per cent over 1939. Its agency is Burke, Dowling and Adams of Upper Montclair, New Jersey. It is cooperating very closely with the Air Transport Association in the air travel campaign and is beginning promotion of its new transport, a 36-passenger plane now flight testing in St. Louis.

THREE DIVISIONS

Glenn L. Martin Company in Baltimore, which builds both military and commercial craft, says of its plans: "This company's program is divided into three fields. For the domestic, we emphasize through trade papers the contributions being made by the company to the military air establishment of the United States government. For export, we use trade paper advertising of the types of military aircraft the company is manufacturing and has available for over-seas military service. Finally, for commercial transport, we are using a comprehensive campaign with four-color bleed page advertisements in a long list of leading American weeklies, stressing the peace-time contributions of the company to commercial aviation, and the future plans of the company for further contribution to over-ocean passenger transportation."

From San Diego, the Consolidated Aircraft Corporation reports: "Since our efforts over the past few years have resulted in virtual specialization on military craft for the U. S. government air forces, we have more or less restricted our advertising plan to the area of this country. Our current advertising schedule includes insertions in the national aeronautical magazines, with the single exception of one magazine entering South America."

FRENCH SURRENDER TO SPEED PLANE PRODUCTION FOR U. S.

UNION - 6-18-40

LOS ANGELES, June 17 (A.P.)—Accelerated production of American military aircraft was anticipated today by officials of rapidly-expanding southern California factories as the result of French surrender. Executives of the five largest plane plants would not comment for publication —in line with strict censorship of war activities ordered several months ago—but privately opinion was expressed that army and navy defense speed-up would be felt quickly.

Millions of dollars of unfilled orders are affected by a British announcement that it would take over French purchases in this country. Available data on the status of foreign orders in the plants involved disclosed the following situation:

Douglas Aircraft Co., which has increased its program by adding 1000 employes a week for several months, has unfilled orders exceeding $140,000,000, of which a spokesman said "more than 60 percent is military." The latest French order approximated $20,000,000.

Consolidated Aircraft Corp. is, for the present, following its schedule without change in the production of military planes for the U. S. government, Maj. R. H. Fleet, president, said last night. He said the plant stands ready to go on a six-day production week, but that purchasers have not been willing to pay the required time-and-a-half for overtime.

230 CRAFT DELIVERED

North American Aviation Co. has delivered an order of about $8,000,000 for 230 French military training planes and now is working on similar contract. Four hundred British training ships have been delivered in Canada and 600 more are in production. The two orders total about $24,000,000.

What may happen to a $1,700,000 Lockheed commercial order for 17 Lodestars to three French private airlines, Air France, Air Afrique and Aeromartime, is problematical. Lockheed's Allied military contracts are all for Britain, totaling about $70,000,000.

Northrop Aircraft, Inc., notified that the Norwegian government today deposited $1,500,000 in a New York bank in full payment for 24 patrol bombers ordered before the German invasion, said the Norwegian government has given assurance "it is still in the fight with a determination to win."

PROGRAM EXPANDED

Vultee Aircraft simultaneously announced expansion of its production program to provide two shifts of 58 hours weekly and said 150 to 200 workers would be added weekly to its present payroll of 3000. Vultee's chief contracts are one of $4,000,000 for 300 basic training planes for the U. S. army and another of $9,000,000 for 144 new pursuit ships for Sweden.

In Seattle the Boeing Aircraft Co. announced the situation in France would make no difference in its contracts with the Anglo - French purchasing commission for $25,000,000 worth of two-engined bombers, and that work will continue as planned.

British to Get French Orders

NEW YORK, June 17 (A.P.)—On the "reasonable supposition" that the British will buy all aircraft ordered by France from the United States, it was indicated today that 3280 military planes being turned out by American factories on the French orders will go to the British army.

The "supposition" that the Birtish will take over the French orders eminated from a spokesman for the Anglo-French purchasing board, who said the French had ceased placing new orders in the United States pending "clarification" of the French position.

Figures on the number of planes ordered by France came from other sources, which asserted 1570 American-made fighting planes already had been delievered to France.

A reliable authority said the British already had received "a substantial portion" of 4600 planes they have ordered from the United States in the last 18 months.

The deliveries to France, thus far, were listed as follows: 200 Douglas bombers, 600 Curtiss pursuits, 280 Martin bombers, 40 Vought-Sikorsky bombers, 450 North American Aviation trainers.

French orders which have not been delivered were given as: 120 four-engined Consolidated land bombers, 110 Consolidated patrol-boat bombers, 80 Grumman fighters, 750 Douglas bombers, 600 Martin bombers, 1200 Curtiss pursuits, 400 North American trainers.

No Move to Texas, Says Consolidated

Trib.-6-8-40

Consolidated Aircraft Corp. officials yesterday flatly denied a report from Dallas, Tex., that the Consair plant would be moved to the nation's interior.

The Associated Press stated that the Times - Herald of Dallas said it learned from a reliable source that plans were under way to establish at Dallas a plane-making (Lockheed) plant and for the moving from San Diego to the shores of a lake near Dallas of one of the nation's greatest airplane factories, the Consolidated Corp.

The Times-Herald continued:

"Negotiations have been under way for some time, it was reported, to bring Lockheed here and final negotiations are pending passage of legislation now before congress.

"It was understood that the entire San Diego facilities of the Consolidated company will be moved into the nation's interior to conform with an existing plan to remove such vital defense centers from vulnerable coast lines."

"We request that you deny the rumor about Consolidated's moving," said a Consair spokesman.

Consolidated, now employing more than 5000, moved to San Diego from Buffalo in 1935. It is manufacturing army and navy planes, and is in the process of a huge plant expansion.

Suspect Sabotage At Northrup Plant

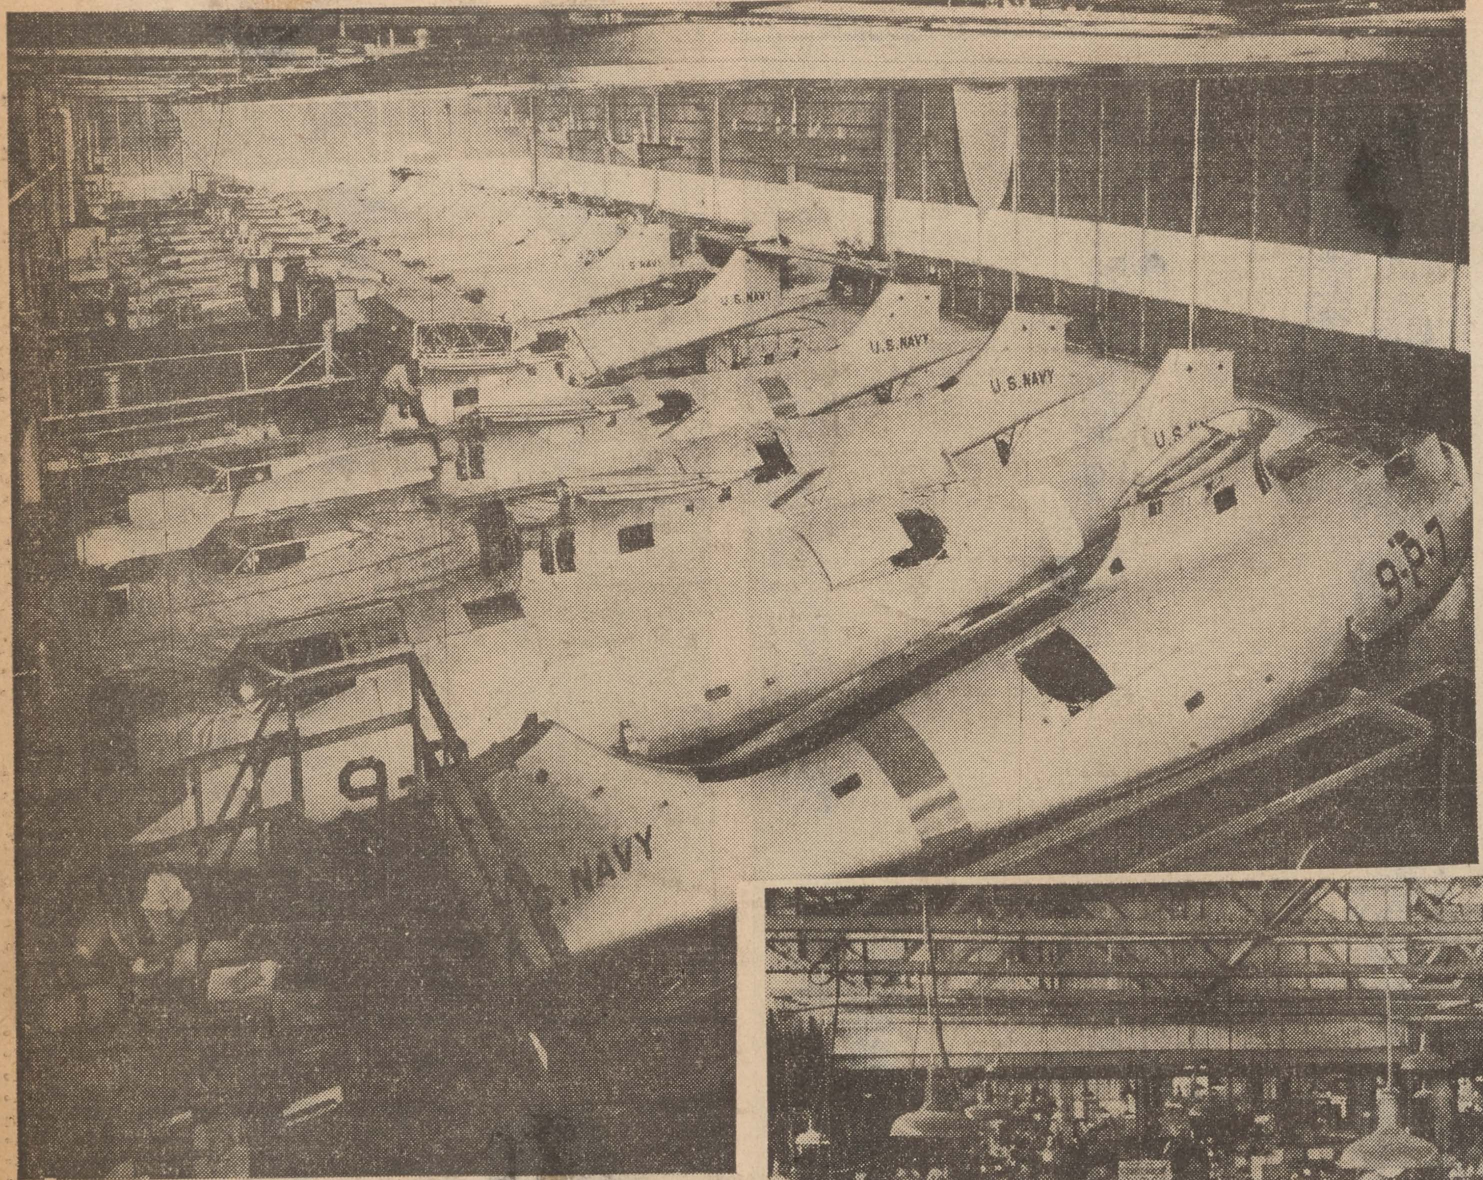
Trib. 5/30

HAWTHORNE, Calif., May 30 (I.N.S.)—In what police called possible sabotage directed at the Northrop Aircraft Corp. factory in Hawthorne, main power lines supplying the plant with electricity were cut early today, according to police. Sgt. E. J. Parker telephoned Deputy Sheriff Lew Davies that some one had wielded a hacksaw on a main pole switch.

The company has a new million-dollar factory and is building parts for the Consolidated Aircraft Corp. at San Diego.

Coast Plants Speed Airplane Production

Union - 6/26/40



With more than 200 of these planes already delivered to the navy, Consolidated Aircraft Corp. is continuing production of its twin-engined Model 28 seaplanes, shown here on the final assembly line.

ENGINES FOR WAR

'Bottleneck' of Aerial Defense Becomes Less Serious as Huge Factories Expand

By DEVON FRANCIS

neighbors in modernizing an army and navy, lacks so many essentials of armament that experts believe she would be hard-pressed to protect her own 1500 miles of coast from foreign assault.

Perhaps, the brightest spot in the defense picture is the long string of great, new commercial airdromes—expected to be ready for service late this summer—stretching north through Rio De Janeiro, Brazil, to link with air fields of the United States.

Developed for use by Pan-American Airline's Buenos Aires to United States service, the fields were built to handle huge four-motor transports. That means they could be used by the heaviest United States bombers as flight bases in any South American emergency.

The new airdromes at Buenos Aires, Rio De Janeiro, Paramarimbo in Netherlands Guiana, Port of Spain on the British island of Trinidad, and San Juan, Puerto Rico, would be convenient stepping stones for the United States bombing planes to danger spots on the eastern coast of South America.

What extent, if any, United States officials have arranged with South American nations for wartime use of the fields has been kept secret.

DEFENSE PLANS SHIELDED

Particularly in the case of Brazil, largest country in South America, and Venezuela, have details of defense plans been shielded behind strict censorship.

Informed sources at Buenos Aires said that so far there had been little or no exchange of defense ideas between the United States and Argentina. Presence of a German military mission at Buenos Aires since 1914 was seen as one barrier for exchange of any such confidential plans.

Both Brazil and Argentina have heavy German and Italian population. One fourth of Argentina's 12,000,000 population is Italian.

Both countries have declared strongly, with the smaller nations of South America, for a common stand to safeguard the western hemisphere.

Argentine spokesmen asked for a stand of non-belligerency instead of mere neutrality, with the comment "we cannot be indifferent" to the events in Europe.

President Getulio Vargas, ruler of Brazil, urged a "common interest of defense" of the Americas.

Especially since the outbreak of war in Europe, South America has speeded its armament.

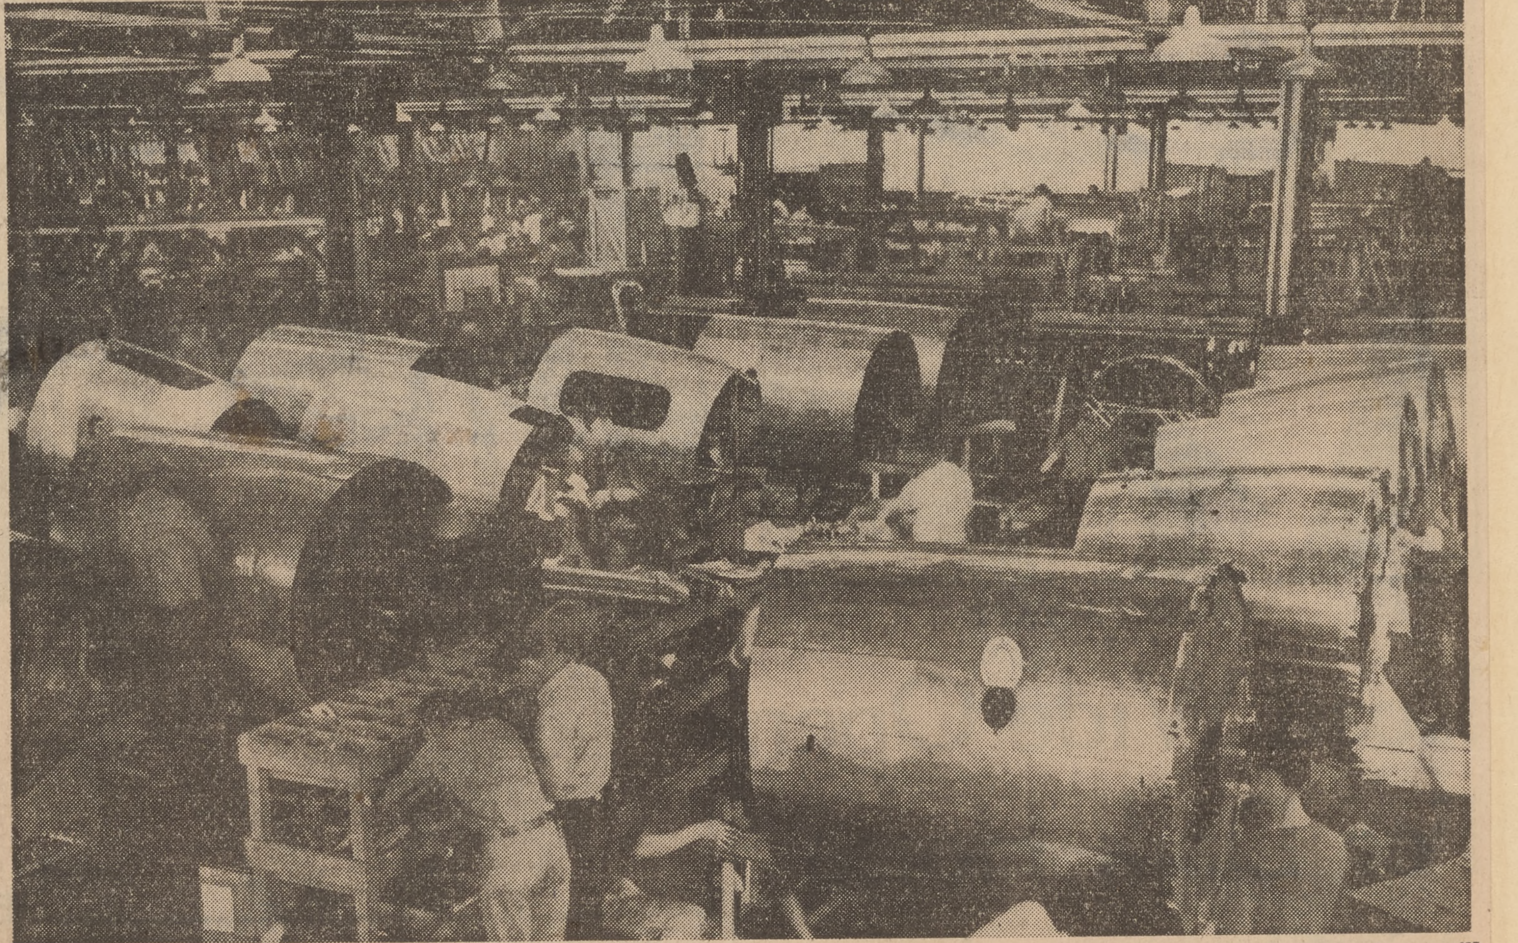
TANKS OBSOLETE

Argentina's well-drilled conscript army has an ample supply of rifles and approximately 1000 pieces of artillery including anti-aircraft, mountain guns and field pieces ranging up to six-inch guns. However, its 40,000 soldiers and 300,000 reservists are without effective motorized equipment. The army's only tanks are 10 old-time, five-ton British tanks hich experts have said are of value only for parades.

The Argentine war ministry is preparing a bill asking 150,000,000 pesos (about $50,000,000) to buy airplanes, more anti-aircraft guns, bombs and other equipment.

Meanwhile, not one peso has been authorized for the purchase of new equipment since 1938.

Workmen are busy in Boeing's Plant No. 1 at Seattle, Wash., turning out miscellaneous plane parts. Employment, already at a record 6700, will be increased when production starts on a new order of planes which probably will go to Britain. (A.P. photo.)



Here are engine mounts being turned out at increased speed in Boeing's Plant No. 1 at Seattle, as part of the U. S. defense program. The newest model of the Boeing bomber for the U. S. army's use will be equipped with four 1100-horsepower motors. (A.P. photo.)

COAST PLANTS READY FOR 1000 PLANES A MONTH

UNION 6-4 40

San Diego and Los Angeles county plane factories could produce 1000 planes a month at present capacity and with expansion might double that output, an unofficial survey indicated yesterday, The Associated Press reported from Los Angeles.

"We are set to go whenever we get the orders," one plane company representative said.

Present production totals 600 planes a month, employing 40,000 workers. The San Diego manufacturers are Consolidated Aircraft Corp. and Ryan Aeronautical Co.

Spokesmen said the southern California companies are ready to increase production and expand whenever needed in connection with President Roosevelt's declaration in favor of war materials aid to the Allies.

Inspector at Consair

Lt. Comdr. Rhea S. Taylor, formerly on duty aboard the aircraft carrier Ranger, has succeeded Comdr. Roland G. Mayer as chief inspector of naval aircraft at Consolidated Aircraft Corp.

Mayer has resigned from the navy to accept the position of production manager and coördinator at Consolidated.

Taylor frequently has been stationed here with aircraft squadrons of the battle and scouting forces.

U. S. Faces Production Problems In Expansion of Aircraft Industry

Output to Exceed Capacity of German Factories

By DEVON FRANCIS
Associated Press Aviation Editor

BALTIMORE, May 25—An American aircraft manufacturer, visiting the German air ministry's imposing edifice in Berln last year, asked an official, "what happed to that big, four-engined plane you had in the blueprint stage a few months ago?"

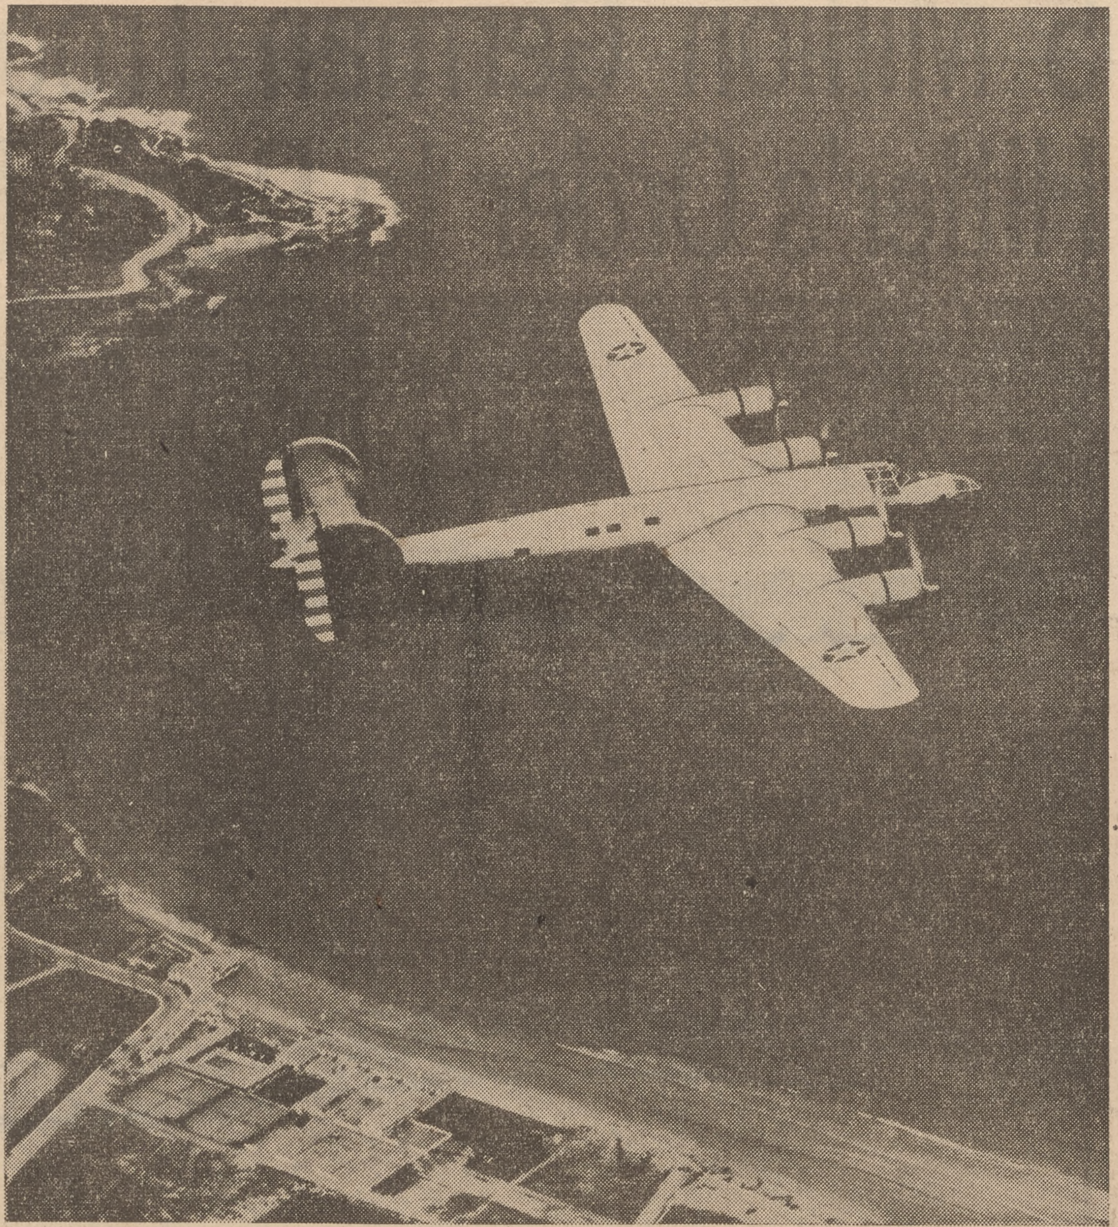
"Oh, that," responded the German. "We built it and discarded it. It wasn't quite what we wanted for production purposes"

In a brief seven months, under totalitarian methods, the Germans had drawn the plans for, built and junked a mammoth war machine. That provides another piece of evidence on the smooth efficiency with which Germany has worked in shaping to the needs of war a highly specialized industry.

SAN DIEGO HOLDS RECORD

The same problems in quick expansion, eingineering and production now face the United States in meeting the demands of the armed services for fresh thousands of warplanes. Turning out 50,000 machines, and boosting American productivity to that figure annually, is a precision job on a mass-production framework.

Up to now the best American plants have done is plan and manufacture a plane in 10 months. That was the time required for a twin-engine flying boat of sensational performance. As a private project of the Consolidated Aircraft Corp., San Diego, it suffered from none of the delays caused by the demands of buyers for changes.



A record for successful plane building was made at the Consolidated plant when this four-motored army bomber took the air less than nine months from the time it was conceived by engineers.

* * *

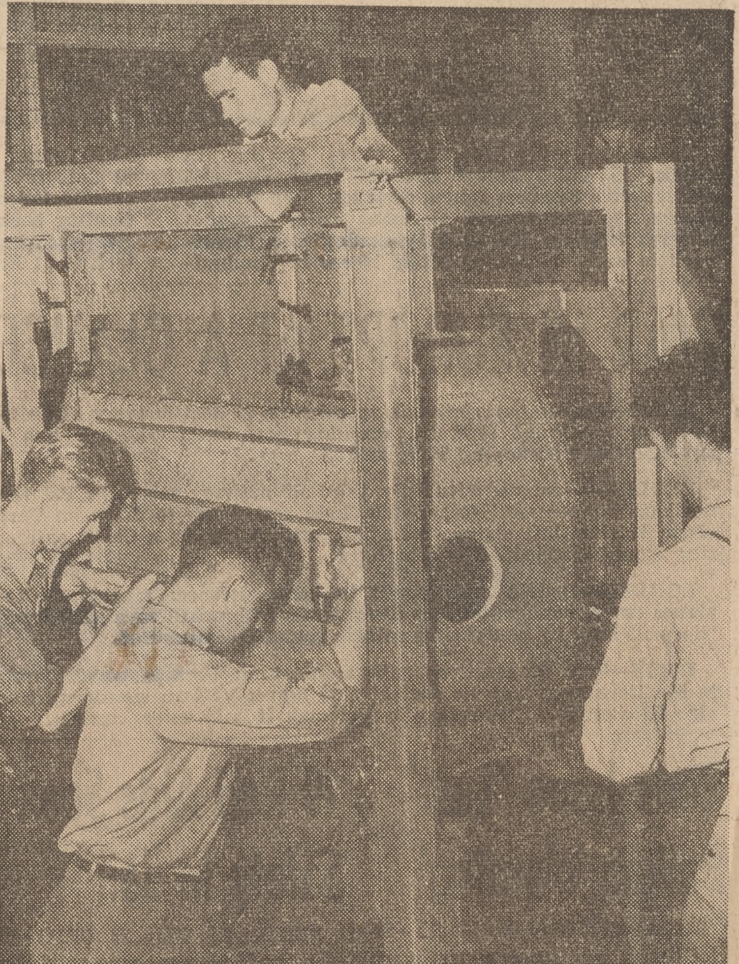
Plane Building Fastest Here

San Diego plane builders are in a position to turn out huge new planes faster than any other plant in the world, despite reports of German superiority along these lines.

This word came from Consolidated Aircraft Corp., world's largest builder of flying boats, but which now has re-entered the landplane field.

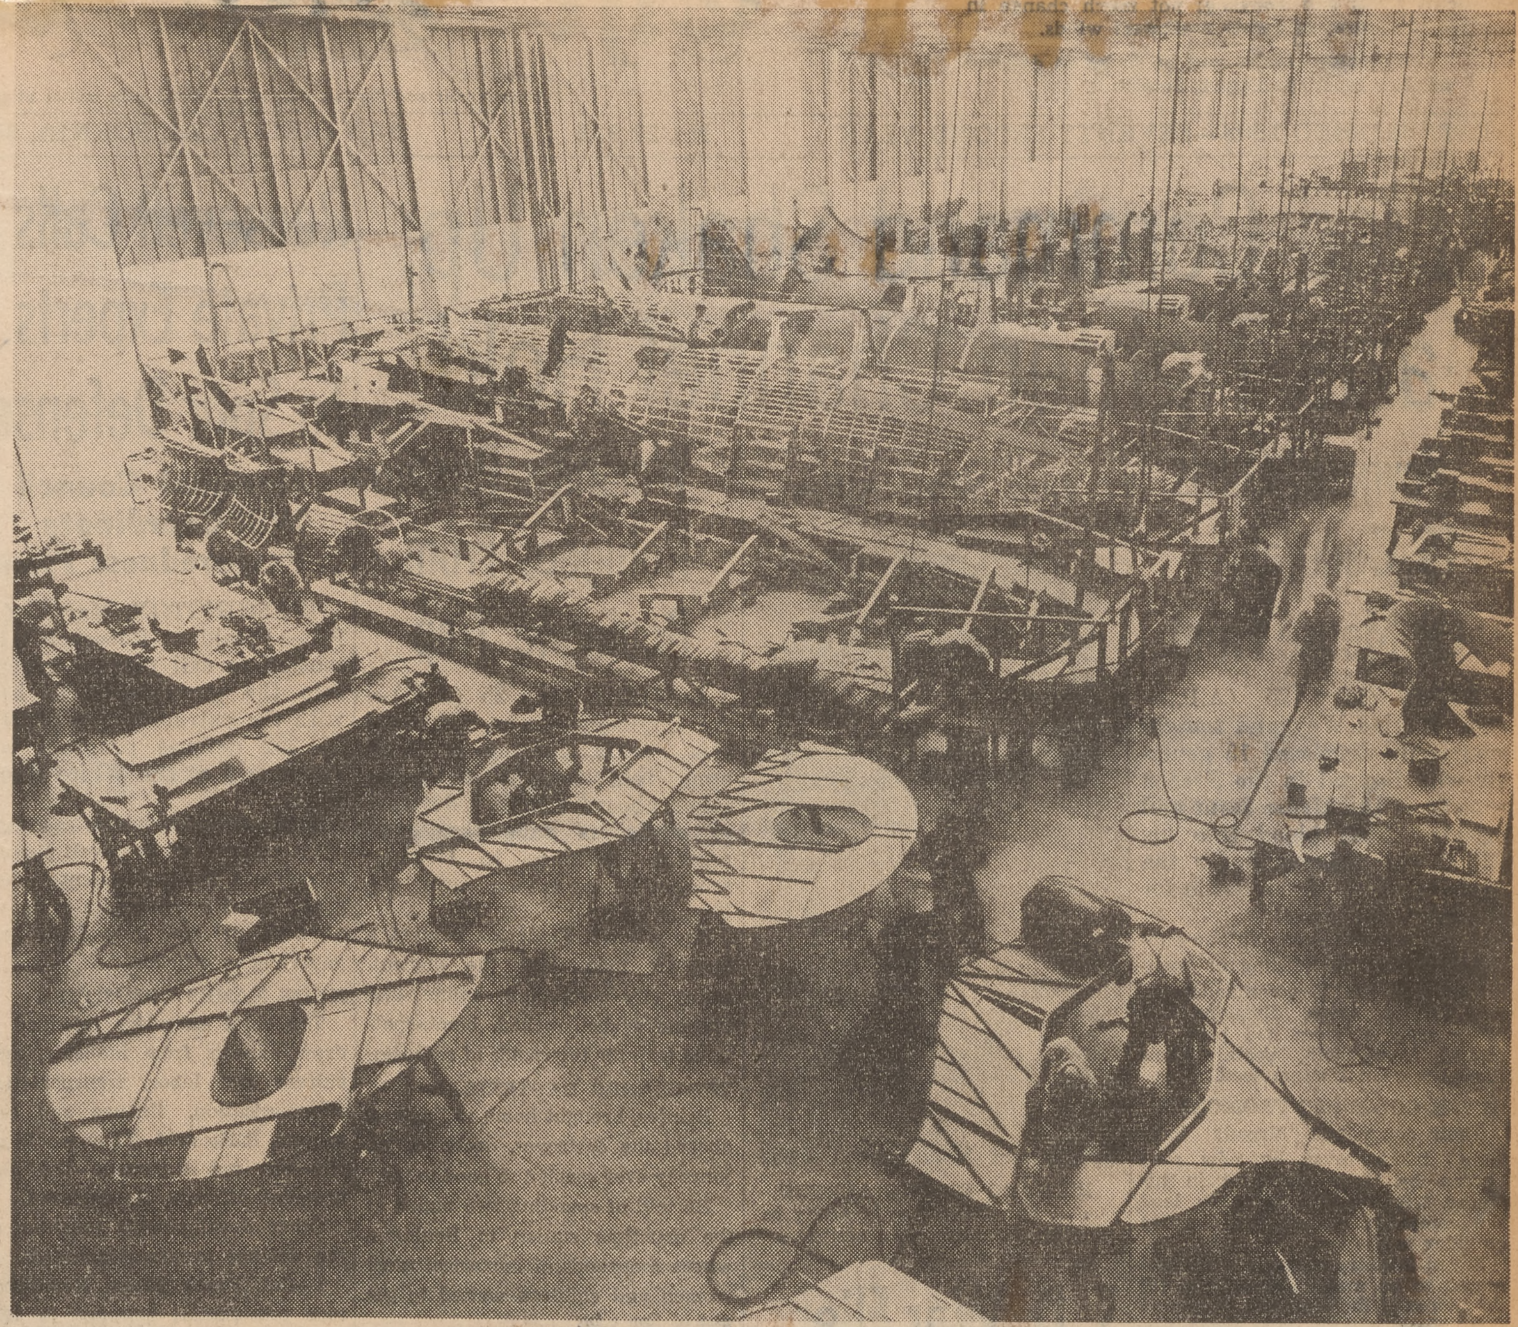
A Consolidated official was told about the German four-motored plane which was designed, built and junked in seven months.

He replied that the great XB-24 —four-motored army bomber—was

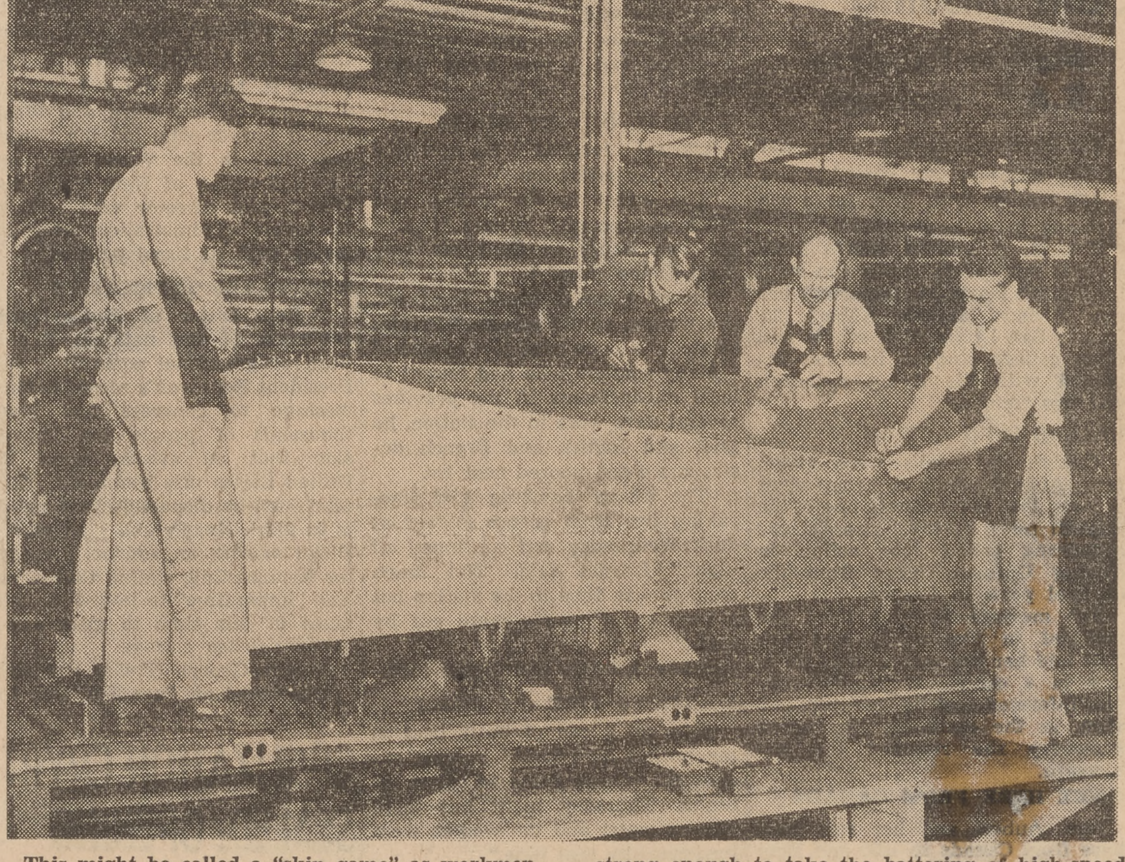


San Diego men rush America's air armament. Here they are working on a tank that forms part of engine nacelle on huge warcraft.

CONSAIR CLAIMS WORLD RECORD FOR SPEED IN WARPLANE CONSTRUCTION



A section of Consolidated's assembly line where the nevy's aerial dreadnaughts are being built. Hulls are seen in various stages of construction. In the foreground bulkheads or formers are being made for another bomber that soon will start down the assembly line.



This might be called a "skin game" as workmen put the metal skin on a wing float that must be strong enough to take the battering of high-speed landings on rough waters of the sea lanes.

New Aircraft Inspector

Capt. S. J. Zeigler, formerly attached to the staff of Vice Adm. Charles A. Blakely, commander battle force aircraft, has reported for duty as inspector general of naval aircraft for the western district with additional duty as naval aircraft inspector at Consolidated Aircraft Corp.

Lt. Comdr. Rhea Taylor, who has been acting navy inspector at Consair, will be assistant to Capt. Ziegler. UNION- 6-15-40

PARIS, May 25 (A.P.) — Police said tonight the Paris mop-up of suspected spies had resulted in arrest of more than 500 persons, including 334 foreigners who were sent to concentration camps.

Sixty thousand were questioned within the last week.

Streets, hotels and cafes were searched.

The detection of spies was complicated by the fact that more than 200,000 Belgian refugees have passed through Paris on their way to shelters.

The papers of refugees were checked to prevent entry of imposters among them.

The newspaper Le Temps advocated farm and factory work for the refugees to replace manpower needed at the front.

Tonight the military commander of Paris announced that all persons, foreign or French whose activity

'Bottleneck' of Aerial Defense Becomes Less Serious as Huge Factories Expand

By **DEVON FRANCIS**

Associated Press Aviation Editor

SEATTLE, June 22.—American aircraft engine production, called a "possible bottleneck" of our rearmament for air defense only last January, is expanding at a rate which will reach 25,000 units of at least 1000 horsepower each by next March.

Additions have been made to plants, and fabricating tools moved in, at a pace which would have been considered impossible last winter when Secretary Morgenthau of the treasury department remarked on the "possible bottleneck."

One of the major plants will have increased its output by 50 percent in December—or nine times the actual number of shipments off its floor in 1938.

The Wright Aeronautical Corp. at Paterson, N. J., has just dedicated a new unit of its great plant, erected and put to work in 57 days. The addition boosts the heavy engine production in this one factory to 1000 units a month.

"I am sure this is not the last of the expansion," said Guy W. Vaughn, president of the Curtiss-Wright Corp., and of Wright Aeronautical, "according to the latest word from Washington."

MADE UNDER PRESSURE

More than half of the heavy aircraft engines being produced in American factories are going to Europe. Some of them are shipped with warplanes. Others are sold separately to power plants manufactured by Britain. All bear the stamp of semi-mass production, achieved under the pressure of a sudden influx of orders from England and from our own armed services.

By March, 1941, this country will be producing annually 25,000 aircraft engines of at least 1000 horsepower each. In terms of air defense that means power for 12,500 bi-motored bombers, for 6250 of the big, four-motored long range bombers which are being delivered to the Army Air Corps by the Boeing factory here in Seattle, or for 25,000 single-seater fighting planes.

In practice, of course, the engines will be divided among the various types of planes which the army and the navy will specify for buttressing the national defense.

The achievement of the Wright Co., and of the Pratt & Whitney Aircraft division of the United Aircraft Corp., in meeting demands for engines—a high precision product—meant the cooperation of some 350 different companies.

TOOL MAKERS BUSY

Chief among them were the tool and die makers. The precision tool makers worked around the clock to have lathes, polishing equipment and grinding machines ready to move into factory additions when the walls were up and the roofs were on.

Ordinarily, nothing is duller to the layman than factory work, but now, of a sudden, the ingeniously fashioned pieces of metal rolling off the assembly lines of the aircraft engine factories have become of major importance. They constitute integral parts of our air defense establishment.

Planes, engines and men to fly and service them are the ingredients of America's expanded air defense.

If engines were a "possible bottleneck" in our air rearmament, as the treasury secretary said, they probably will continue to be a periodic bottleneck for all time to come. An official of an engine factory told me last week that plane manufacture, due to its relative simplicity, always could be boosted faster than engine production.

Aircraft engines, unlike automobile engines, are made to what shop foremen call "tolerances" of microthousands of an inch. It is possible at the Pratt & Whitney factory, at Hartford, Conn., for instance, to smooth a surface to a perfection of 1/40,000th of an inch.

PRECISION TO BE ASKED

Yet the automobile factories may be called upon to turn out such precision work. A Detroit factory is expected to experiment in the production of a Rolls-Royce 1000 horsepower liquid-cooled engine under license soon.

The Allison Engineering Co., of Indianapolis, a subsidiary of the General Motors Corp., is making an aircraft engine in, as yet, small quantities, to power one of the fastest types of American pursuits and an "interceptor" which is scheduled for shipment to the Allies.

Metalurgy, research in lubricating oils and gasolines, engineering and precision machining are responsible for today's high-power warplane motors. The same engine which a few years ago was producing 550 horsepower is today, with refinements, delivering 1300 horsepower.

While automobile motors weigh between six and seven pounds a horsepower, aircraft motors weigh slightly more than a pound, and an engine still on the government's "secret list" actually will produce a horsepower for every pound.

In use now are aircraft engines of 2200 horsepower, and in prospect in the next couple of years are engines of 3500 horsepower.

Aside from the Allison Co., two plants produce almost all the warplane engines made in the United States—those at Paterson and Hartford. And their crying need always has been men trained to do precision work.

EXPERIENCE VALUABLE

At Hartford the other day an applicant for a job was asked, "What can you do?"

"I polish metal," he responded.

"How long have you worked at it?"

"Three years."

"Sorry," was the rejoinder, "that isn't quite enough experience."

A man in his fifties who said he had been a metal polisher for 35 years, was hired instanter.

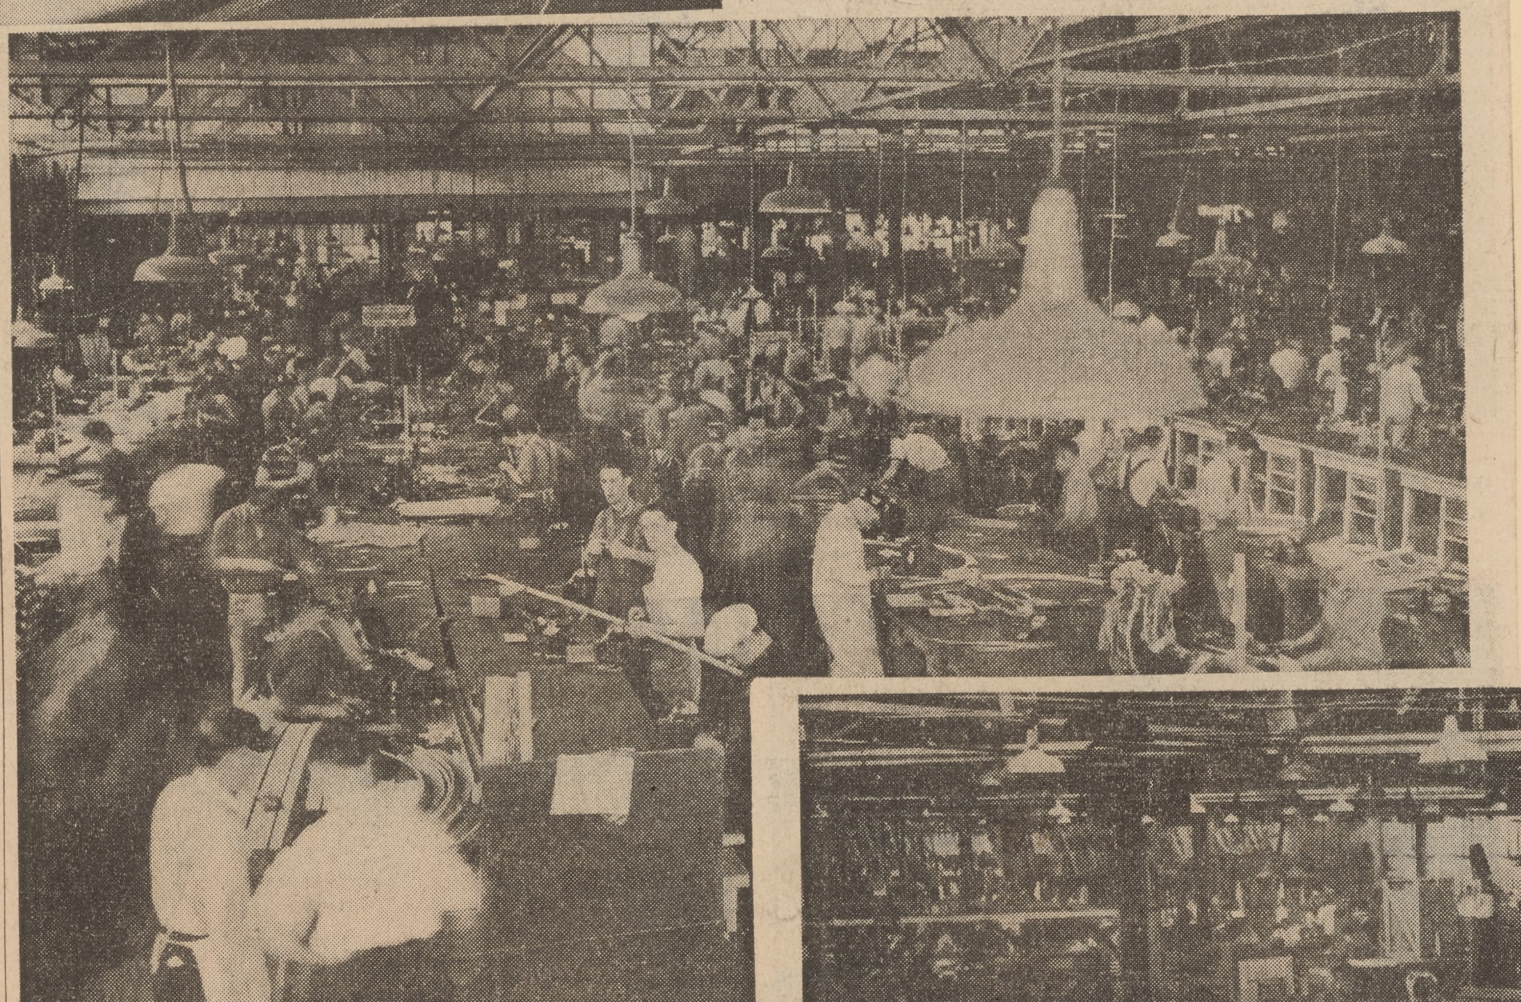
So fine is some of the work that diamond cutting heads are used on precision tools.

Connecting rods must weigh 1-100 of a pound of each other.

Steel cylinder barrels are put in an ammonia bath for 42 hours to harden them further for the punishing treatment they will receive in warplanes.

While American air transport companies run their engines between 400 and 500 hours—between 72,000 and 90,000 miles—before a major overhaul, on the European front repair work is much more frequent. The French have been reported to be using American engines 200 hours before overhaul.

Overhaul requires spare engines for installation in warplanes doing heavy duty work during an offensive, creating additional demands on the engine factories.



Workmen are busy in Boeing's Plant No. 1 at Seattle, Wash., turning out miscellaneous plane parts. Employment, already at a record 6700, will be increased when production starts on a new order of planes which probably will go to Britain. (A.P. photo.)

U. S. Faces Production Problems In Expansion of Aircraft Industry

Output to Exceed Capacity of German Factories

By DEVON FRANCIS
Associated Press Aviation Editor

BALTIMORE, May 25—An American aircraft manufacturer, visiting the German air ministry's imposing edifice in Berln last year, asked an official, "what happed to that big, four-engined plane you had in the blueprint stage a few months ago?"

"Oh, that," responded the German. "We built it and discarded it. It wasn't quite what we wanted for production purposes"

In a brief seven months, under totalitarian methods, the Germans had drawn the plans for, built and junked a mammoth war machine. That provides another piece of evidence on the smooth efficiency with which Germany has worked in shaping to the needs of war a highly specialized industry.

SAN DIEGO HOLDS RECORD

The same problems in quick expansion, eingineering and production now face the United States in meeting the demands of the armed services for fresh thousands of warplanes. Turning out 50,000 machines, and boosting American productivity to that figure annually, is a precision job on a mass-production framework.

Up to now the best American plants have done is plan and manufacture a plane in 10 months. That was the time required for a twin-engine flying boat of sensational performance. As a private project of the Consolidated Aircraft Corp., San Diego, it suffered from none of the delays caused by the demands of buyers for changes.

Ordinarily 20 months elapse here between the time a design is drawn and the first plane of a series, or "prototype," rolls out of the factory for flight testing.

As American factories acquire more floor space and install more machinery to which engineers can look for fast fabrication of parts, that time will be reduced. A fast growing industry only now is finding short cuts in turning out its manifold products.

More floor space, more machinery, more engineers and more skilled and semi-skilled plant workmen—these are the elements which will determine the speed with which America can reach for and attain greater productivity for the national defense.

WORKERS BEING TRAINED

Trained workers are not an immediate problem.

The plants themselves have been tutoring men for new jobs as backlogs have shot into the hundreds of millions of dollars Greater producition, moreover, has so altered manufacturing methods that thousands of skilled jobs are now only semi-skilled.

An expansion of training for men doing semi-skilled work probably will become necessary.

Here in Baltimore, on an estuary of Chesapeake bay, one of the "big four" of American aviation's pioneers, Glenn L. Martin, has demonstrated how sharp increases in plane production can be achieved.

In exactly 11 weeks, in 1939, Martin, the builder of flying boats which for years have been flying the Pacific, doubled the size of his factory. During those 11 weeks he began moving in a million dollars worth of new tools and equipment. Production on the new floor space actually was under way before the brick and mortar work was done.

ASSEMBLY 900 FEET LONG

A good many of the 46 plane plants and 13 aircraft engine plants with their 70,000 employes which make up the American aircraft industry have instituted similar training programs. The big engine factories, particularly the Wright Aeronautical Co., at Paterson, N. J., and the Pratt & Whitney division of the United Aircraft Corp., at Hartford, Conn., have had to inaugurate employe training programs of a special nature because engines require especially fine workship

The Douglas Aircraft Co., at Santa Monica, Calif., and the Lockheed Aircraft Co., at Burbank, have training schools which assure them a steady flow of skilled and semi-skilled workmen.

All the manufacturing processes are rigidly scheduled. A stop-watch is held on the flow of materials, the feeding of parts to the sub-assembly, the movement of the production line and final assembly.

From outside the factory are coming instruments, armament, landing gear, engines and propellers. Scores of other industries enter into the construction of the plane.

Assembly lines—one of them is 900 feet long—resemble those in automobile factories. Planes do not move on power-driven conveyors at set speeds, but they do move, growing from minor assemblies into larger ones, into the skeleton center-sections, tails and noses, into metal "skins" and finally to the installation of engines.

Last year the American aircraft industry produced only 5500 planes of all types, including 3000 so-called "light-planes" for the private pilot. Warplanes totaled less than 2000. To achieve a production of 50,000 planes a year, it is estimated that about 300,000 persons must be on the payroll of the aircraft, aircraft engine and such intimately related industries as those producing aluminum sheets, tubing and instruments

That compares with a little less than 600,000 persons employed in making automobiles, trucks and parts and refining and marketing petroleum products.

The aircraft industry's investment of $750,000,000 probably will be doubled.

A record for successful plane building was made at the Consolidated plant when this four-motored army bomber took the air less than nine months from the time it was conceived by engineers.

* * *

Plane Building Fastest Here

San Diego plane builders are in a position to turn out huge new planes faster than any other plant in the world, despite reports of German superiority along these lines.

This word came from Consolidated Aircraft Corp., world's largest builder of flying boats, but which now has re-entered the landplane field.

A Consolidated official was told about the German four-motored plane which was designed, built and junked in seven months.

He replied that the great XB-24—four-motored army bomber—was designed, built and flown in less than nine months after the government awarded the experimental contract.

"And we didn't have to junk it like the Germans did their seven-month plane," he noted.

Before the less-than-nine-months bomber, the fastest time attained by Consolidated in building a new type was the 10 months it took to engineer and complete its sensational two-engined flying boat. But this was not under the speed-up that comes when preparedness for national defense becomes a factor.

Neither was the army bomber exactly a speed-up proposition Because of this, plant officials believe they beat the nine-month time appreciably in getting big, new models ready for the production line.

The big San Diego plant, now virtually being doubled in size to handle a tremendous flow of orders, has had plenty of experience in building big ships and is able to use this knowledge on the job of getting America's air armada ready.

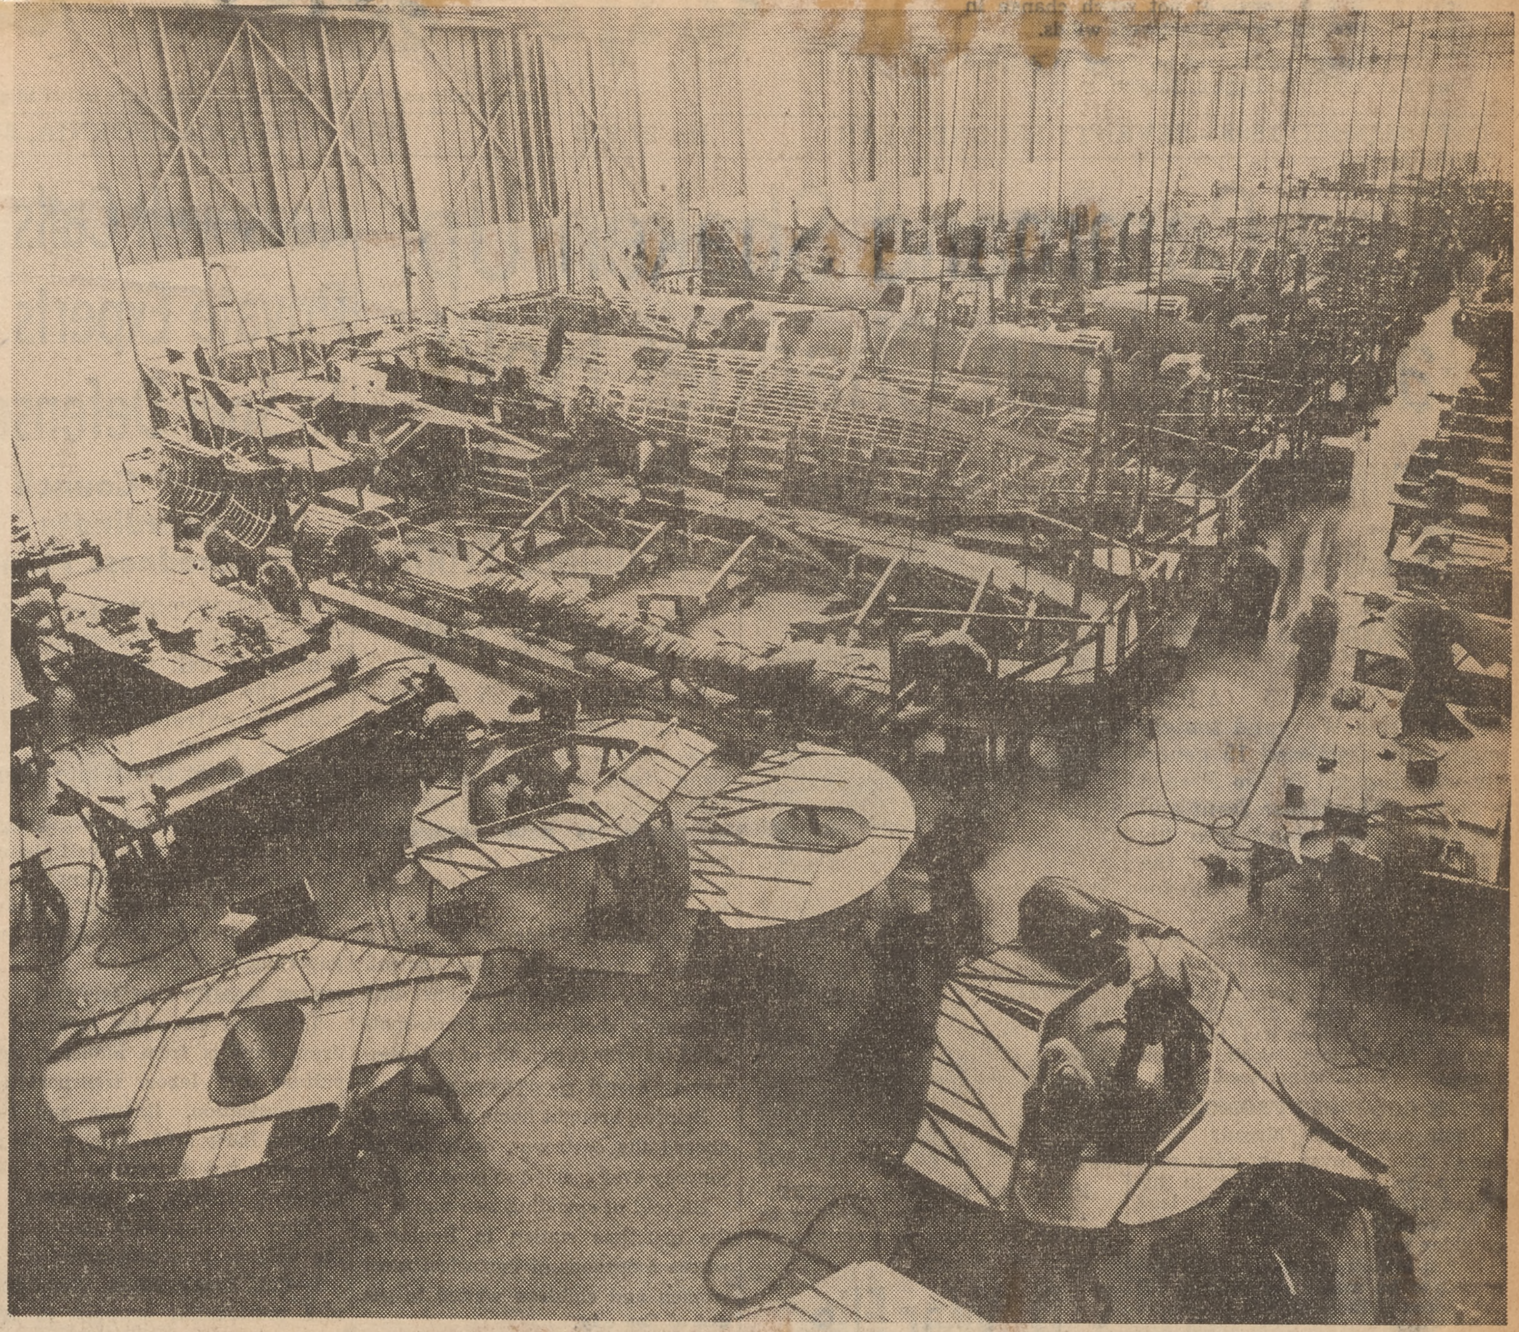
STILL BEING TESTED

The new army bomber, which, according to reports, is the first of a fleet of that type, has been undergoing tests for some time. It was first shown to the public on Army day, April 6. Powered with four 14-cylinder engines rated at 1200 horsepower each, it is said to have a speed in excess of 300 miles an hour, a range of 3000 miles with bomb-carrying capacity of four tons. Its gross weight is around 20 tons, with a wing span of 110 feet and length of 64 feet. The crew will range from to six to nine depending on the mission being flown. It has windows and hatches in the nose, tail, turtledeck, back and bottom.

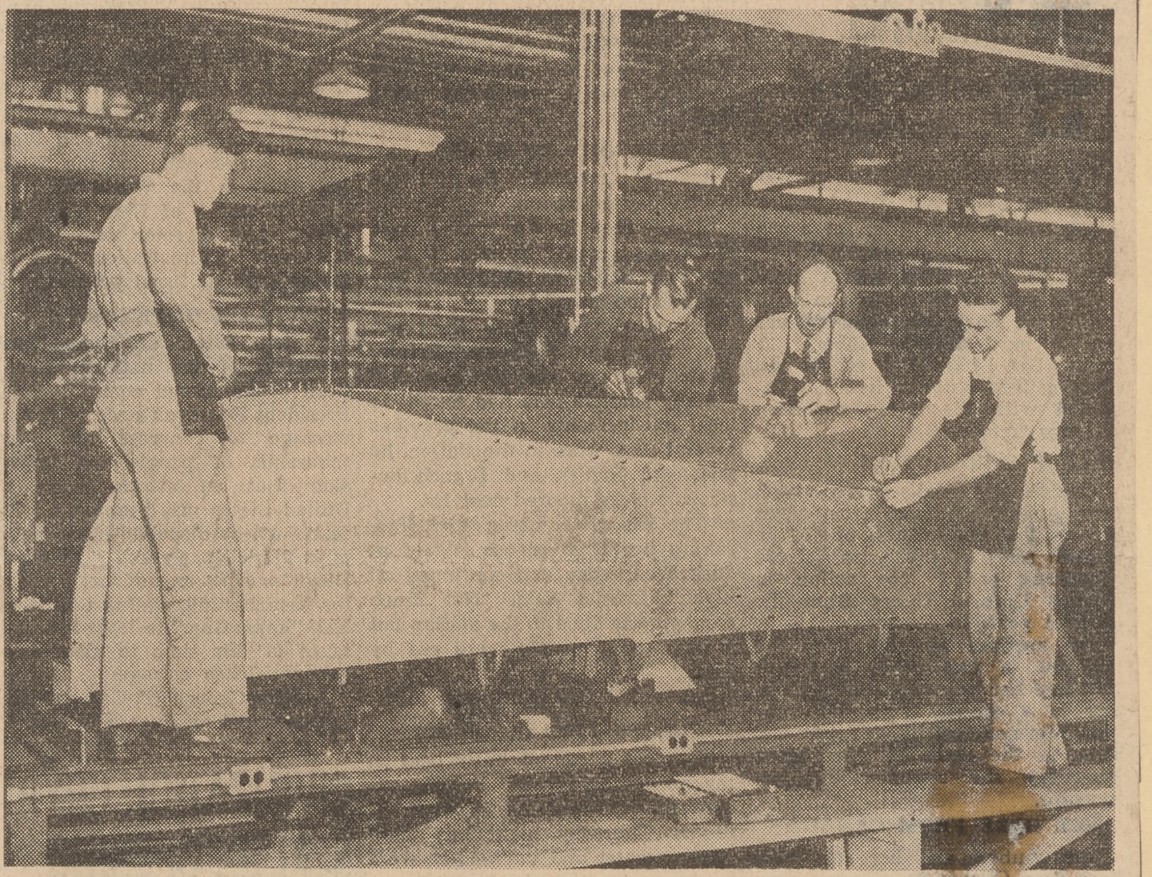
No one says anything about these hatches and windows, but it was said they might be used as ports through which gunners could beat off attacks from all directions.

San Diego men rush America's air armament. Here they are working on a tank that forms part of engine nacelle on huge warcraft.

CONSAIR CLAIMS WORLD RECORD FOR SPEED IN WARPLANE CONSTRUCTION



A section of Consolidated's assembly line where the nevy's aerial dreadnaughts are being built. Hulls are seen in various stages of construction. In the foreground bulkheads or formers are being made for another bomber that soon will start down the assembly line.



This might be called a "skin game" as workmen put the metal skin on a wing float that must be strong enough to take the battering of high-speed landings on rough waters of the sea lanes.

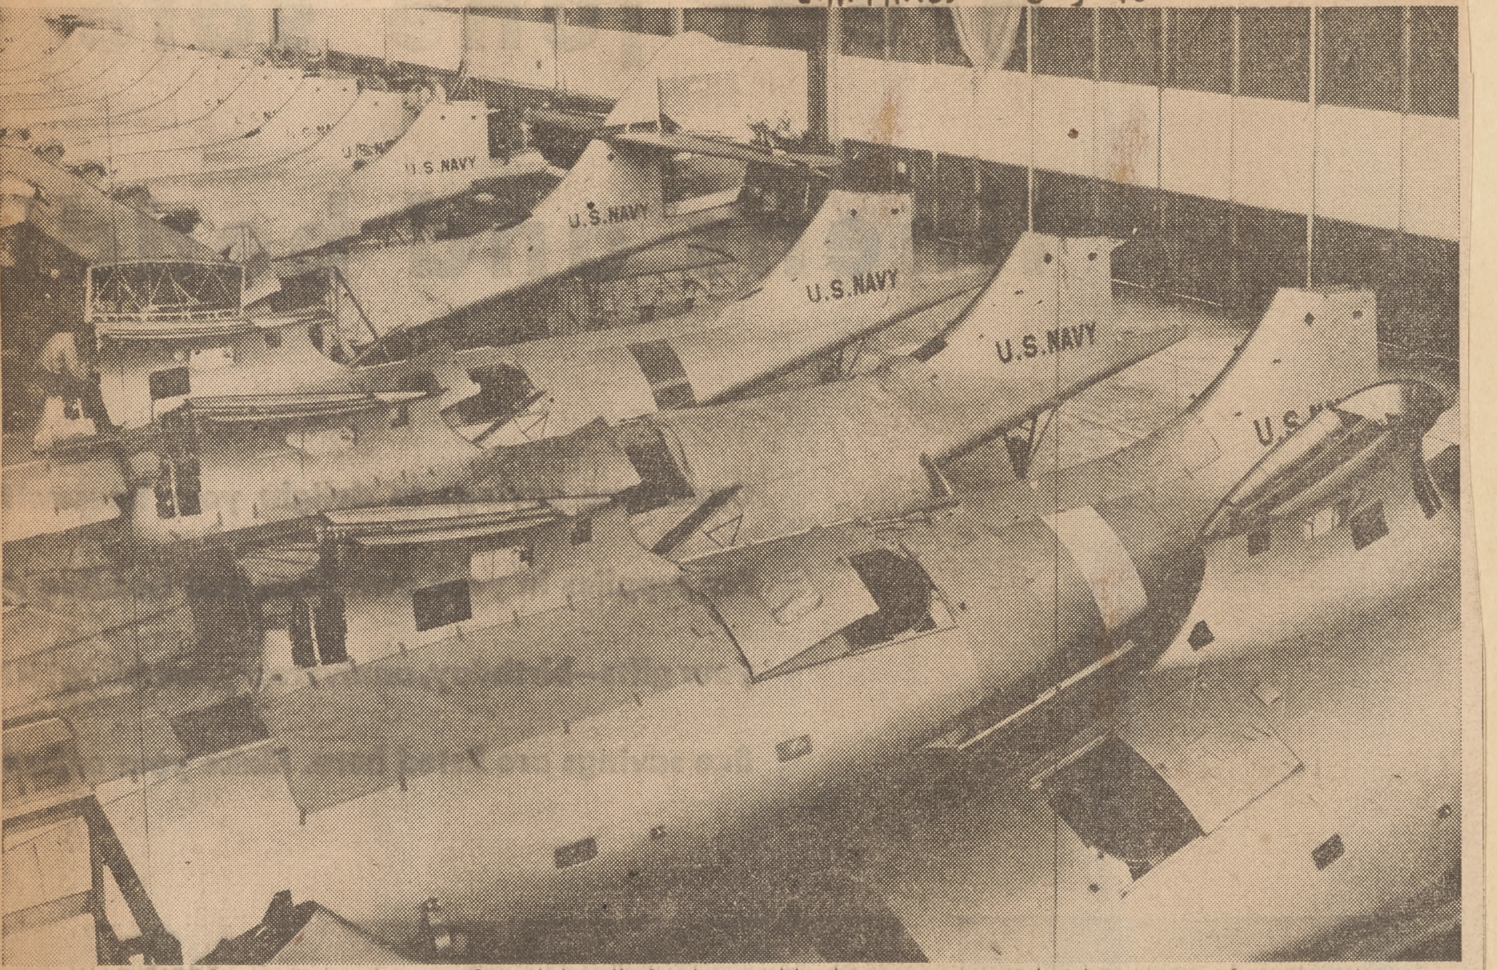
New Aircraft Inspector

Capt. S. J. Zeigler, formerly attached to the staff of Vice Adm. Charles A. Blakely, commander battle force aircraft, has reported for duty as inspector general of naval aircraft for the western district with additional duty as naval aircraft inspector at Consolidated Aircraft Corp.

Lt. Comdr. Rhea Taylor, who has been acting navy inspector at Consair, will be assistant to Capt. Ziegler. UNION- 6-15-40

Huge Aircraft Plant at San Diego Speeds Up Production of Fighting Planes Amid $2,000,000 Expansion Program

L.A. TIMES — 6-3-40



WAR BIRDS—Huge bombers in Consolidated's final assembly shops are pictured in last stages of construction.

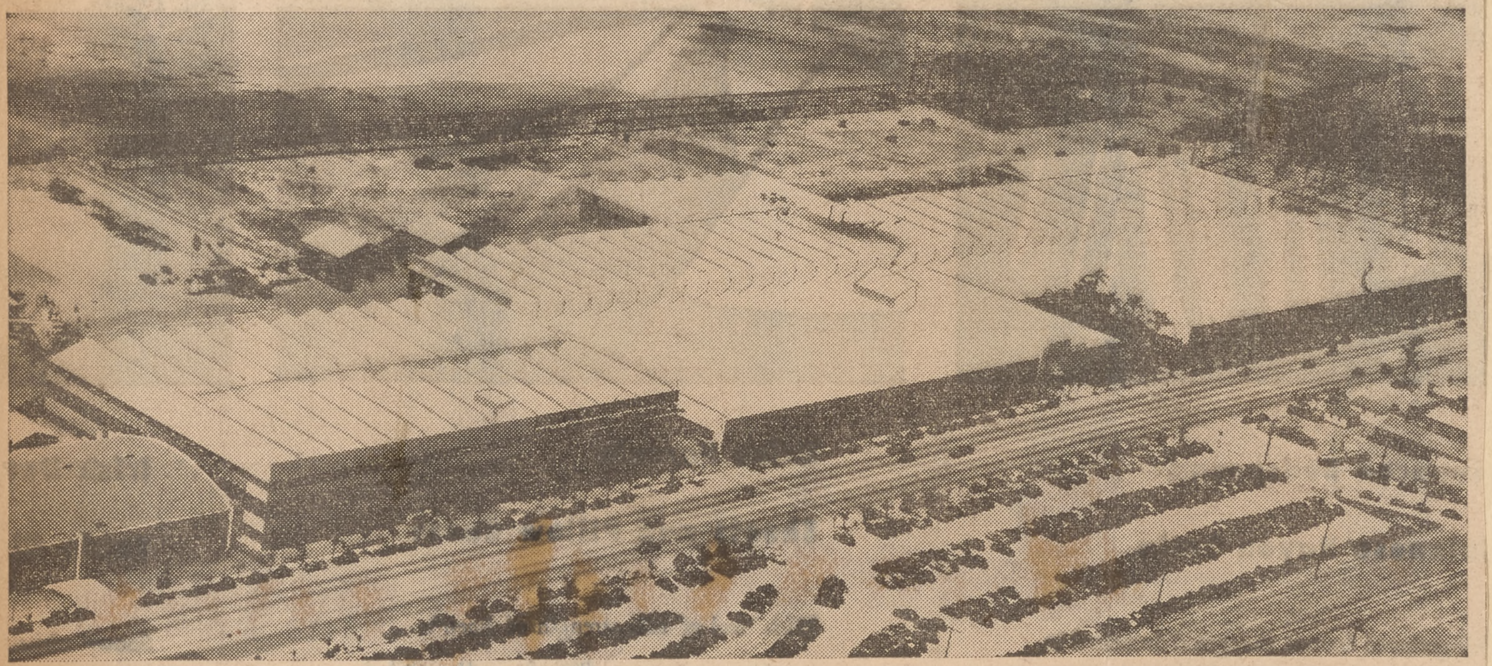
SAN DIEGO, June 2.—Within two months Consolidated Aircraft Corp., San Diego's major industry will boast the largest integrated plane factory in America, company officials disclosed today.

In a single enclosed area by Aug. 1 will be 1,910,000 square feet of airport land under operation for further expansion, Maj. Reuben H. Fleet announced as top speed was ordered in completion of a 90 per cent addition to the plant, at a cost of $2,000,000.

Then the great factory, a key unit in national defense plans, will be able to operate full blast in producing hundreds of Army and Navy bombers—not only for this country but for the Allies. Unfilled orders total $70,000,000 and the concern's vaulting pay roll has just passed the 6000 mark, with the 10,000 figure due to be reached by the end of this year.

Consolidated, established 17 years ago in the East, moved to San Diego from Buffalo, N.Y., in 1935 and since has become the world's largest manufacturer of flying boats.

Its latest product, a 20-ton four-engined Army bomber capable of flying more than 300 miles an hour, has a range of 3000 miles and a bomb-carrying capacity of four tons. Approximately 100 of these, known as the "Liberator" type, have been ordered by Allies.



GROWING—Consolidated's improved workshops shown in air photo, with new buildings being added at right.

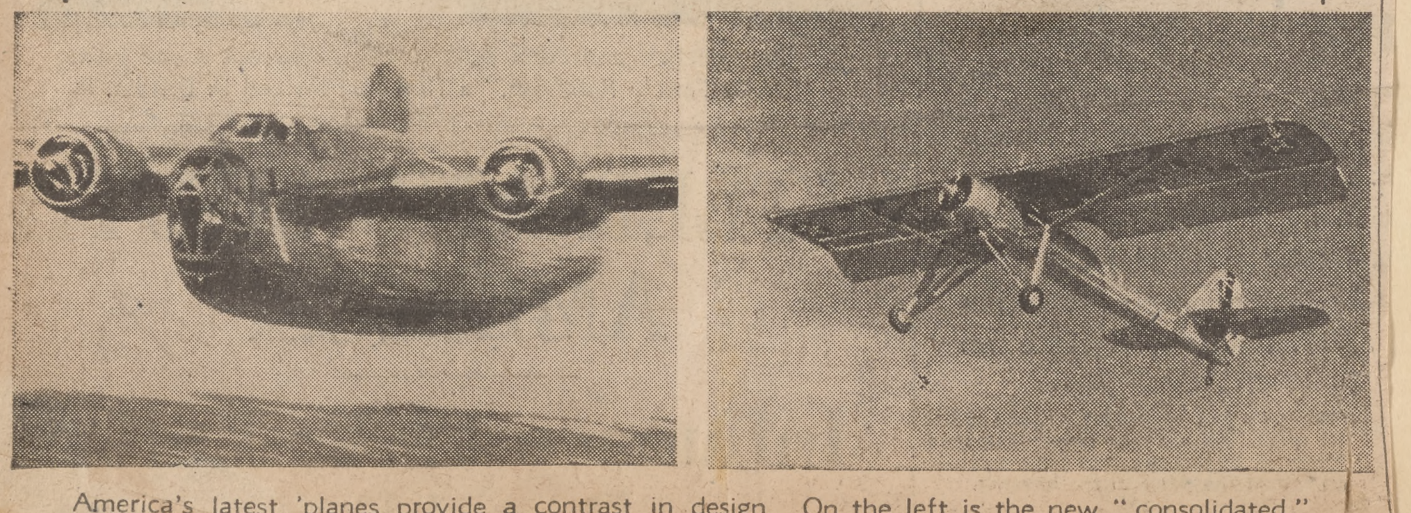
America's Latest 'Planes



America's latest 'planes provide a contrast in design. On the left is the new "consolidated" bomber, capable of carrying four tons of bombs and of a huge range, and on the right is the "Dragon-Fly" 'plane, which can hang motionless in the air and then dart off at great speed.

Taylor Chosen As Successor Of Mayer

6/11/40 UNION

Comdr. Roland G. Mayer, who officially retires from the navy July 1 to become production manager and coordinator for Consolidated Aircraft Corp., succeeding the late Comdr. Donald M. Carpenter, is being relieved as chief inspector of naval aircraft for San Diego by Lt. Comdr. Rhea S. Taylor, who comes here from duty aboard the airplane carrier Ranger, now in east coast waters, according to report at the Consolidated plant.

Mayer, who joined the navy in 1918, holds licenses as both a pilot of heavier-than-air and lighter-than air craft, with a high record for hours of flight in lighter-than-air craft. He saw duty in the dirigibles Shenandoah, Akron, Macon and Los Angeles, and survived the crash of the Shenandoah.

Taylor was born in Oakland in 1891. He enlisted during the war and attended the ground school aviation course at M.I.T., following this with preliminary flight training at Key West and Miami and advanced training at Pensacola. He received his commission in the naval reserve Oct. 23, 1918, and during the next year instructed in the handling of big airboats.

Taylor saw service with the first shipboard plane operations on battleships before the use of catapults, and had charge of overhaul and reconditioning of planes which were used in taking off from the battleships on a specially-constructed 60-foot runway built atop the battleship turrets.

After serving with the first battleship squadron on the west coast, Taylor from 1922 to 1935 served successively with observation, fighter, patrol boats, cruiser scouting planes and carrier scouting planes at San Diego and Pearl Harbor. Then for three years he was inspector of naval aircraft at Pratt-Whitney and Hamilton Standard Propeller division of United Aircraft at East Hartford, from where he went to duty aboard the Ranger.

CONSAIR PERSONNEL REACHES ALL-TIME RECORD OF 7560

Consolidated Aircraft Corp. attained an all-time employment high yesterday when the total number of men and women employed was 7560. Donald Frye, personnel director, said employes are being added at the rate of 75 a day.

The peak of 10,000 is expected to be attained Aug. 1 when the company's $2,000,000 expansion program of the company's present backlog and number of employes with operations at Buffalo. The total floor space at Buffalo was less than 200,000 square feet, while the plant today occupies 1,910,000 square feet of covered and uncovered manufacturing space with an additional 954,440 square feet of municipal airport property under option.

The backlog including new contracts expected to be received this month will amount to $120,000,000. Heretofore the largest number of employes was 4300.

In the last 17 years Consair planes have been sold to Brazil, Siam, Peru, Argentina, Mexico, Cuba, Canada, Colombia, China, Portugal, Turkey, Rumania, England and France. The bulk of the present contracts are for long-range bombers for the U. S. army and navy and for the British Royal air force.

CONSAIR PERSONNEL REACHES ALL-TIME RECORD OF 7560

Consolidated Aircraft Corp. attained an all-time employment high yesterday when the total number of men and women employed was 7560. Donald Frye, personnel director, said employes are being added at the rate of 75 a day.

The peak of 10,000 is expected to be attained Aug. 1 when the company's $2,000,000 expansion program is completed.

In accordance with the government's plans to accelerate aircraft production, Maj. Reuben H. Fleet, Consair president, has just put into effect a six-day 48-hour weekly schedule in all manufacturing departments. The new schedule will step-up production 20 percent and will increase the payroll by 30 percent due to payment of time and a half over the normal 40-hour week schedule, Fleet said.

New structures which are to be commissioned Aug. 1 include the 700-foot long final assembly building, experimental building annex, final finish building, additions to the paint shop, boiler house and hull and wing department.

Consolidated started operations 17 years ago at East Greenwich, R. I. In 1924 the plant was moved to Buffalo, N. Y., where it remained until 1933 when it came to San Diego.

The tremendous growth of Consair is exemplified by a comparison of the company's present backlog and number of employes with operations at Buffalo. The total floor space at Buffalo was less than 200,000 square feet, while the plant today occupies 1,910,000 square feet of covered and uncovered manufacturing space with an additional 954,440 square feet of municipal airport property under option.

The backlog including new contracts expected to be received this month will amount to $120,000,000. Heretofore the largest number of employes was 4300.

AIRCRAFT BOUGHT FROM U.S.

"HUGE QUANTITIES"

FROM OUR OWN CORRESPONDENT

NEW YORK, April 18

Mr. Arthur B. Purvis, head of the Anglo-French Purchasing Mission, announced in Washington to-day that the Allies have already purchased "huge quantities" of the three latest types of American military aircraft, and that additional contracts would be signed "in the very near future" for others of five types which the United States Government released for sale only last week. He said that the sums involved were "very large indeed."

Contracts were signed in New York yesterday for great numbers—he did not specify how many—of Curtiss fighters and Douglas attack bombers. The latter are reputed here to be the fastest machines of their type in the world. A third contract will be signed immediately for another of the types just released. The five types released last week were the Curtiss P-40, the Douglas attack bomber, the Bell P-39 fighter, the Lockheed twin-engined P 38, and the Lockheed-Hudson twin-engined light bomber.

5,000 IN 18 MONTHS

Mr. Purvis said that besides the Curtiss and Douglas aeroplanes which it had already purchased, his mission had obtained authorization to buy recent models of Glen Martin bombers and Lockheed fighters.

It has been known for some time that the representatives of the Allies have been negotiating for as many as 1,500 Curtiss P-40 and P-40-D fighters, and about 700 Douglas light bombers, and it has been understood that negotiations are well advanced for the purchase of about 1,200 Lockheed interceptors and Lockheed Hudson light bombers, 750 Martin bombers, and several hundred Bell P-39 fighters. Altogether the Allies are expected to contract for about 5,000 aircraft in this country, all of them to be delivered within 18 months.

Mr. Purvis said that the invasion of Norway had not affected the plans of the Purchasing Commission, and that the Allies had expected some kind of active campaign this spring.

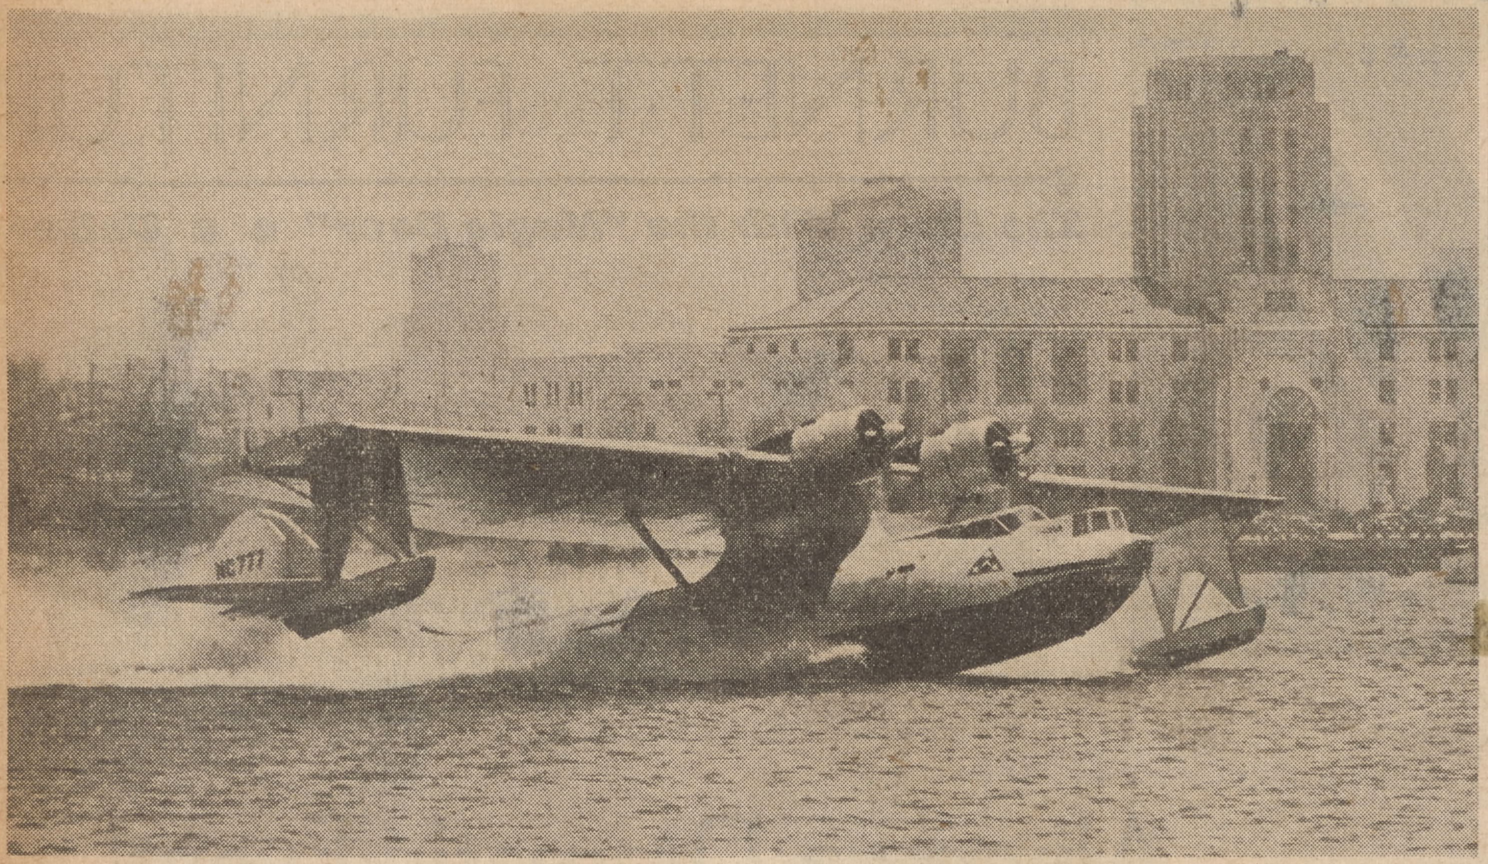
"FLYING FORTRESSES"

It was reported in New York last night that the Allies were negotiating for the purchase of 50 or more four-engined bombers from the Boeing and Consolidated Aircraft Companies. A "flying fortress" of an advanced model has already been released for export, and the Consolidated Company's B-24 has been "released for negotiation"—that is, it will be released for actual sale soon as the company will agree to furnish the U.S. Air Corps with a still later model. Both types have records of extraordinary performances.

A "flying fortress" last year flew non-stop from California to Virginia, 2,317 miles, in 10 hours 45 minutes, and six of them made a mass flight from Miami to Buenos Aires—a distance of 5,260 miles—in less than one and a half days, making only two hops with a stop at Lima. In the Consolidated's patrol bombers Navy airmen have established outstanding records for mass flights. The most notable of these flights were from San Diego to Pearl Harbour in Hawaii (2,553 miles) and from San Diego to Coco Solo in the Canal Zone (3,087 miles).

THE SAN DIEGO UNION: SUNDAY MORNING, JULY 7, 1940

FAMED FLYING BOAT TAKES OFF ON TEST WITH 12 PASSENGERS, CREW OF 5



With spray cascading over wings and fuselage, the world-famed flying boat Guba takes off from San Diego bay abeam the Civic Center on a test flight to Lake Huntington, in the Sierras. Archbold's craft is carrying 12 passengers and a crew of five.

. . . attendant removes chock from Guba's wheels.

Guba Reaches Lake Huntington In 3-Hour Hop

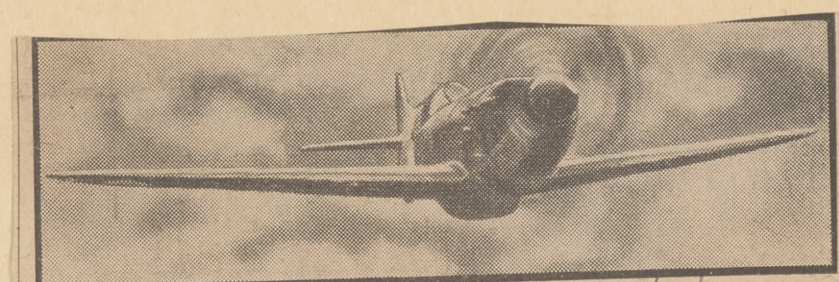
On a test flgiht before leaving here Tuesday for Port Washington, Long Island, Richard H. Archbold's famed San Diego-built flying boat Guba took off from the harbor at 11:26 a.m. yesterday and at 2:30 p.m. landed on Huntington lake in the Sierra Nevada mountains.

The Guba carried 12 passengers and a crew of five. At the controls were Russell Rogers and Douglas Kelley, who will pilot the big plane on its flight across the continent.

Rogers, the United Press reported, had difficulty landing the Guba on the mountain-ringed lake. Owing to the lake's great depth he was unable to use the plane's anchor. The Guba was moored to a small island and the passengers were taken ashore in motorboats. Huntington lake is 50 miles northwest of Fresno.

Barney Boyd, local radio amateur, who has maintained radio communication with the Guba on all its record breaking flights to and from Africa, Netherlands New Guinea and Australia, said he maintained a two-way conversation with Rogers on yesterday's flight. Boyd also will keep in constant contact on the Guba's flight to Port Washington. The Guba is expected to return here tomorrow afternoon.

Archbold, San Diego and New York scientist, is in the east.



London *Daily Express Air Reporter* 4/13/40

THIS single-seater fighter is the Spitfire of the French aircraft industry.

Large numbers of this type have been sent to the Western Front in the past few weeks.

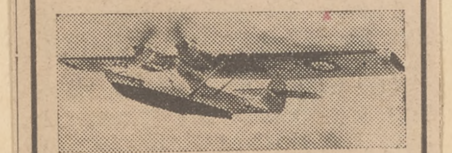
They are faster and probably more heavily armed than any other fighters, American or French, in France's air force.

Their distinctive features appear to be the slim fuselage and small wings.

They are the smallest fighters now on active service in any air force.

Monday's Quiz will tell what can be told about them up to now.

Yesterday's 4,000-mile range American flying - boat was a



CONSOLIDATED PBY

—with two 1,000 horse-power engines. The PBY is all metal, with a top speed of 206 miles an hour.

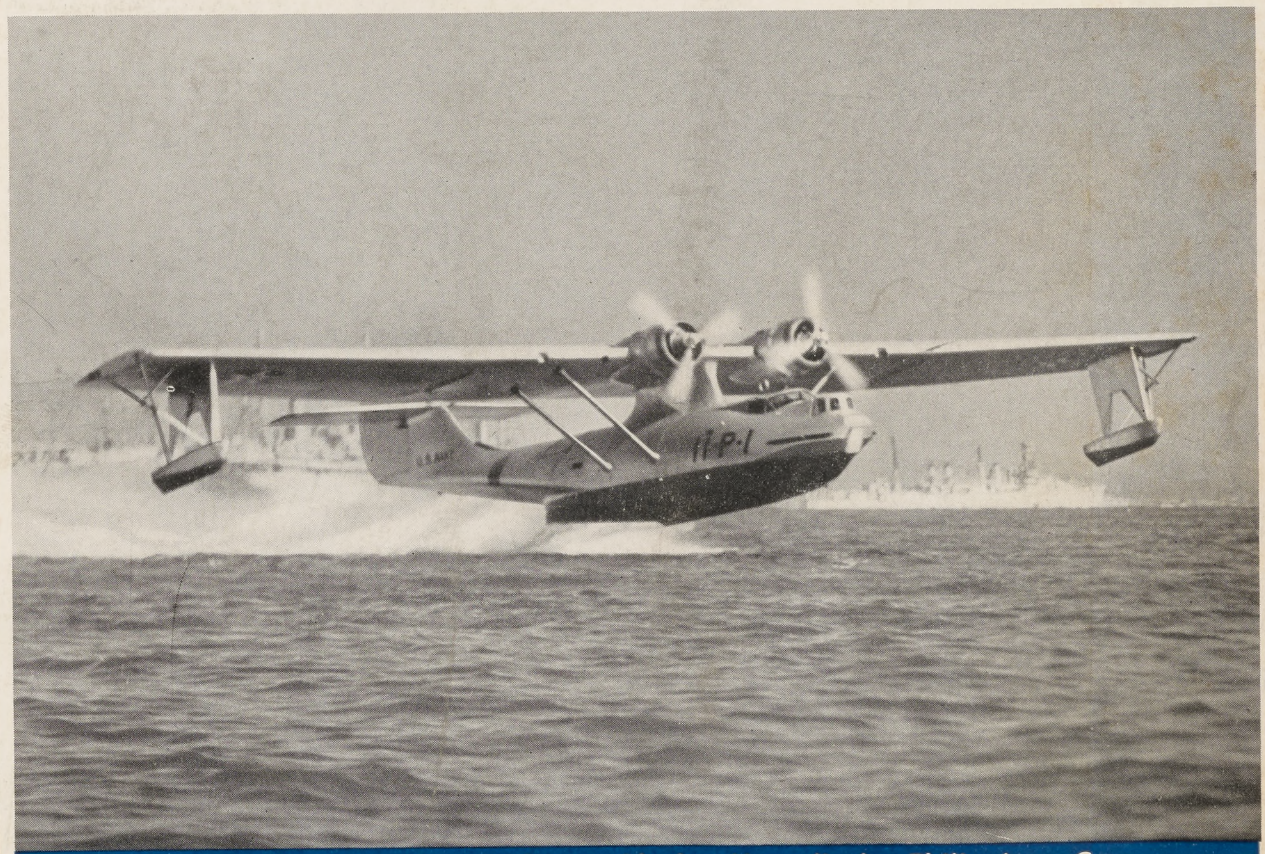
Its armament and war equipment for use with the R.A.F. are secret. But since war began these types of flying boats have operated anywhere between Iceland and the North Atlantic, either on northern blockade reconnaissance or convoy and on submarine patrol.

In the U.S. naval air arm similar types have flown around the world in record-making service formation flights.

WESTERN FLYING

FEB 5

February 1940 **25 Cents**



Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

PRATT & WHITNEY AIRCRAFT
EAST HARTFORD, CONNECTICUT
ONE OF THE THREE DIVISIONS OF UNITED AIRCRAFT CORPORATION

THE TRIBUNE-SUN, San Diego, Calif., Tuesday, June 4, 1940

Consair Plant To Be Largest in U. S. When Completed; Cite 17-Year Record

The following report on the progress being made towards Consolidated Aircraft Corp. becoming the largest aircraft plant in the United States was issued by Consair officals:

Consolidated Aircraft Corp., present expansion program, now being rushed to completion with full manufacturing facilities estimated as completed by Aug. 1 brings this plant into full alignment with the president's recently announced emergency defense program for building a vastly expanded number of aircraft. When completed, Consolidated Aircraft Corp. will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,440 square feet of contiguous airport land under option for futher expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

U. S. Planes in Backlog

Consolidated Aircraft Corp. is unique in its possession of most favorable conditions surrounding its ascendency as the largest aircraft plant in America.

The greater preponderance of its backlog now noted at over $70,000,000 consists of United States government work, with a small proportion of its contracts for foreign deliveries, leaving the company relatively free from any contingencies which might arise over the turn of events abroad.

In undertaking its present plant expansion to enable it to meet this volume of business, a closing agreement was entered into between Consolidated Aircraft Corp. and the United States treasury department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

Through the naturally equitable climate of San Diego, site of the huge plant, fully 30 percent of the manufacturing operations in building the planes may be conducted out of doors. Provision has been made for this by paving the entire plant yard area and providing suitable outlets for power-lines, etc., thus giving exceptional flexability in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. Taking as an arbitary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent of spares furnished, Consolidated has constructed more than three times as many such planes as all other manufacturers combined. This includes those built in the World war period. Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other United States manufacturers combined.

Successful Flights

As early as 1934, six Consolidated P2Y-1 twin engined flying boats in the service of the U. S. navy, flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop. Phenomenal success followed the current Model 28's, or United States navy PBY's the larger twin- flying boats. With these planes scarcely off the line the United States navy began a series of 'routine' delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Another 88 in groups of from 12 to 18 at a time, have been flown non-stop from San Diego to Coco Solo in the Canal zone, a distance of 3087 miles. Aboard these planes were some 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29, a huge four-engined craft built for the United States navy, and the Model 31, a twin-engined flying boat boasting the first two radial aircooled engines of 2,000 horsepower each, ever to be installed in a plane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the United States army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States army air corps recently stated, "This plane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles an hour, a range of approximately 3000 miles and a bomb-carrying capacity of approximately 4 tons."

World's 'Best' Planes U. S. Models In Drive to Goal of 50,000 in Year

Tribune - 6-15-40

(Editor's Note—How do our warplanes compare in types and performance with those of Europe? Here is the answer in a story by the aviation editor of the Special News Service of The Associated Press, who is on a tour of the leading American aviation manufacturing plants.)

By DEVON FRANCIS
Associated Press Aviation Editor

LOS ANGELES, July 15—The United States has some of the world's best warplanes to model on in setting up its factory production facilities for a drive to the goal suggested by President Roosevelt—50,000 machines a year.

Our problem in air rearmament is not so much plane performance is it is large production of both planes and pilots, with the scores of thousands of mechanics to service the planes once they are produced.

We have the necessary planes in types. The idea has been advanced in recent weeks that we have, in fact, too many good types—that we need a simplification of types to assure high factory productivity. A factory can reach its maximum production only if it concentrates on the manufacture of one or two standard models.

Germany introduced a new note into aerial warfare when it sent planes by the hundreds into battle on the assumption that a certain percentage of them was "expendable," like infantrymen. Some of those German planes are not of superlative performance. The German "Stukas," used for dive bombing, for instance, have a top speed of only 220 miles an hour. The famous German single-engine fighter, the Messerschmitt "109," has a level-flight top speed of about 310 miles an hour, considerably short of the performance of two of our fighters, the Curtiss P-40 (top speed 365 miles an hour) and the Bell P-39 (375 miles an hour).

Exceeded in Performance

Two of our newest dive bombers, the Vought-Sikorsky XF4U-1 shipboard fighter and the Curtiss SBC-4, exceed the Stuka in performance, but whereas Germany has Stukas in quantities great enough to throw them into battle in expectation of considerable losses we have only a few score in old and new types.

The Vought-Sikorsky prototype still is being tested for the navy, and the Curtiss type is only getting into production.

Incidentally, the United States navy originated the technique of dive-bombing. Germany adapted the idea to its own use.

In spite of limited research facilities in the United States, American warplanes of "service" caliber frequently have led the rest of the world in performance. Russia excepted, we probably have the world's largest and most efficient long-range, heavy bombing planes, exemplified in the Boeing four-motor and the new Consolidated B-24 four-motor bombing types. The first is made in Seattle, the second in San Diego.

Our Lockheed P-38 bi-motored interceptor, a new type in our army, is designed solely to fight bombing planes. It has a high rate of climb and a high speed of 405 miles an hour.

Our "light bombardment" planes, designed for attacking troops, have a high speed of 395 miles an hour with a bomb load of 2400 pounds. Unlike the Stukas, however, these planes, known as the Curtiss A20's, do not dive on their objectives.

Our medium-weight bombers, such as the Douglases and Martins, are at least the equal of any similar aircraft abroad. The development of bombardment types is part and parcel of a high command's tactical plans.

Two New Types Considered

Our heavy bombardment planes are designed for use against the warships, aircraft carriers and troop transports of any invader.

There is talk now in the American aircraft industry of two new types of aircraft for the Army Air corps—an inexpensive, short-range "baby" fighting plane, made in great quantities for "local" defense, and large numbers of dive bombers for the same tactical use to which Germany is putting its Stukas.

Reduction in cost also is receiving serious study. If one of our four-motored bombers were shot down attacking an enemy fleet, it would mean a loss of $400,000, counting both plane and armament. Each of our pursuits costs from $60,000 to $70,000.

The navy has two general types of planes, each operating intimately with surface units. The navy's shipborne and land-based aircraft are slower than similar air corps planes and enjoy less freedom of action.

Because the navy must make the maximum use of its limited facilities on the aircraft carriers, it often combines several functions in one plane. It has, for instance, both scout-observation planes and scout-bombers. The Curtiss SBC-4 scout and dive bomber has a top speed of about 250 miles an hour. The navy's bi-motor and four-motor heavy flying boats can reach slightly less than 200 miles an hour, but cruise on long flights at no more than three-fourths of that speed.

Consair Leads In Manufacture Of Big Planes

UNION 6-2-40

Consolidated Aicraft Corp.'s present expansion program—now being rushed to completion, with full manufacturing facilities estimated as completed by Aug. 1—brings this plant into full alignment with President Roosevelt's recently announced emergency defense program for building a vast number of aircraft, it was announced yesterday.

When completed, Consolidated Aircraft Corp. will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,440 square feet of contiguous airport land under option for further expansion. Ramp, airport and rail sidings are not included in these figures.

BACKLOG $70,000,000

Consolidated is unique in its possession of most favorable conditions surrounding its ascendancy as the largest aircraft plant in America, say plant officials.

Its backlog of more than $70,000,000 consists of U. S. government work, with a smaller proportion of its contracts for foreign deliveries. This leaves the company relatively free from any contingencies which might arise over the turn of events abroad, it was stated.

In undertaking its present plant expansion to enable it to meet this volume of business, an agreement was entered into between Consolidated and the U. S. treasury department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

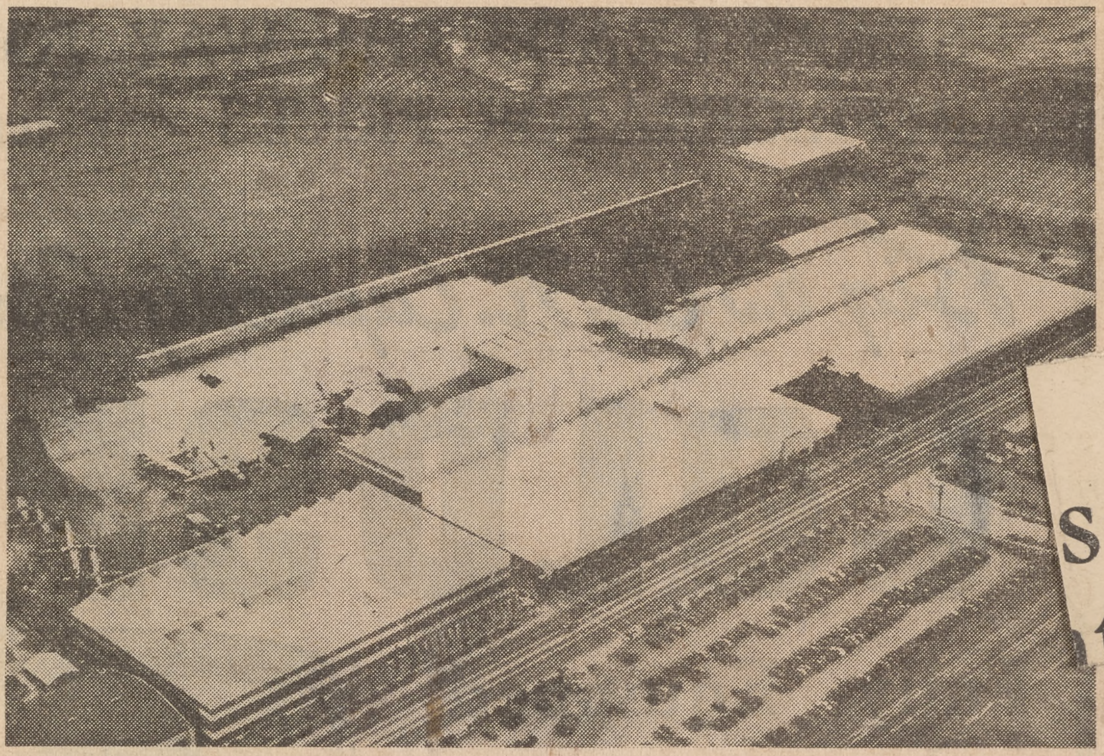
WORK OUTDOORS

Through the equitable climate of San Diego, fully 30 percent of the fanufacturing operations in building the planes may be conducted outdoors. Provision has been made for this by paving the plant yard area and providing suitable outlets for power lines, thus giving exceptional flexability in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made rapid advance to its present position, unobstrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft.

Taking as an arbitrary measure of 'bigness' the wing span of 100 feet or more, and including the plane equivalent of spares provided, Consolidated has constructed more than three times as many such planes as all other manufacturers combined.

FACTORY BUILDINGS LESS THAN FIVE YEARS OLD



All these factory buildings of the present Consolidated Aircraft Corp. plant are less than five years old. The final assembly building at the extreme right is nearing completion. When finished, the plant will be the largest integrated, covered and uncovered aircraft plant in America.

This includes those built in the World war. Since the company's advent in 1923, Consolidated has built nearly four times as many of such aircraft as all other U. S. manufacturers combined.

HOP TO HAWAII IN 1934.

As early as 1934, six Consolidated P2Y-1 twin-engined flying boats in the service of the navy flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop.

Phenomenal success followed the current model 28's, or navy PBY's, the largest twin-engine flying boats. With these planes scarcely off the line, the navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of 12 to 18 at a time.

Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Another 88 in groups of from 12 to 18 at a time, have been flown non-stop from San Diego to Coco Solo in the Canal Zone, a distance of 3087 miles. Aboard these planes were 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

BUILD 4-ENGINED CRAFT

Consolidated engineers have followed the highly successful model 28 design with the model 29, a huge four-engined craft built for the U. S. navy, and the model 31, a twin-engined flying boat boasting the first two radial air cooled engines of 2000 horsepower each, ever to be installed in a plane. Successfully tested, and known to exceed in range, speed and load-carrying capacity its forerunners the model 28's, the model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the model 32 four-engined land bomber as the army's XB-24 with an approximate gross weight of 40,000 pounds. Of this plane the army air corps recently stated:

"This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb-carrying capacity of four tons.

ORDERS TO TOTAL £5,000,000

By ROBERT WALLING
Our Air Correspondent

IT is reliably reported in American aviation circles that Britain has followed up the order for £2,000,000 worth of American Brewster single-seater fighters with an order for Douglas naval dive-bombers and about 50 Consolidated flying boats.

This brings the total value of American "active service" aircraft bought for the R.A.F. recently to about £7,000,000. This does not include trainers.

The Douglas dive-bombers—£2,500,000 worth—are DB-19s, the export version of the BT-1 type which is in general use in the U.S.A. Navy.

Two-Seat Monoplanes

They are two-seat monoplanes, powered by a 900-h.p. Pratt and Whitney engine. They have retractable undercarriages and constant-speed airscrews. But they are hardly likely to be faster than our Blackburn Skuas and Rocs which the Royal Navy use in the Fleet Air Arm.

It is not expected that they will be ready for delivery until the early autumn.

The Consolidated flying-boat ordered is the 28-5 type, a high-wing machine of 2000 horse-power which can carry a crew of six for 35 hours, and has a range of 4000 miles.

It is not fast—the cruising speed is 140 m.p.h.—but its range is among the highest in the world of civil or military aviation.

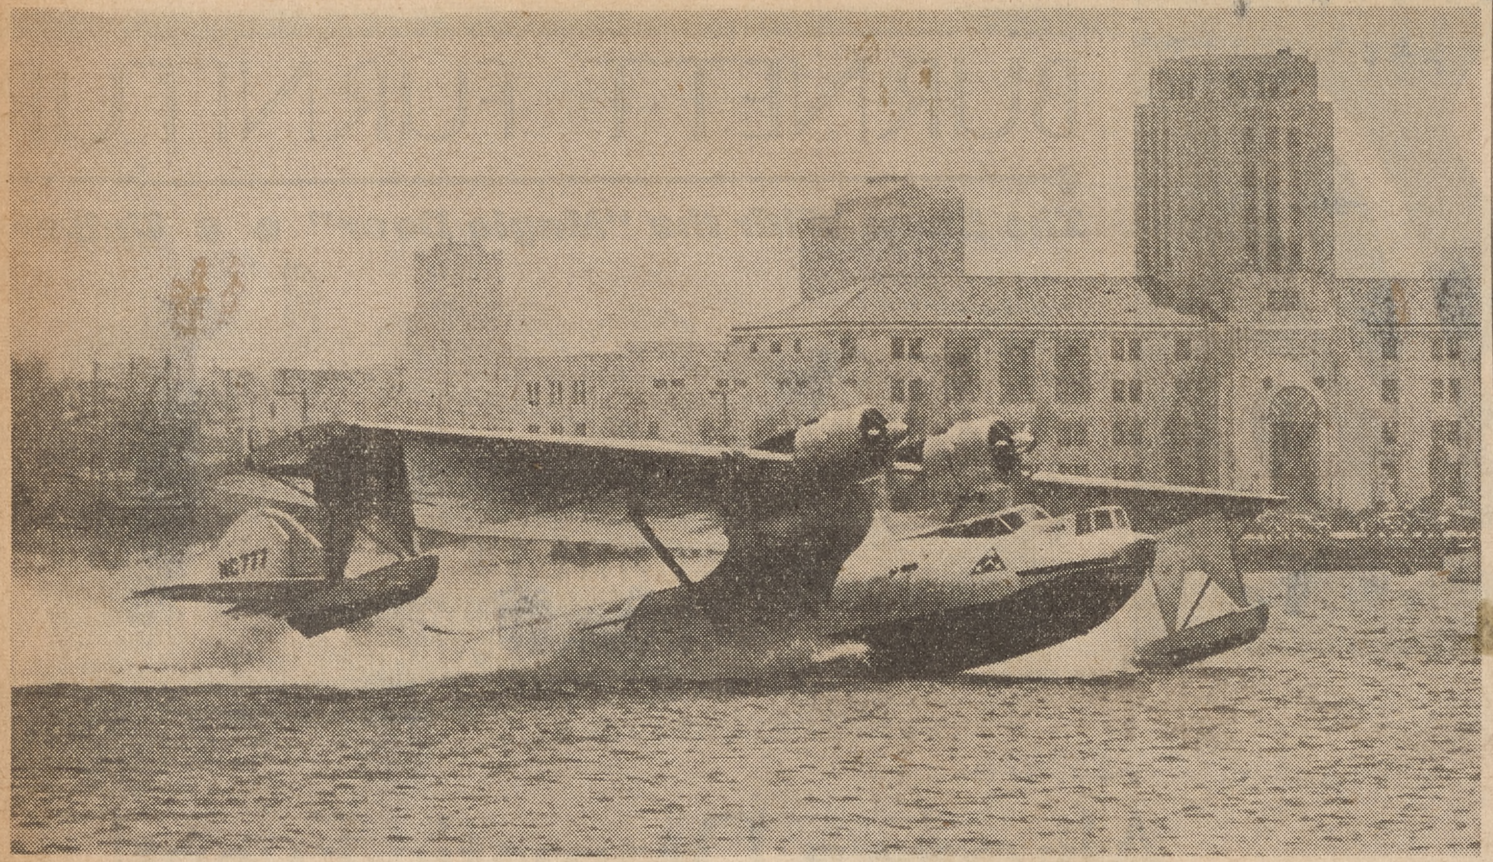
Flew Atlantic

Last summer the Air Ministry bought one of them, and it flew non-stop across the Atlantic from Botwood to Felixstowe—2450 miles—in 15½ hours. This particular flying-boat has already been on long-distance patrol, some of it in Northern waters, during the war.

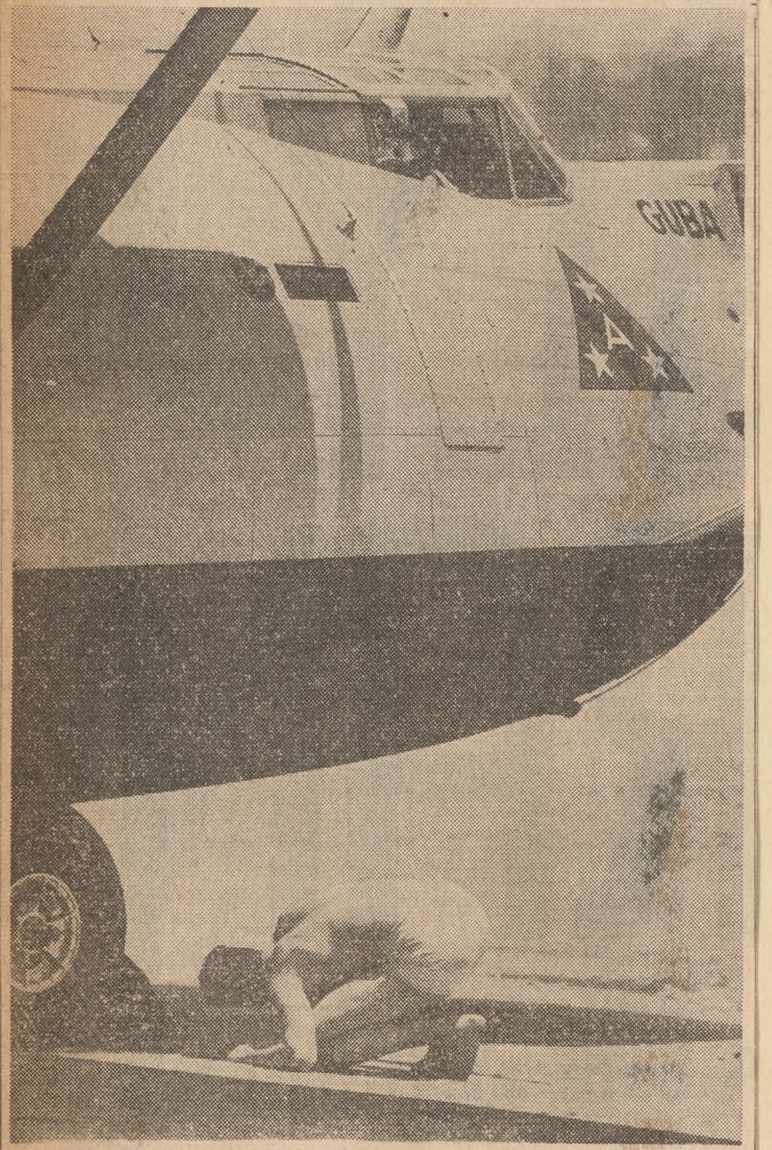
It has retractable wing-tip floats. These go up sideways into the wing-tips when the flying-boat is taking off from the water, thus reducing the drag when in flight.

THE SAN DIEGO UNION: SUNDAY MORNING, JULY 7, 1940

FAMED FLYING BOAT TAKES OFF ON TEST WITH 12 PASSENGERS, CREW OF 5



With spray cascading over wings and fuselage, the world-famed flying boat Guba takes off from San Diego bay abeam the Civic Center on a test flight to Lake Huntington, in the Sierras. Archbold's craft is carrying 12 passengers and a crew of five.



. . . attendant removes chock from Guba's wheels.

Guba Reaches Lake Huntington In 3-Hour Hop

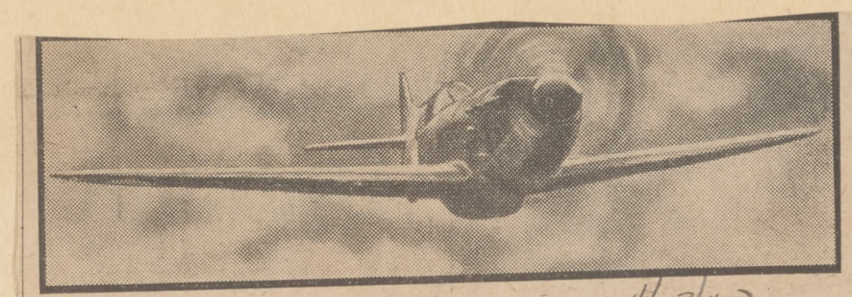
On a test flgiht before leaving here Tuesday for Port Washington, Long Island, Richard H. Archbold's famed San Diego-built flying boat Guba took off from the harbor at 11:26 a.m. yesterday and at 2:30 p.m. landed on Huntington lake in the Sierra Nevada mountains.

The Guba carried 12 passengers and a crew of five. At the controls were Russell Rogers and Douglas Kelley, who will pilot the big plane on its flight across the continent.

Rogers, the United Press reported, had difficulty landing the Guba on the mountain-ringed lake. Owing to the lake's great depth he was unable to use the plane's anchor. The Guba was moored to a small island and the passengers were taken ashore in motorboats. Huntington lake is 50 miles northwest of Fresno.

Barney Boyd, local radio amateur, who has maintained radio communication with the Guba on all its record breaking flights to and from Africa, Netherlands New Guinea and Australia, said he maintained a two-way conversation with Rogers on yesterday's flight. Boyd also will keep in constant contact on the Guba's flight to Port Washington. The Guba is expected to return here tomorrow afternoon.

Archbold, San Diego and New York scientist, is in the east.



London *Daily Express Air Reporter* 4/13/40

THIS single-seater fighter is the Spitfire of the French aircraft industry.

Large numbers of this type have been sent to the Western Front in the past few weeks.

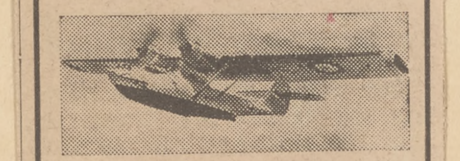
They are faster and probably more heavily armed than any other fighters, American or French, in France's air force.

Their distinctive features appear to be the slim fuselage and small wings.

They are the smallest fighters now on active service in any air force.

Monday's Quiz will tell what can be told about them up to now.

Yesterday's 4,000-mile range American flying - boat was a



CONSOLIDATED PBY

—with two 1,000 horse-power engines. The PBY is all metal, with a top speed of 206 miles an hour.

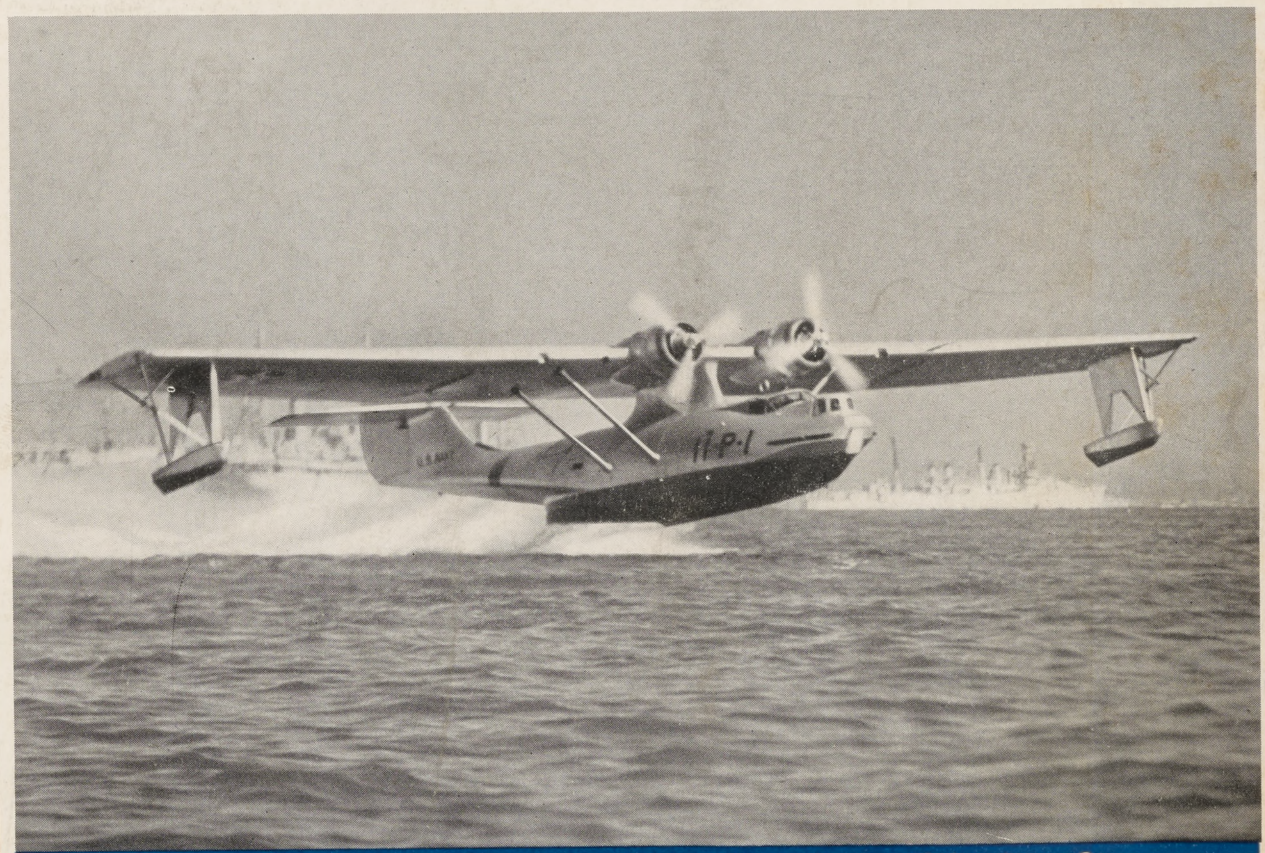
Its armament and war equipment for use with the R.A.F. are secret. But since war began these types of flying boats have operated anywhere between Iceland and the North Atlantic, either on northern blockade reconnaissance or convoy and on submarine patrol.

In the U.S. naval air arm similar types have flown around the world in record-making service formation flights.

WESTERN FLYING

FEB 5

February 1940 **25 Cents**



Famous for their mass flights to Alaska, Hawaii, the Philippines, Coco Solo, and Florida, the Navy's twin-engined Consolidated patrol bombers are now doing yeoman service in patrolling American territorial waters. Tried and true, this type has now won the largest procurement order in naval aviation history. And, like all their predecessors, the new PBY-5's will be powered by dependable Pratt & Whitney Twin Wasp engines.

PRATT & WHITNEY AIRCRAFT
EAST HARTFORD, CONNECTICUT
ONE OF THE THREE DIVISIONS OF UNITED AIRCRAFT CORPORATION

THE TRIBUNE-SUN, San Diego, Calif., Tuesday, June 4, 1940

Consair Plant To Be Largest in U. S. When Completed; Cite 17-Year Record

The following report on the progress being made towards Consolidated Aircraft Corp. becoming the largest aircraft plant in the United States was issued by Consair officals:

Consolidated Aircraft Corp., present expansion program, now being rushed to completion with full manufacturing facilities estimated as completed by Aug. 1 brings this plant into full alignment with the president's recently announced emergency defense program for building a vastly expanded number of aircraft. When completed, Consolidated Aircraft Corp. will have the largest integrated aircraft plant in America, with 1,910,000 square feet of covered and uncovered manufacturing space and 954,440 square feet of contiguous airport land under option for futher expansion if necessary. Ramp, airport and rail sidings are not included in these figures.

U. S. Planes in Backlog

Consolidated Aircraft Corp. is unique in its possession of most favorable conditions surrounding its ascendency as the largest aircraft plant in America.

The greater preponderance of its backlog now noted at over $70,000,000 consists of United States government work, with a small proportion of its contracts for foreign deliveries, leaving the company relatively free from any contingencies which might arise over the turn of events abroad.

In undertaking its present plant expansion to enable it to meet this volume of business, a closing agreement was entered into between Consolidated Aircraft Corp. and the United States treasury department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

Through the naturally equitable climate of San Diego, site of the huge plant, fully 30 percent of the manufacturing operations in building the planes may be conducted out of doors. Provision has been made for this by paving the entire plant yard area and providing suitable outlets for power-lines, etc., thus giving exceptional flexability in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made a most rapid advance to its present position, unobtrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft. Taking as an arbitary measure of "bigness" the wing span of 100 feet or more, and including the airplane equivalent of spares furnished, Consolidated has constructed more than three times as many such planes as all other manufacturers combined. This includes those built in the World war period. Since the company's advent in 1923, Consolidated has built approximately four times as many of such aircraft as all other United States manufacturers combined.

Successful Flights

As early as 1934, six Consolidated P2Y-1 twin engined flying boats in the service of the U. S. navy, flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop. Phenomenal success followed the current Model 28's, or United States navy PBY's the larger twin- flying boats. With these planes scarcely off the line the United States navy began a series of 'routine' delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of from 12 to 18 at a time. Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Another 88 in groups of from 12 to 18 at a time, have been flown non-stop from San Diego to Coco Solo in the Canal zone, a distance of 3087 miles. Aboard these planes were some 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

Consolidated engineers have followed the highly successful Model 28 design with the Model 29, a huge four-engined craft built for the United States navy, and the Model 31, a twin-engined flying boat boasting the first two radial aircooled engines of 2,000 horsepower each, ever to be installed in a plane. Successfully tested, and known to exceed in range, speed and load carrying capacity its forerunners the Model 28's, the Model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the Model 32 four-engined land bomber known as the United States army's XB-24, with an approximate gross weight of 40,000 pounds. Of this plane the United States army air corps recently stated, "This plane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles an hour, a range of approximately 3000 miles and a bomb-carrying capacity of approximately 4 tons."

World's 'Best' Planes U. S. Models In Drive to Goal of 50,000 in Year

Tribune - 6-15-40

(Editor's Note—How do our warplanes compare in types and performance with those of Europe? Here is the answer in a story by the aviation editor of the Special News Service of The Associated Press, who is on a tour of the leading American aviation manufacturing plants.)

By DEVON FRANCIS
Associated Press Aviation Editor

LOS ANGELES, July 15—The United States has some of the world's best warplanes to model on in setting up its factory production facilities for a drive to the goal suggested by President Roosevelt—50,000 machines a year.

Our problem in air rearmament is not so much plane performance is it is large production of both planes and pilots, with the scores of thousands of mechanics to service the planes once they are produced.

We have the necessary planes in types. The idea has been advanced in recent weeks that we have, in fact, too many good types—that we need a simplification of types to assure high factory productivity. A factory can reach its maximum production only if it concentrates on the manufacture of one or two standard models.

Germany introduced a new note into aerial warfare when it sent planes by the hundreds into battle on the assumption that a certain percentage of them was "expendable," like infantrymen. Some of those German planes are not of superlative performance. The German "Stukas," used for dive bombing, for instance, have a top speed of only 220 miles an hour. The famous German single-engine fighter, the Messerschmitt "109," has a level-flight top speed of about 310 miles an hour, considerably short of the performance of two of our fighters, the Curtiss P-40 (top speed 365 miles an hour) and the Bell P-39 (375 miles an hour).

Exceeded in Performance

Two of our newest dive bombers, the Vought-Sikorsky XF4U-1 shipboard fighter and the Curtiss SBC-4, exceed the Stuka in performance, but whereas Germany has Stukas in quantities great enough to throw them into battle in expectation of considerable losses we have only a few score in old and new types.

The Vought-Sikorsky prototype still is being tested for the navy, and the Curtiss type is only getting into production.

Incidentally, the United States navy originated the technique of dive-bombing. Germany adapted the idea to its own use.

In spite of limited research facilities in the United States, American warplanes of "service" caliber frequently have led the rest of the world in performance. Russia excepted, we probably have the world's largest and most efficient long-range, heavy bombing planes, exemplified in the Boeing four-motor and the new Consolidated B-24 four-motor bombing types. The first is made in Seattle, the second in San Diego.

Our Lockheed P-38 bi-motored interceptor, a new type in our army, is designed solely to fight bombing planes. It has a high rate of climb and a high speed of 405 miles an hour.

Our "light bombardment" planes, designed for attacking troops, have a high speed of 395 miles an hour with a bomb load of 2400 pounds. Unlike the Stukas, however, these planes, known as the Curtiss A20's, do not dive on their objectives.

Our medium-weight bombers, such as the Douglases and Martins, are at least the equal of any similar aircraft abroad. The development of bombardment types is part and parcel of a high command's tactical plans.

Two New Types Considered

Our heavy bombardment planes are designed for use against the warships, aircraft carriers and troop transports of any invader.

There is talk now in the American aircraft industry of two new types of aircraft for the Army Air corps—an inexpensive, short-range "baby" fighting plane, made in great quantities for "local" defense, and large numbers of dive bombers for the same tactical use to which Germany is putting its Stukas.

Reduction in cost also is receiving serious study. If one of our four-motored bombers were shot down attacking an enemy fleet, it would mean a loss of $400,000, counting both plane and armament. Each of our pursuits costs from $60,000 to $70,000.

The navy has two general types of planes, each operating intimately with surface units. The navy's shipborne and land-based aircraft are slower than similar air corps planes and enjoy less freedom of action.

Because the navy must make the maximum use of its limited facilities on the aircraft carriers, it often combines several functions in one plane. It has, for instance, both scout-observation planes and scout-bombers. The Curtiss SBC-4 scout and dive bomber has a top speed of about 250 miles an hour. The navy's bi-motor and four-motor heavy flying boats can reach slightly less than 200 miles an hour, but cruise on long flights at no more than three-fourths of that speed.

Consair Leads In Manufacture Of Big Planes

UNION 6-2 40

Consolidated Aicraft Corp.'s present expansion program—now being rushed to completion, with full manufacturing facilities estimated as completed by Aug. 1—brings this plant into full alignment with President Roosevelt's recently announced emergency defense program for building a vast number of aircraft, it was announced yesterday.

Ramp, airport and rail sidings are not included in these figures.

BACKLOG $70,000,000

Consolidated is unique in its possession of most favorable conditions surrounding its ascendancy as the largest aircraft plant in America, say plant officials.

Its backlog of more than $70,000,000 consists of U. S. government work, with a smaller proportion of its contracts for foreign deliveries. This leaves the company relatively free from any contingencies which might arise over the turn of events abroad, it was stated.

In undertaking its present plant expansion to enable it to meet this volume of business, an agreement was entered into between Consolidated and the U. S. treasury department. This agreement provides that the cost of certain addition excess production facilities, less depreciation, required to meet deliveries may be charged to the cost of performing contracts received by the company, in effect amortizing much of its expansion.

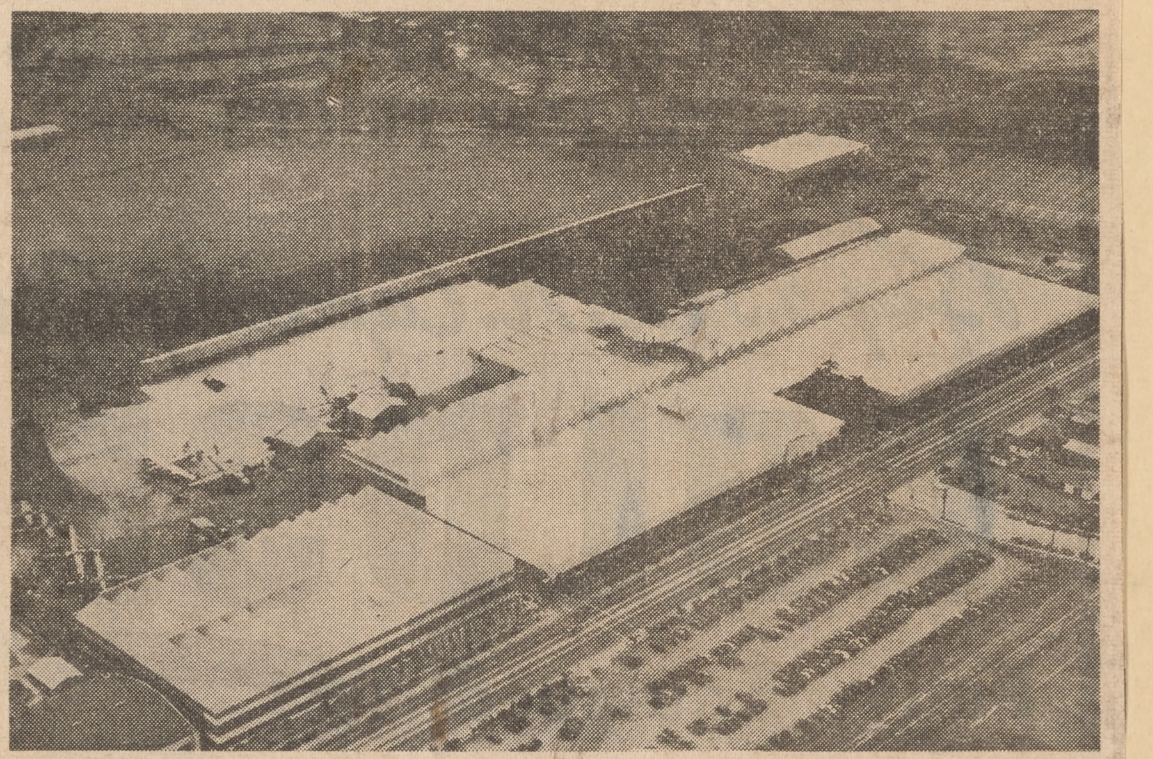
WORK OUTDOORS

Through the equitable climate of San Diego, fully 30 percent of the fanufacturing operations in building the planes may be conducted outdoors. Provision has been made for this by paving the plant yard area and providing suitable outlets for power lines, thus giving exceptional flexability in an industry now in the flux of rapid development.

Founded in 1923, Consolidated has made rapid advance to its present position, unobstrusively becoming the world's largest manufacturer of flying boats as one of its interesting achievements. Because the performances of flying boats are not usually as spectacular as those of smaller planes or land planes of comparable size, this rise to first position has not been noted by the public generally, nor has the company's specialization upon larger craft.

Taking as an arbitrary measure of 'bigness' the wing span of 100 feet or more, and including the plane equivalent of spares provided, Consolidated has constructed more than three times as many such planes as all other manufacturers combined.

FACTORY BUILDINGS LESS THAN FIVE YEARS OLD



All these factory buildings of the present Consolidated Aircraft Corp. plant are less than five years old. The final assembly building at the extreme right is nearing completion. When finished, the plant will be the largest integrated, covered and uncovered aircraft plant in America.

This includes those built in the World war. Since the company's advent in 1923, Consolidated has built nearly four times as many of such aircraft as all other U. S. manufacturers combined.

HOP TO HAWAII IN 1934.

As early as 1934, six Consolidated P2Y-1 twin-engined flying boats in the service of the navy flew the first successful massed flight from San Francisco to Hawaii, a distance of 2414 miles, non-stop.

Phenomenal success followed the current model 28's, or navy PBY's, the largest twin-engine flying boats. With these planes scarcely off the line, the navy began a series of "routine" delivery flights non-stop from San Diego to Hawaii, a distance of 2553 miles, with the planes flying in groups of 12 to 18 at a time.

Eighty-eight of these ships to date have made this "routine jump" to Hawaii. Another 88 in groups of from 12 to 18 at a time, have been flown non-stop from San Diego to Coco Solo in the Canal Zone, a distance of 3087 miles. Aboard these planes were 1200 men, members of their regular crews. No untoward incidents were encountered on any of these flights.

BUILD 4-ENGINED CRAFT

Consolidated engineers have followed the highly successful model 28 design with the model 29, a huge four-engined craft built for the U. S. navy, and the model 31, a twin-engined flying boat boasting the first two radial air cooled engines of 2000 horsepower each, ever to be installed in a plane. Successfully tested, and known to exceed in range, speed and load-carrying capacity its forerunners the model 28's, the model 31's performance figures are being carefully shielded because of their military potency.

Re-entry of Consolidated into the land plane field is marked by the model 32 four-engined land bomber as the army's XB-24 with an approximate gross weight of 40,000 pounds. Of this plane the army air corps rec[illegible]ly stated:

"This airplane, from preliminary investigations, gives evidence of living up to the advancements in aerodynamic and performance characteristics predicted. These include a speed of over 300 miles per hour, a range of approximately 3000 miles and a bomb-carrying capacity of four tons.

London Evening Standard 4/13/40

R.A.F. Buying U.S.A. Dive-bombers

NEW ORDERS TO TOTAL £5,000,000

By ROBERT WALLING
Our Air Correspondent

IT is reliably reported in American aviation circles that Britain has followed up the order for £2,000,000 worth of American Brewster single-seater fighters with an order for Douglas naval dive-bombers and about 50 Consolidated flying boats.

This brings the total value of American "active service" aircraft bought for the R.A.F. recently to about £7,000,000. This does not include trainers.

The Douglas dive-bombers—£2,500,000 worth—are DB-19s, the export version of the BT-1 type which is in general use in the U.S.A. Navy.

Two-Seat Monoplanes

They are two-seat monoplanes, powered by a 900-h.p. Pratt and Whitney engine. They have retractable undercarriages and constant-speed airscrews. But they are hardly likely to be faster than our Blackburn Skuas and Rocs which the Royal Navy use in the Fleet Air Arm.

It is not expected that they will be ready for delivery until the early autumn.

The Consolidated flying-boat ordered is the 28-5 type, a high-wing machine of 2000 horse-power which can carry a crew of six for 35 hours, and has a range of 4000 miles.

It is not fast—the cruising speed is 140 m.p.h.—but its range is among the highest in the world of civil or military aviation.

Flew Atlantic

Last summer the Air Ministry bought one of them, and it flew non-stop across the Atlantic from Botwood to Felixstowe—2450 miles—in 15½ hours. This particular flying-boat has already been on long-distance patrol, some of it in Northern waters, during the war.

It has retractable wing-tip floats. These go up sideways into the wing-tips when the flying-boat is taking off from the water, thus reducing the drag when in flight.

VISTA, CALIFORNIA, THURSDAY, JULY 4, 1940

Great Aircraft Plant Employs Thousands

Anticipating a backlog of orders which "probably will exceed $100,000,000" Consolidated Aircraft Corporation is rushing completion on a vast expansion program, Maj. Edgar N. Gott, Consolidated vice president, told more than thirty editors, publicists and advertising men of the county at a meeting of the San Diego chamber of commerce publicity committee in San Diego Friday night.

Maj. Gott's address preceded a visit by the group to the plant where mass production of giant fighting craft was viewed.

Although the meeting theme centered around aircraft expansion in this area and plans for future development, Maj. Gott joined Maj. T. C. Macauley, chamber secretary-manager, in warning that "every possible step should be taken to rid this county of subversive elements seeking to retard national preparedness and to undermine this nation's democracy."

Largest Plant

The tremendous expansion program currently being rushed to completion at Consolidated Aircraft Corporation, which is already by far the largest county manufacturing enterprise, will give San Diego the distinction of having the largest integrated

Aircraft Plant

(Continued from First Page)

the newest and finest plants in all the world.

Well Equipped

Rounding out its complement of equipment, some of the finest machine tools available in the market today have, and will be installed as the program progresses. Lathes, automatic screw machines, shapers, millers, die sinkers, planers, punchpresses, hydraulic presses, drop hammers, power shears and brakes and smaller electric and pneumatic tools in almost unlimited number are included. These machines are being operated by men rapidly learning the newest time saving features of this splendid equipment.

At the present moment, approximately 750 of the more than 7,000 skilled aircraftmen are engaged in tool design and production, and the making of patterns which supplement the machine tools with special equipment; providing jigs, patterns and templates, assembly fixtures and the multitude of special tools required to assist the workmen to produce the finest airplanes possible.

Consolidated's present position, and outlook for the future, bids fair to exert a marked influence on the growth of San Diego county. Concluding a statement to the plant personnel on the recent advent of the Consolidated Aircraft Corporation's 17th birthday, President Major Reuben H. Fleet said, "We have a good organization—equal to any in our industry—the best in our history. So in counting our blessings let us consider that we have a factory of our own, tailored for our business, in the city of our choice, with plenty of work on hand and in sight, and no mortgage on our premises or our future. In one sense I regret that we are too busy to celebrate."

Vultee Voting on Union; Seek Election at Ryan

Vultee Aircraft's 2400 employes today voted in a national labor relations board election, in the first move in the C.I.O.-United Auto Workers' campaign to obtain collective bargaining rights over approximately 50,000 workers in California plane plants, The Associated Press reported from Downey. A petition for a similar election at the Ryan Aeronautical Co., San Diego, is reported before the board on C.I.O. initiative. The only plant in southern California where the NLRB has desigated a bargaining agent is Consolidated Aircraft, San Diego, where the A.F.L. won an election.

Defer Consair Land O.K. As Water St. Studied

Pending a decision on practicability of making a two-way highway along Water st. from Barnett ave. to Harasthy st., the harbor commission yesterday held in abeyance a request of Consolidated Aircraft Corp. to take over an area 1400 feet by 300 feet west of the existing Consair plant. The firm now has an option for additional land to increase facilities of the plant. Water st. lies west of Pacific highway and is a part of newly reclaimed tidelands. While the city planning commission intends to recommend the street be extended, the commission was advised the marine corps base has plans for erecting buildings and laying railroad tracks in the area through which the street would run. If the street is extended, it would cut into Pacific highway immediately north of Bean st.

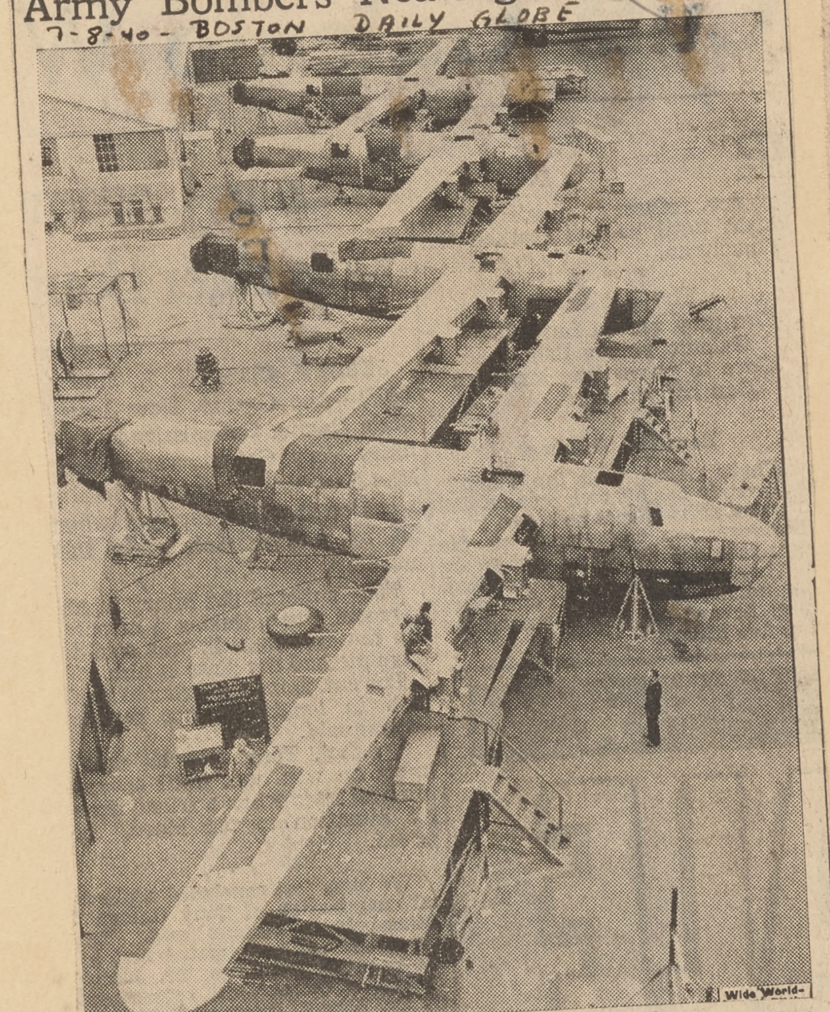
Army Bombers Nearing Completion

7-8-40 - BOSTON DAILY GLOBE



At San Diego, Calif., rapidly nearing completion, these four-motored Army Air Corps bombers, designated as the XB-24, are pictured on the final assembly line at the Consolidated Aircraft Corporation. Powered with four 1200 h. p. motors, the planes are said to have a large cruising range, to be very fast and carry heavy armament with a crew of nine persons. These planes have been released for export, and it is reported that they will be shipped to Britain. (Photo passed by Army Air Corps censor.)

Union -- May 9, '40

Aviation Training Vital Need, Says Adm. Blakely

Aviation personnel will play as vital a role in national defense as any other phase, Rear Adm. C. A. Blakely, 11th Naval district commandant, told the San Diego Aero club at its dinner meeting last night.

"Whether or not we attain the goal of 50,000 planes," Adm. Blakely said, "if we stimulate sufficient interest in aviation and obtain an adequate force of trained pilots we will have taken a big step forward in the matter of national defense."

He called attention to the known fact that a large ground crew is needed for every craft kept in flying condition, and that in active service three or four pilots are needed for every plane for full fighting efficiency.

RECALLS PREDICTION

The possession and maintenance of a large reserve of competent fliers are of key importance in modern warfare, Adm. Blakely said, and this will be one of the deciding factors in the present European conflict.

The admiral recalled the skepticism with which a forecast of his in 1910 was greeted. He predicted at that time that planes might be used to good advantage in the naval service, and that some day they might even be able to land and take off from ships.

Adm. Blakely not only saw this prophecy come true, but took an active part in shaping its fulfillment. He commanded the aircraft carrier Lexington and later was in command of battle force aircraft, comprising all the carriers and their complements. He took the naval pilot training course at Pensacola, Fla., when he was 50 years old.

In expressing his belief in the need of universal military service, Adm. Blakely said he did not mean by this the shouldering of a rifle by every man but the training of all able-bodied men for one of the many branches and supporting elements of military organization. Aviation would, he said, require a fair share of such trained personnel.

SEEKING NEW SITE

Another speaker was Maj. E. N. Gott, vice president of Consolidated Aircraft Corp., who outlined the development of that plant. He said that in scouting the midwest for a possible site for a sub-assembly plant, in keeping with the government's wish to direct further expansion inland, he told offiicals that the firm "had been spoiled" by the ideal circumstances and cooperative treatment in San Diego.

Gott said a comparatively small part of the present $75,000,000 backlog of orders is for delivery to "the Ally," meaning Britain, the rest being for the United States defense. He expressed the hope that the "one Ally" would be able to accomplish more than the plural combination.

Earl Prudden, club president and vice president of the Ryan School of Aeronautics, introduced the speakers. He mentioned that Fulton Lewis jr., nationally known commentator, had visited San Diego Sunday to inspect the aircraft production facilities here and had devoted his daily radio broadcast to his findings.

AIR CHIEF ARRIVES

Brig. Gen. Barton K. Yount, assistant chief of the army air corps, had been expected to attend the dinner but did not arrive in time. He came to San Diego to inspect primary training facilities at the Ryan school. In an interview, he said aviation cadets soon will receive their full training in California.

A civilian airport at Stockton, he said, will be converted into an advanced training school similar to that at Randolph field, Tex., and Moffett field, Sunnyvale, will become a tactical school like that at Kelly field, Tex. Heretofore all California student fliers have been sent to Texas for final training.

ARCHBOLD, CREW OF 'GUBA' WIN NEW HONORS FROM SAN DIEGANS

A dinner, honoring Richard Archbold, flying explorer and research associate of the American Museum of Natural History, and his crew of the Guba, was held the evening of May 13 at the Hotel San Diego, San Diego, California, with over 100 persons attending, including members of the San Diego Chapter of the National Aeronautic Association and speakers representing the Army, Navy, Coast Guard, City of San Diego and the Chamber of Commerce.

Major Reuben H. Fleet, life member of the National Aeronautic Association and president of the Consolidated Aircraft Corporation, presented Archbold and his crew with a scroll from the N.A.A., outlining his aerial achievements in the Guba; and Earl D. Prudden, president of the Aero Club of San Diego (N.A.A. Chapter), presented him with a beautiful gold trophy on behalf of that Chapter.

Members of the Guba crew are Russell Rogers, chief pilot; Gerald Brown and Stephen Barrinka, engineers; Raymond Booth, radioman; and the late Captain Lewis Yancy, navigator. Archbold and his crew were the first to circumnavigate the world in a flying boat; the first to circumnavigate the world at its maximum diameter; the first to fly across the Indian ocean; and the first to make a non-stop flight across Australia.

Edgar N. Gott, Consolidated Aircraft's vice-president married Miss Madie Koenig, Los Angeles, Calif. Ceremony held May 2 at home of John H. Jouett, president, Aeronautical Chamber of Commerce, in Washington. Best man was Maj. Gen. H. H. Arnold, Army Air Corps chief.

Great Aircraft Plant Employs Thousands

Anticipating a backlog of orders which "probably will exceed $100,000,000" Consolidated Aircraft Corporation is rushing completion on a vast expansion program, Maj. Edgar N. Gott, Consolidated vice president, told more than thirty editors, publicists and advertising men of the county at a meeting of the San Diego chamber of commerce publicity committee in San Diego Friday night.

Maj. Gott's address preceded a visit by the group to the plant where mass production of giant fighting craft was viewed.

Although the meeting theme centered around aircraft expansion in this area and plans for future development, Maj. Gott joined Maj. T. C. Macauley, chamber secretary-manager, in warning that "every possible step should be taken to rid this county of subversive elements seeking to retard national preparedness and to undermine this nation's democracy."

Largest Plant

The tremendous expansion program currently being rushed to completion at Consolidated Aircraft Corporation, which is already by far the largest county manufacturing enterprise, will give San Diego the distinction of having the largest integrated covered and uncovered aircraft manufacturing plant in America. Consolidated's manufacturing space, exclusive of field, ramp and railroad sidings, now occupies over 1,910,000 square feet of area or an 87 per cent increase over the previous figure, with an option on adjacent land equal to an added 50 percent of this area, plans are nearly completed for its possible use.

This expansion thus brings the local plant into full step with the President's recently announced national defense program, and helps to place San Diego in the forefront of the drive to produce the stated 50,000 plane output per year.

Already operating with a present backlog in excess of $70,000,000, contracts for additional work are being negotiated which, if accepted, will build this huge backlog for San Diego's concern to well over $100,000,000. Roughly one half of this sum will be expended locally, and this largely through wages to employees, exerting a marked stimulus to local business of a purely beneficial nature, since the plant's operations do not draw upon the community's wealth, other than its climate. A distinct climatic advantage is the fact that approximately 30 per cent of the manufacturing operations can be conducted out of doors, thus paying health dividends to the employees as well as convenience to the company.

Plant Immense

Thoroughly modern in construction and planning, Consolidated's huge plant utilizes all the latest features of aircraft plant design. The plant now extends for a half mile along Pacific Highway, and the new Final Assembly building at the north end of the plant is more than a city block in size with its tremendous roof held high in the air with remarkably few supporting columns. This construction allows exceptional manufacturing freedom within. A three story structure, the size of an average three story office building of the business district, is housed under the roof of this final assembly building, and a dozen more such structures could be placed under its roof without crowding.

Sawtooth roof construction affords north lighting during the daylight hours. Adequate artificial lighting is provided for the night workers. The plant is now operating three shifts. It is not difficult to appraise the fact that the entire plant is streamlined for the most efficient production and the greatest convenience to the workmen in all necessary facilities provided; for all its huge buildings, and most of its equipment, are less than five years old today. This marks it as one of

Aircraft Plant

(Continued from First Page)

the newest and finest plants in all the world.

Well Equipped

Rounding out its complement of equipment, some of the finest machine tools available in the market today have, and will be installed as the program progresses. Lathes, automatic screw machines, shapers, millers, die sinkers, planers, punchpresses, hydraulic presses, drop hammers, power shears and brakes and smaller electric and pneumatic tools in almost unlimited number are included. These machines are being operated by men rapidly learning the newest time saving features of this splendid equipment.

At the present moment, approximately 750 of the more than 7,000 skilled aircraftmen are engaged in tool design and production, and the making of patterns which supplement the machine tools with special equipment; providing jigs, patterns and templates, assembly fixtures and the multitude of special tools required to assist the workmen to produce the finest airplanes possible.

Consolidated's present position, and outlook for the future, bids fair to exert a marked influence on the growth of San Diego county. Concluding a statement to the plant personnel on the recent advent of the Consolidated Aircraft Corporation's 17th birthday, President Major Reuben H. Fleet said, "We have a good organization—equal to any in our industry—the best in our history. So in counting our blessings let us consider that we have a factory of our own, tailored for our business, in the city of our choice, with plenty of work on hand and in sight, and no mortgage on our premises or our future. In one sense I regret that we are too busy to celebrate."

Vultee Voting on Union; Seek Election at Ryan

Vultee Aircraft's 2400 employes today voted in a national labor relations board election, in the first move in the C.I.O.-United Auto Workers' campaign to obtain collective bargaining rights over approximately 50,000 workers in California plane plants, The Associated Press reported from Downey. A petition for a similar election at the Ryan Aeronautical Co., San Diego, is reported before the board on C.I.O. initiative. The only plant in southern California where the NLRB has desigated a bargaining agent is Consolidated Aircraft, San Diego, where the A.F.L. won an election.

Defer Consair Land O.K. As Water St. Studied

Pending a decision on practicability of making a two-way highway along Water st. from Barnett ave. to Harasthy st., the harbor commission yesterday held in abeyance a request of Consolidated Aircraft Corp. to take over an area 1400 feet by 300 feet west of the existing Consair plant. The firm now has an option for additional land to increase facilities of the plant. Water st. lies west of Pacific highway and is a part of newly reclaimed tidelands. While the city planning commission intends to recommend the street be extended, the commission was advised the marine corps base has plans for erecting buildings and laying railroad tracks in the area through which the street would run. If the street is extended, it would cut into Pacific highway immediately north of Bean st.

Aviation Training Vital Need, Says Adm. Blakely

Aviation personnel will play as vital a role in national defense as any other phase, Rear Adm. C. A. Blakely, 11th Naval district commandant, told the San Diego Aero club at its dinner meeting last night.

"Whether or not we attain the goal of 50,000 planes," Adm. Blakely said, "if we stimulate sufficient interest in aviation and obtain an adequate force of trained pilots we will have taken a big step forward in the matter of national defense."

He called attention to the known fact that a large ground crew is needed for every craft kept in flying condition, and that in active service three or four pilots are needed for every plane for full fighting efficiency.

RECALLS PREDICTION

The possession and maintenance of a large reserve of competent fliers are of key importance in modern warfare, Adm. Blakely said, and this will be one of the deciding factors in the present European conflict.

The admiral recalled the skepticism with which a forecast of his in 1910 was greeted. He predicted at that time that planes might be used to good advantage in the naval service, and that some day they might even be able to land and take off from ships.

Adm. Blakely not only saw this prophecy come true, but took an active part in shaping its fulfillment. He commanded the aircraft carrier Lexington and later was in command of battle force aircraft, comprising all the carriers and their complements. He took the naval pilot training course at Pensacola, Fla., when he was 50 years old.

In expressing his belief in the need of universal military service, Adm. Blakely said he did not mean by this the shouldering of a rifle by every man but the training of all able-bodied men for one of the many branches and supporting elements of military organization. Aviation would, he said, require a fair share of such trained personnel.

Plane Company Plans Branch

Consolidated Seeking Inland Site but Denies Main Factory to Move

Consolidated Aircraft Corp. is seeking an eastern or middle western site for a branch factory to augment its plant in San Diego. Contrary to reports from the East, it is not considering moving its main plant to Dallas.

These disclosures were made yesterday by a company spokesman who explained that a site for the supplementary plant in the interior would be considered less vulnerable than the coastal factory.

PLANT EXPANSION

Consolidated's San Diego facilities are in the midst of a $2,000,000 expansion program which will increase the floor space 90 per cent by Aug. 1.

Although Maj. Reuben H. Fleet, president, was in Texas last week, presumably examining sites for the branch plant, the company spokesman denied reports that a lakeshore area near Dallas had been chosen.

LOCKHEED DENIAL

Robert E. Gross, president of Lockheed Aircraft Corp. in Burbank, simultaneously denied another report that Lockheed intends to move to Dallas for national defense reasons. "Nothing to it," he said flatly.

Great Britain's Air Vice-Marshal, Henry Meyrick Cave-Browne-Cave, inspected the Lockheed and Consolidated plants yesterday, checking progress on orders totaling $85,000,000.

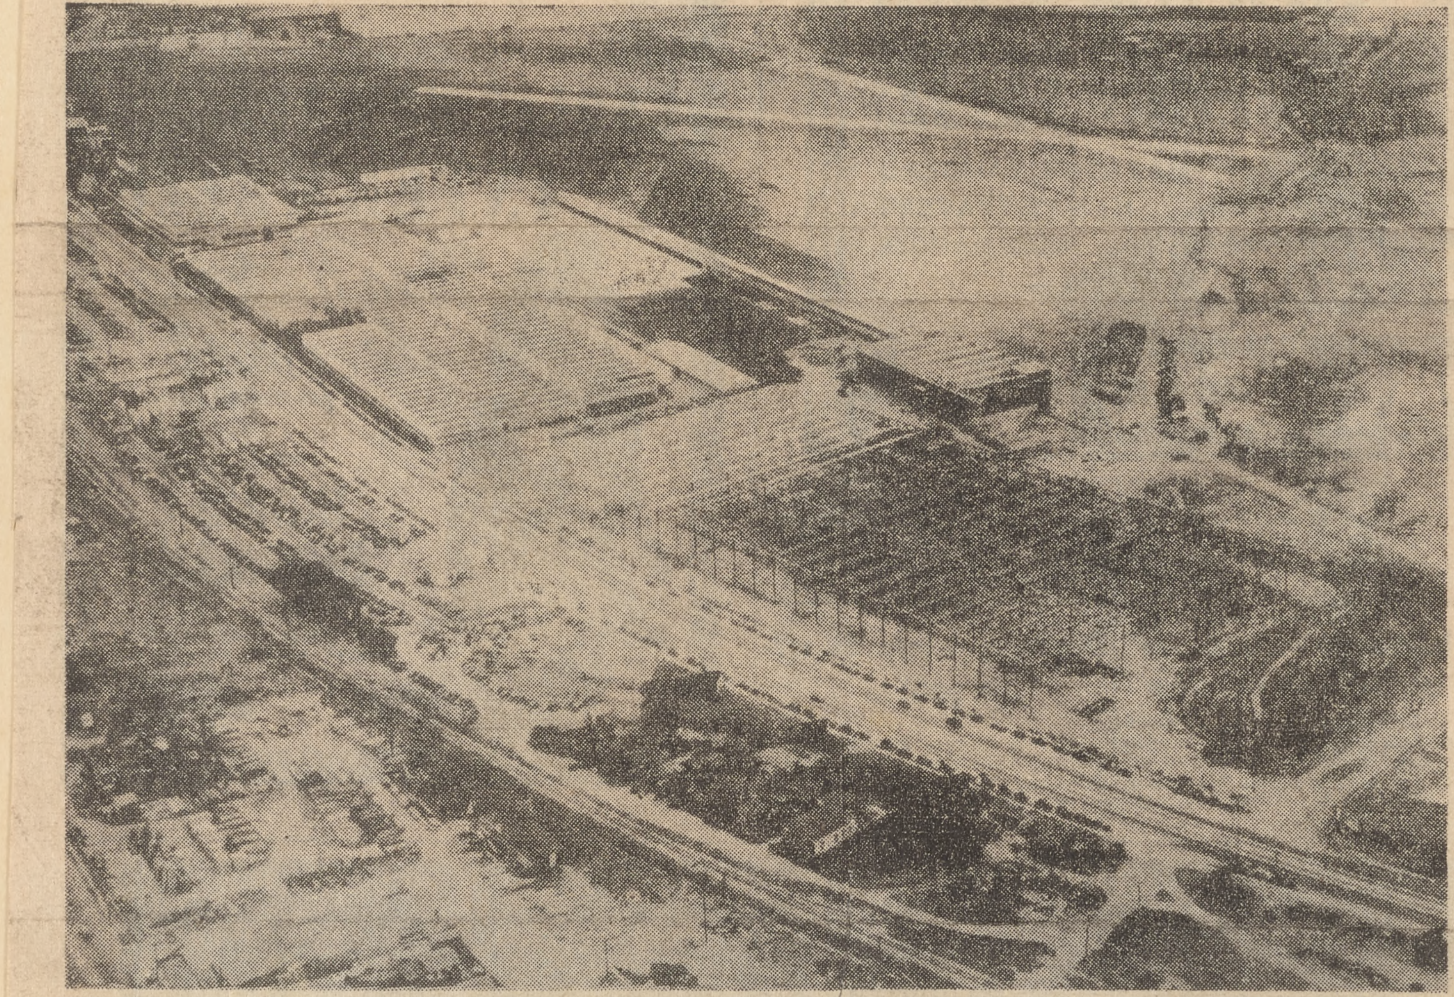
CORREIO DA MANHÃ — Quarta-feira, 26 de Junho de 1940

A AVIAÇÃO

MILITAR, COMMERCIAL E CIVIL

RIO DE JANEIRO

INFORMAÇÕES DO PAIZ E DO ESTRANGEIRO



Uma vista das installações gigantescas e da construcção das salas de montagem da Consolidated Aircraft. Quasi todas as grandes fabricas norte-americanas trabalham nas mesmas proporções para attender ás neccessidades urgentes da aviação militar e naval dos Estados Unidos

O presente programma de expansão da Consolidated Aircraft Corporation, no qual se trabalha com afinco, e que, presume-se, será acabado nos primeiros dias de agosto, está perfeitamente de accordo com o programma do presidente Roosevelt, tendo em vista construir um grande numero de aviões para attender ás necessidades do momento.

Quando a sua fabrica fôr terminada, a Consolidated Aircraft Corporation possuirá a maior fabrica aeronautica da America, com uma área edificada ou não de 1.910.000 pés quadrados, e 954.440 p. q. de aeroporto, com opção para compra em caso de necessidade, em vista de ulterior expansão.

A rampa, o aeroporto, os desvios não estão incluidos nos algarismos citados.

A C. A. C. goza de condições unicas para attender a sua ascensão como maior fabrica aeronautica na America.

A maior parte de suas encommendas, que montam a .... $70.000.000, consiste em obras por conta do governo dos Estados Unidos, com uma proporção menor de contratos para paizes estrangeiros, deixando a Companhia relativamente isenta de quaesquer contingencias que possam advir, conforme o decorrer dos acontecimentos exteriores.

Quando emprehendeu o presente programma de expansão, para poder attender a encommendas do governo, a C. A. C. entrou num estreito entendimento com o Thesouro dos Estados Unidos. O accordo prevê que o custo de certos melhoramentos indispensaveis para attender ás entregas poderiam ra attender ás entregas poderia ser addiccionado ao preço dos afim de amortizar boa parte dos melhoramentos.

No meio do clima naturalmente suave de San Diego, onde está situada esta importante fabrica — trinta por cento no minimo das operações de construcção do material aeronautico podem ser feitos ao ar livre. O necessario foi feito para a pavimentação da totalidade da area da fabrica, tomando providencias para a protecção do material de montagem das cadeias, dando assim uma grande possibilidade de acção á industria agora em pleno desenvolvimento.

Fundada em 1932, a Consolidated Aircraft chegou rapidamente á sua situação actual, tomando posição privilegiada entre os grandes constructores de hydro-aviões, gozando no mundo de uma fama comparavel á de Latecoêre

Tomando como base para os calculos de seus apparelhos uma envergadura de 100 pés no minimo, ella especializou-se em apparelhos de grande porte.

Em 1934, seis Consolidated P2 YI da U. S. Navy realizaram o primeiro vôo de grupo importante entre San Francisco e Hawai, voando uma distancia da 2.414 milhas sem escala.

Um dos maiores successos de engenharia conhecidos até hoje é o Consolidated Model 28 que é ainda — com o Model 31 — maior bimotor da U. S. Navy e que na occasião das entregas dos apparelhos de série as bases as mais distantes realizaram vôos em grupos notaveis como o de 88 M. 28 que voaram em esquadrilhas de 18 ou 20 de San Diego ao Canal de Panamá — ou assim seja uma distancia de cerca de 3.000 milhas, levando uma tripulação total de 1.200 homens. Nenhum incidente digno de nota occorreu durante essas manobras.

Ao Model 28 succederam o Model 29 um gigantesco quadrimotor hydro-avião e o Model 31 — o famoso bimotor de trinta toneladas no qual pela primeira vez foi installado um grupo moto-propulsor duplo de 2.000 c. v. assim como o famoso perfil de asa Lavis que permitte asas enormes — de grande envergadura e pequena largura relativa.

Esse anno emfim, tornando novamente as suas actividades para os apparelhos terrestres, a Consolidated Aircraft construiu o famoso quadrimotor de bombardeio especie de nova Fortaleza Voadora aperfeiçoada adoptado pela U. S. Army sob o indicativo X. B. 24 e que representa um importante progresso aerodynamico sobre os aviões americanos actuaes, tendo um raio de acção de cerca de 4.000 kilometros com carga de quatro toneladas de bombas e uma velocidade de 480 kilometros a hora.

Guba Will Leave Friday for East

British May Use Craft as Bomber

On a sustained flight to Port Washington, Long Island, with a possibility it later may be purchased by Britain and added to the Royal Air force bombing fleet, Richard Archbold's famed Consolidated-built flying boat Guba is to take off from the harbor Friday afternoon, 2:30.

Crew of the Guba will include Russell Rogers, who has been at the controls in all its record-breaking flights to Africa and Netherlands, New Guinea; Douglas Kelley, veteran local flier, who will act as co-pilot; Stephen Barrinka, flight engineer; H. G. Rann, radio operator and Hector Nicholson, assistant radioman.

NEEDS ONLY RACKS

Rogers said the route will be via Winslow, Ariz.; Kansas City and Pittsburgh. He expects to land at Port Washington early Saturday.

Reports have been current for several weeks that England has been negotiating with Archbold and the

(Continued on Page 2-A, Col. 2)

Guba Will Leave Friday for East

(Continued from Page 1)

American Museum of Natural History for the purchase of the Guba. All that is necessary to convert the craft from a "flying laboratory" into a long-range bomber is to rip out sections of the wings and install bomb racks. This could be accomplished within a few days.

SET MANY RECORDS

The Guba was the first aircraft to fly around the world at its greatest diameter; made the longest overwater nonstop flight, from Dakar, Africa, to St. Thomas, Virgin islands; was the first to fly across the Indian ocean and the first flying boat to cross Africa. It left here in June, 1938, for New Guinea, and the following June sailed from Hollandia, New Guinea, for San Diego via Melbourne, Africa and the Virgin islands.

Rogers said Archbold, a research director of the American Museum of Natural History, has completed a six-month scientific expedition in Arizona and New Mexico. Two collections were obtained, one of a jack rabbit group from Ship Rock, N. M., and a ring tail cat collection from Arizona. Assisting Archbold on the expedition were A. L. Rand, ornithologist; William Richardson, mammalogist, and Prof. L. Brass, Australian botanist.

Archbold's "Guba" Begins Long Flight This Afternoon

July 5 '40
Prog. Journ.

● **Scheduled to** lift from San Diego bay at 2:30 p.m. today, the famed 'round-the-world air boat Guba will begin a non-stop flight to Port Washington, New York.

Reports have been current recently that the huge Consolidated-built craft will be purchased from its millionaire owner, Richard Archbold, by Great Britain for use in the Royal Air Force bombing fleet.

Used by Archbold as a "flying laboratory" on his numerous expeditions to far corners of the world for the American Museum of Natural History, all that would be necessary to convert the ship into a long-range bomber would be to rip out wing sections and install bomb racks. This would be a job of a few days only.

The Guba's crew today will be Russell Rogers, who has been at the controls in all its record-breaking flights to Africa and Netherlands, New Guinea; Douglas Kelley, veteran local flier, who will act as co-pilot; Stephen Barrinka, flight engineer; H. G. Rann, radio operator and Hector Nicholson, assistant radioman.

Rogers said the route will be via Winslow, Ariz.; Kansas City and Pittsburgh. He expects to land at Port Washington early Saturday.

The Guba was the first aircraft to fly around the world at its greatest diameter; made the longest overwater nonstop flight, from Dakar, Africa, to St. Thomas, Virgin islands; was the first to fly across the Indian ocean and the first flying boat to cross Africa. It left here in June, 1938, for New Guinea, and the following June sailed from Hollandia, New Guinea, for San Diego via Melbourne, [illegible] the Virgin islands.

DELAY ARCHBOLD FLIGHT

Postponement of the non-stop flight of Richard Archbold's flying boat Guba to Port Washington, Long Island, until Monday or Tuesday was announced today by Russell Rogers and Douglas Kelly, pilots. The flight originally was scheduled to begin Friday at 2:30 p.m. The postponement was due to Archbold's desire for additional equipment to be delivered by Consolidated Aircraft Corp., builder of the Guba. Trib.- 7-3

Consolidated Now Has Order Backlog Of $120,000,000

● Anticipating a backlog of orders which "probably will exceed $120,000,000" Consolidated Aircraft Corporation is rushing completion on a vast expansion program, Maj. Edgar N. Gott, Consolidated vice president, announced at a recent meeting of the San Diego Chamber of Commerce publicity committee.

Although the meeting theme centered around aircraft expansion in this area and plans for future development, Maj. Gott joined Maj. T. C. Macaulay, Chamber secretary-manager, in warning that "every step should be taken to rid this county of subversive elements seeking to retard national preparedness and to undermine this nation's democracy."

"The expansion program now being rushed to completion at Consolidated will, when completed, give San Diego the distinction of having the largest integrated covered and uncovered aircraft manufacturing plant in America," Maj. Gott declared. "Consolidated's manufacturing space, exclusive of field, ramp and railroad sidings, now occupies more than 1,910,000 square feet of area or a 87 per cent increase over the previous figure. With an option on adjacent land equal to an added 50 per cent of this area, plans nearly are completed for its possible use."

Maj. Gott said that "this expansion brings the local plant into full step with the President's recently announced national defense program and helps to place San Diego in the forefront of the drive to produce the stated 50,000-plane output a year."

In accordance with the gov-

Consolidated Now Has Order Backlog Of $120,000,000

(Continued from page 1)

ernment's plans to accelerate aircraft production, Consolidated has just put into effect a six-day 48-hour weekly schedule in all manufacturing departments. The new schedule will step-up production 20 percent and will increase the payroll by 30 percent due to payment of time and a half over the normal 40-hour week schedule.

Touching on Consolidated's present volume of business, Maj. Gott stated the plant already is operating "with a backlog in excess of $70,000,000 and contracts for additional work are being negotiated which, if accepted, will build this huge backlog to well over $120,000,000."

"Roughly, one half of this sum will be expended locally, and this largely through wages to employees, exerting a marked stimulus to local business of a purely beneficial nature, since the plant's operations do not draw upon the community's wealth, other than its climate. A distinct climatic advantage is the fact that approximately 30 per cent of the manufacturing operations can be conducted out of doors, thus paying health dividends to the employees as well as convenience to the company," he explained.

Thoroughly modern in construction and planning, Consolidated's huge plant utilizes all the latest features of aircraft plant design.

Rounding out its complement of equipment, some of the finest machine tools available in the market today have, and will be installed as the program progresses. Lathes, automatic screw machines, shapers, millers, die sinkers, planers, punchpresses, hydraulic presses, drop hammers, power shears and brakes and smaller electric and pneumatic tools in almost unlimited number are included. These machines are being operated by men rapidly learning the newest time saving features of this splendid equipment.

At the present moment, approximately 750 of the more than 7,500 skilled aircraftsmen are engaged in tool design and production, and the making of patterns which supplement the machine tools with special equipment; providing jigs, patterns and templates, assembly fixtures and the multitude of special tools required to assist the workmen to produce the finest airplanes possible.

In the past 17 years Consolidated planes have been sold to Brazil, Siam, Peru, Argentina, Mexico, Cuba, Canada, Colombia, China, Portugal, Turkey, Rumania, England and France. The bulk of the present contracts are for long-range bombers for the U. S. Army and navy and for the British Royal air force.

"Consolidated's present position and outlook for the future, bids fair to exert a marked influence on the growth of San Diego county," Maj. Gott concluded.

MAKES LONG HOP

The new navy patrol bomber, the Consolidated XPB2Y-1, recently made a nonstop, roundtrip transcontinental flight. The plane has four engines of 1050 horsepower each.

Aircraft Worker Seriously Injured

7/11/40

A Consolidated Aircraft Corp. worker was injured critically last night and his wife was cut and bruised when their car and one driven by Maj. Gen. C. H. Lyman, 64, U.S.M.C. ret., collided on Rosecrans st. between Goldsmith and Freeman sts., police reported.

Police physicians said the victim, Gordon Grant, 22, received a fractured skull and cuts and bruises. Grant and his wife, Elizabeth, 17, who reside at 3878½ Van Dyke ave., were taken to the County hospital.

Richard Alley, crash car officer, said the accident occurred when Grant tried to pass Lyman's vehicle on the right side as Lyman started to turn into his driveway. The impact threw the Grant machine over the curb and into

Start 48-Hour Week At Consair Plant

7/6-40

Consolidated Aircraft Corp. today began a six-day, 48-hour work week in a move which increases factory production 20 percent and adds 30 percent to the pay of employes, it was reported at the plant. The factory heretofore has been on a five-day, 40-hour week.

Maj. Reuben H. Fleet, president, issued the following statement:

"Subject to satisfactory arrangements with customers and the union representing Consolidated hourly employes, the plant hereafter will work regularly on a six-day, 48-hour weekly schedule and pay time and one-half to all except executive employes after 40 hours work by each employe, or 32 hours in any week cut short by a union-company recognized legal holiday. This action speeds up the national defense program 20 percent and adds 30 percent to the employe pay envelope."

The Merchants' association has been requested to keep stores open one evening a week to facilitate employes shopping.

CONSAIR PLANE TO TAKE OFF ON NONSTOP HOP TODAY

On a nonstop flight across the continent to Port Washington, the famed flying boat Guba will take off from the harbor today. Airport attendants are casting adrift the heavy launching hawser for a test.

* * *

Guba Ready To Fly East

With favorable weather conditions prevailing over a large part of the transcontinental route, Richard Archbold's Consolidated-built flying boat Guba is scheduled to take off from the harbor at 2:30 p. m. today on a nonstop flight to Port Washington, Long Island.

The route will take the big plane via Winslow, Ariz., Kansas City, Indianapolis and Pittsburgh. The crew will comprise Russell Rogers and Douglas Kelley, pilots; Stephen Barrinka, flight engigneer; Hector Nicholson, assistant flight engineer and Harold Ramm, radio operator.

The Guba returned here at 10:30 a. m. yesterday following a two-hour flight from Huntington lake, 50 miles from Fresno in the high Sierras. The Guba left San Diego for the lake Saturday on a practice flight.

On the trip across the continent Barney Boyd, local radio amateur, plans to keep in constant radio communication with the Guba until it lands tomorrow morning at Port Washington.

Consair Plant Plans Complete

7/3/40

Announcement was made yesterday by Maj. Reuben H. Fleet, president, that Consolidated Aircraft Corp. has completed plans for increasing its manufacturing facilities in addition to the $2,000,000 construction program which will be completed Aug. 1. Maj. Fleet said:

"Consolidated Aircraft Corp.'s position relative to President Roosevelt's recently announced national defense program calling for a 50,000-plane output a year is one of timely alignment.

"Our present expansion program by which our factory is being doubled, was under way before the President's announcement. Completed, this expansion will give us 1,910,000 square feet of covered and uncovered manufacturing space making it, I believe, the largest integrated aircraft manufacturing plant in America.

"We have an option on additional adjacent land, equal to 50 percent of this area with plans completed for its possible improvement."

Employment at Consair attained a new all-time high yesterday with a total of 7145 workers. Additional employes are being hired at the rate of 75 daily with the peak of 10,000 set for Aug. 1.

Archbold Plane Delays Hop to N. Y.

7/3

The non-stop flight from San Diego to Port Washington, Long Island, of Richard Archbold's famed flying boat Guba, scheduled to start Friday, 2:30 p. m., has been postponed until Monday or Tuesday.

The delay was caused by Archbold's desire for additional equipment to be delivered by Consolidated Aircraft Corp., builder of the big airboat.

The Guba will be piloted by Russell Rogers and Douglas Kelley with Stephen Barrinka as flight engineer.

El nuevo bombardero Consolidated metálico, modelo 32, sujeto recientemente a duras pruebas en San Diego, Cal., en una de las pocas fotos que se ha permitido tomarle, haciendo su primer vuelo de prueba. Los cuatro motores son Pratt and Whitney de 14 cilindros, que desarrollan 1,200 c. f. cada uno, equipados con hélices Hamilton Hydromatic de velocidad constante y paso variable, de 12 pies de diámetro. El peso en bruto se calcula en 40,000 libras, su envergadura es de 110 pies y el largo del fuselaje de 64. Los demás datos, sus performances, etc., permanecen en secreto.

Guba's Hop Delayed On Archbold Orders

Although poised for a 2 p.m. take-off from San Diego for New York, Richard Archbold's flying boat Guba will not make the transcontinental flight today and tonight after all, it developed at noon when Archbold instructed Russell Rogers, pilot, by long-distance phone from New York to delay his departure 24 hours. The reason given by Archbold was that the navy, which is interested in the flight, is planning a reception for Rogers and his flight companions at Floyd Bennett airport.

Weather conditions for a flight across the continent were good today, but Dean Blake, meteorologist, said he would have to study tomorrow morning's weather map before issuing a statement on what weather could be expected tomorrow night. The plane, fueled and stocked with supplies for the flight, is to carry, besides Rogers, Douglas Kelley, copilot; Stephen Barrinka, flight engineer; Harold Ramm, radioman, and Hector Nicholson, radioman.

VOCATIONAL SCHOOL TRAINS AIRCRAFT FORCE AT RATE OF 100 SKILLED WORKERS A WEEK

1000 Students Are Attending Summer Classes

With 1000 students enrolled in day and night classes, the San Diego Vocational school's summer session is in full swing to make available to the local aircraft industry 100 trained workers a week.

Short unit courses in the day program have been approved as part of the national defense training program, Walter L. Thatcher, principal, said. Reimbursement for the full amount of instructional cost involved in this phase of the program will be made from state and federal funds.

The weekly enrollment in the school has been stepped up from 80 to 100. Within five or six weeks this will mean a constant supply of 100 workers a week, trained in the various phases of aircraft mechanics.

504 ENROLLED

Thatcher said there are eight classes in aircraft riveting, eight classes in aircraft sheet metal layout, two classes in aircraft welding and one class in machine shop, in the day course, with 504 youths enrolled.

In the last year 900 students have been turned out by the school and obtained immediate employment.

"It is possible for a boy who has started day school work to continue his training by attending our night classes," said Thatcher. "By doing this, he can complete a full course, ordinarily in a year, to attain skilled workman standing. At night school alone this naturally takes somewhat longer, about a year and a half."

In the night sessions there are classes in blueprint reading, aircraft drafting, mettallurgy, plaster pattern making, aircraft sheet metal, aircraft and commercial welding, tool and die design and machine shop. There are 500 enrolled in these classes.

FRED ANDERSON

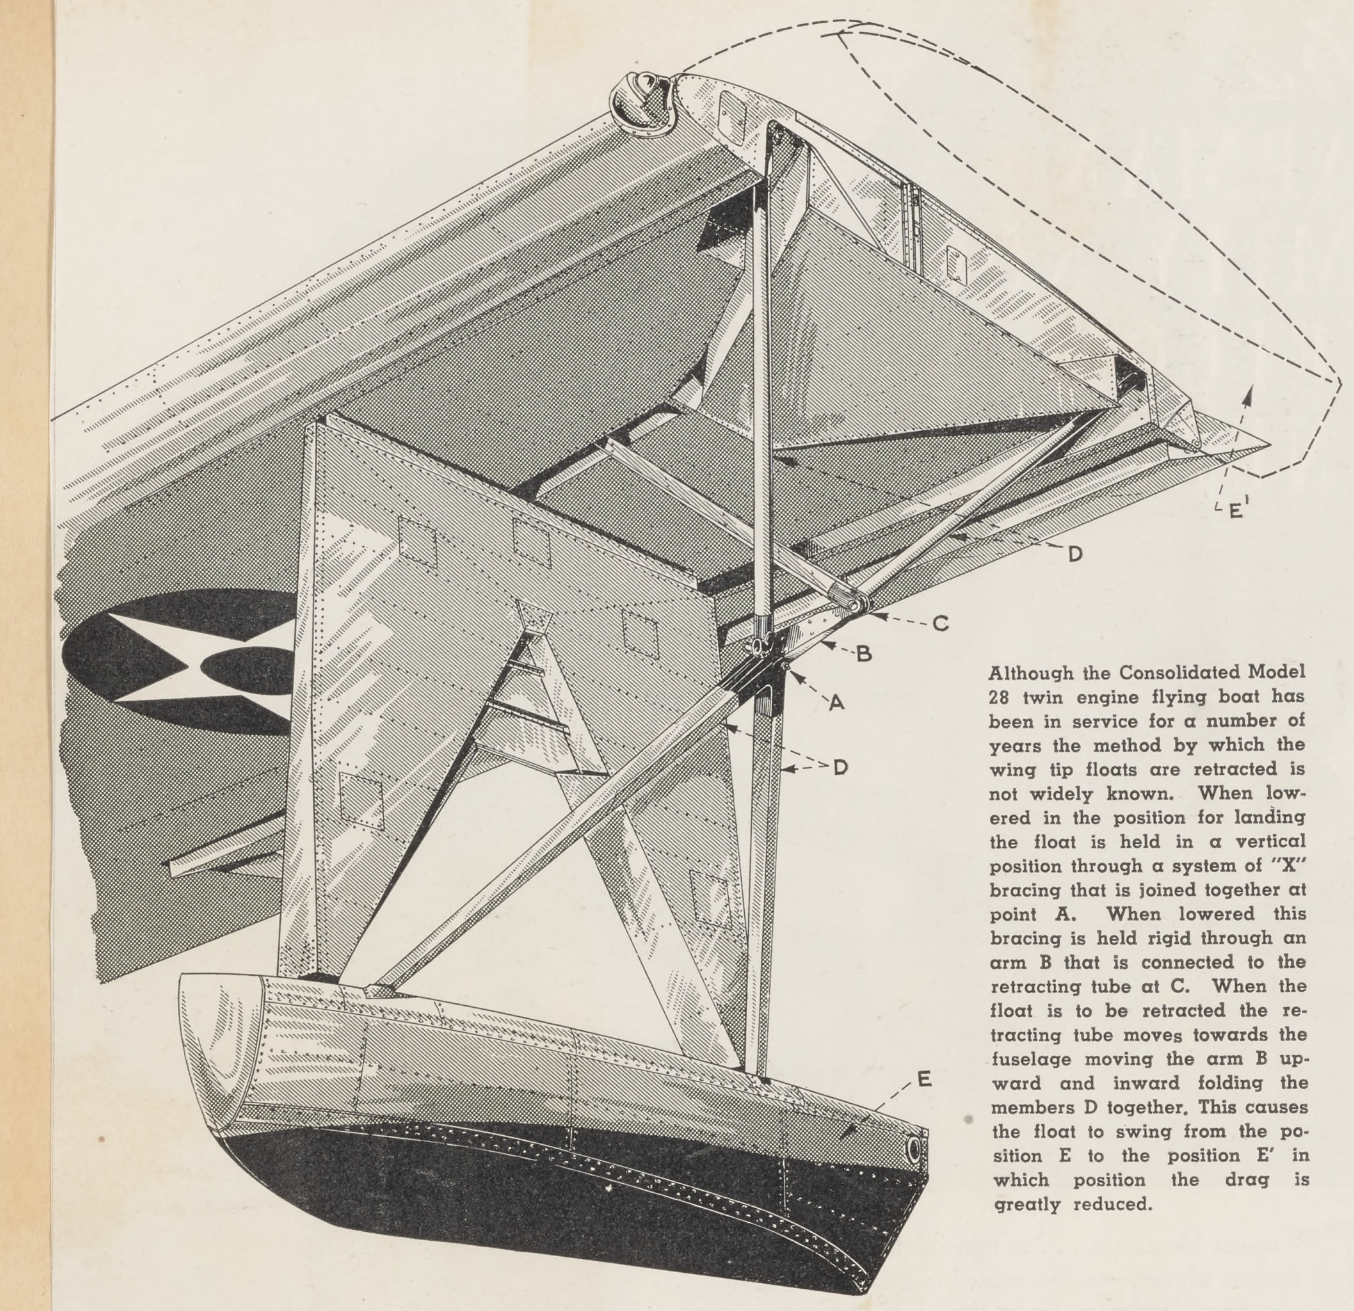
Four-motor Bomber Contract

A CONTRACT for the building of 120 Consolidated Model 32 four-motor bombers for the Armée de l'Air was secured by the Consolidated Aircraft Co. of San Diego, California. Delivery was scheduled to begin in the Summer of 1941.

The new four-motor Consolidated bomber is reputed to have a top speed of around 300 m.p.h. and a range of 3,000 miles. The loaded weight is 40,000 lb.

The big type of bomber would not have been our choice. For preference we would not put so many eggs in one basket, but if the big bomber is already in production the order may as well be transferred now to Great Britain. By the middle of next year we should have produced many machines for ourselves and the luxury of some big-scale models may be permissible.



Although the Consolidated Model 28 twin engine flying boat has been in service for a number of years the method by which the wing tip floats are retracted is not widely known. When lowered in the position for landing the float is held in a vertical position through a system of "X" bracing that is joined together at point A. When lowered this bracing is held rigid through an arm B that is connected to the retracting tube at C. When the float is to be retracted the retracting tube moves towards the fuselage moving the arm B upward and inward folding the members D together. This causes the float to swing from the position E to the position E' in which position the drag is greatly reduced.

Looking aft inside of the fuselage of the Model 28 shows the Zee stringers running lengthwise and the beltframes running crosswise. The large bulkheads in the rear are the 'banjo' bulkheads which extend on up into the fin structure. The tunnel door or hatch is shown on the keel while the two vertical tubes in the foreground are flare tubes.

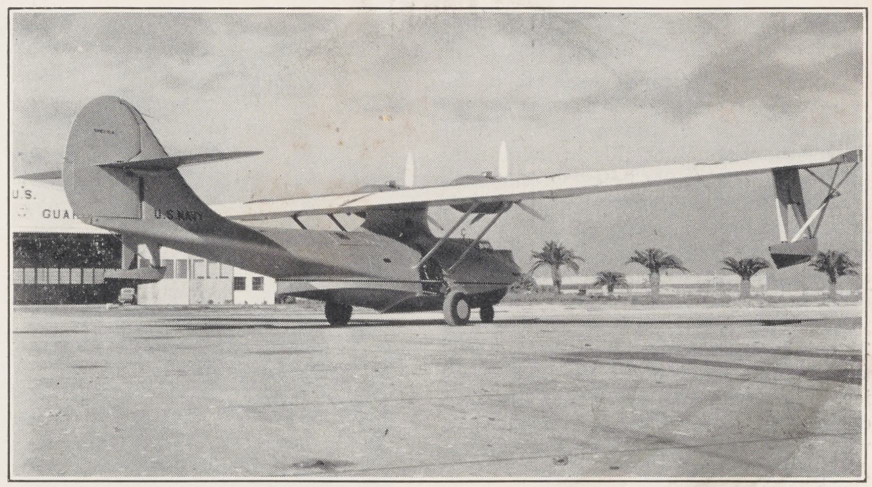
AERONAUTICS

AMPHIBIAN: *Land and Ocean Abilities Extend Ship's Range*



"*. . . opening wider fields of utility . . .*" Official U. S. Navy photo.

Equipped to rise from or alight on either land or water, Consolidated Aircraft Corporation's recent contribution to aeronautical progress, U. S. Navy plane XPBY-5A, is rated largest amphibian plane in the world.

The ship is a twin-engined flying boat to which has been added the amphibian feature, so that it can operate from land or sea, to land or water bases in remote localities, thus opening wider fields of utility.

Landing gear is tricycle type, single wheel forward and two aft, all fully retractable. Side wheel and supporting mechanism, complete with oleo shock struts, retract into wells in the side of the hull. Nose wheel in the bow is completely closed over in the retracted position by automatically operated hatches, so that no resistance to planing is encountered. All three wheels are operated by a central hydraulic power drive.

Flight testing with the gear in all positions and in combination with the retractable wing tip floats failed to disclose any adverse effects. Advantages of the landing gear, aside from greatly extending the scope of utility, are many: for rough water taxiing, the extended gear serves as a sea anchor, greatly assisting in control in open water, and in making an approach for mooring or ramp in an adverse wind. Also, more engine power may be applied for short turns without undue acceleration. Turns on the water are achieved with far less skidding and the danger of scraping the keel on the ramp is eliminated.

There is no need for a beaching crew, because the ship can climb a ramp or beach under its own power, descending in like manner, completely controlled by brakes. Side wheels are above water when the ship rises on the step, in making a take-off, and automatic means have been provided to eject all water in the closed bow-wheel hatch before the plane is in the air, so that flying trim is unaffected.

Contributing to smooth landings of the plane is its Goodyear multiple disc brake equipment.

$55,136,721 GAIN; CONSAIR BACKLOG NOW $96,870,000

Consolidated Aircraft Corp.'s backlog totals $96,870,000, representing an increase in business at the plant since Jan. 1 of $55,136,721, it was reported today. The figure, as of date June 30, the end of the second quarter of this year, was given in a notice to the stock exchange, it was said at the plant.

On May 13, when announcement was made of an order of approximately $20,000,000 for planes for the French and British governments, the Consolidated backlog rose to $70,000,000. A Consolidated spokesman said today that "no statement can be made" as to the nature of the increase of approximately $26,000,000 since May, and did not indicate whether it was for planes for the American government or foreign orders.

The stock exchange report stated that sales for the first six months this year, representing products delivered and billed, totaled $408,407. The operations during that period, it was reported, consisted primarily in making parts and sub-assemblies for planes which will be delivered commencing next month and continuing through 1941.

Guba's Non-Stop Flight Delayed Until Today

UNION July 10 - '40

The non-stop flight of Richard Archbold's flying boat Guba from San Diego to Port Washington, Long Island, scheduled to start at 2:30 p. m. yesterday, was postponed until 2 this afternoon on Archbold's request.

Telephoning from New York, Archbold said he desired the postponement because the navy, which is interested in the flight, is planning a reception for the Guba's crew at Floyd Bennett airport after the landing of the big plane at Port Washington.

Dean Blake, meteorologist here, said flight conditions yesterday were ideal but that he will have to consult the weather charts before giving Russell Rogers, the Guba's chief pilot, the go signal. The Guba has been fueled and provisioned for a 17-hour trip across the continent.

Flying with Rogers will be Douglas Kelley, co-pilot; Stephen Barrinka, flight engineer; Harold Ramm, radioman, and Hector Nicholson, assistant flight engineer.

Built by Consolidataed Aircraft Corp. for Archbold and the American Museum of Natural History, the Guba has made several record-breaking flights. It was employed 10 months in a scientific expedition in Netherlands New Guinea, later flew to Australia, thence across the Indian ocean to Africa and back to San Diego via the Virgin islands and New York.

Edgar N. Gott Marries

Edgar N. Gott, vice president, Consolidated Aircraft Corporation, San Diego, Calif., was married on May 2nd to Miss Madie Koenig, who was born in Omaha, Nebr. The ceremony took place at noon at the home of Colonel and Mrs. John H. Jouett, in Washington, D. C. About 30 persons attended, including Maj. Gen. H. H. Arnold, Chief of the Air Corps, who acted as best man.

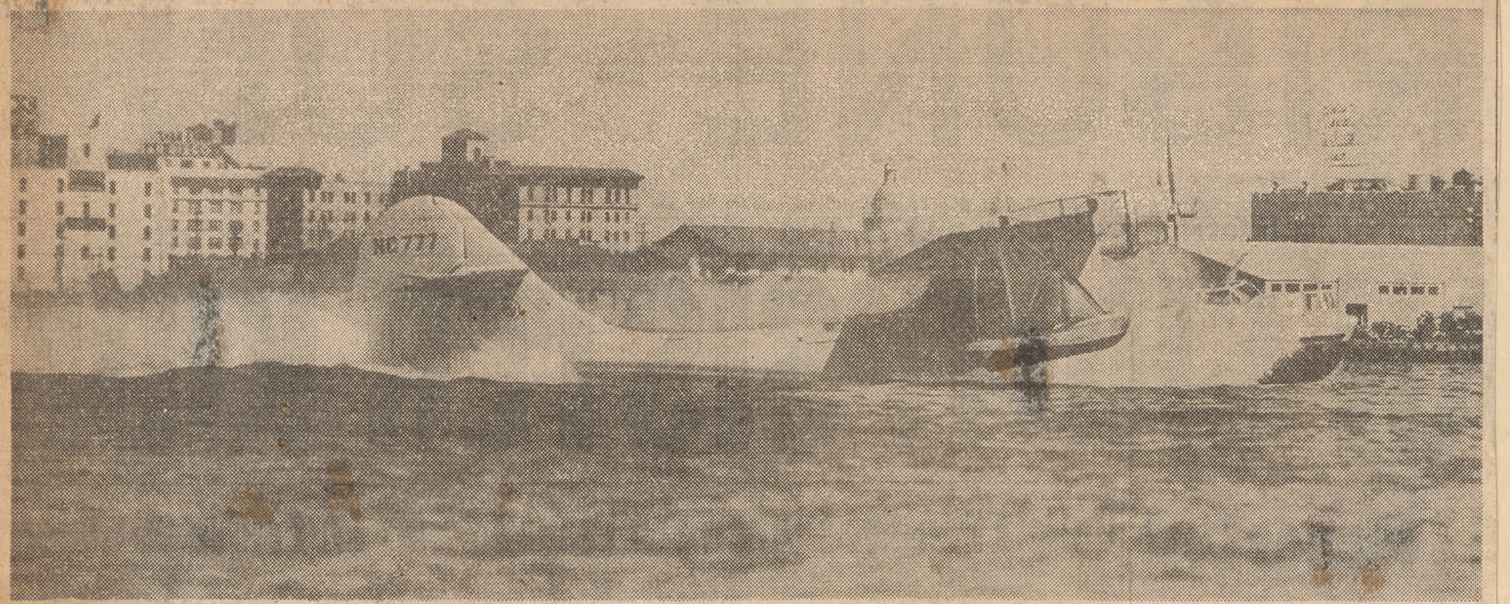
Consair Backlog Nears $100,000,000 Mark

Backlog of the Consolidated Aircraft Corp. totals $96,870,000 it was announced yesterday. This represents an increase since Jan. 1 of $55,136,721.

According to Maj. Reuben Fleet, president, additional contracts are expected to bring the backlog in excess of $100,000,000 within a few weeks.

THE TRIBUNE-SUN, San Diego, Calif., Thursday, July 11, 1940

Guba Spans Continent Nonstop in Less Than Sixteen Hours



The Guba, shown above, is taking off from San Diego bay yesterday afternoon, New York-bound.

FLIGHT IS CITED AS DEMONSTRATING SHIP'S MOBILITY

Completing a non-stop flight from San Diego in just under 16 hours, Richard Archbold's Consolidated-built flying boat Guba landed on Jamaica bay, New York, at 5:45 a.m., Pacific time, today. The plane left San Diego at 1:55 p.m. yesterday.

Navy officers were on hand at Floyd Bennett field to welcome Russell Rogers, chief pilot, and his flight companions, the International News Service reported. Archbold, who used the plane two years ago in scientific exploration in New Guinea, later flying on around the world by way of the Indian ocean, Africa and the Atlantic, was described as "enthusiastic about the plane's performance on its non-stop transcontinental flight."

Carries Mayor's Greetings

The Guba carried 1200 gallons of gasoline and greetings from Mayor P. J. Benbough were sent with Rogers to Mayor LaGuardia of New York. The flight route was via Winslow, Ariz., Kansas City and Pittsburgh.

Barney Boyd, local radio amateur, received a short-wave report at 11:40 p.m. yesterday that the plane had just passed Kansas City, flying at 8500 feet. The Guba is similar to the navy's PBY patrol bombers, but carries no armament.

Lt. Comdr. Donald F. Smith, head of the Floyd Bennett naval reserve base, said the flight was a "remarkable demonstration of the mobility and striking power of such ships," The United Press reported.

Rogers said the flight was uneventful. Archbold, who ordered the plane flown east, plans to store the Guba at Port Washington, Long Island. With Rogers were Douglas Kelley, co-pilot; Stephen Barrinka, flight engineer; Hector Nicholson, assistant engineer, and Harold Ramm, radioman.

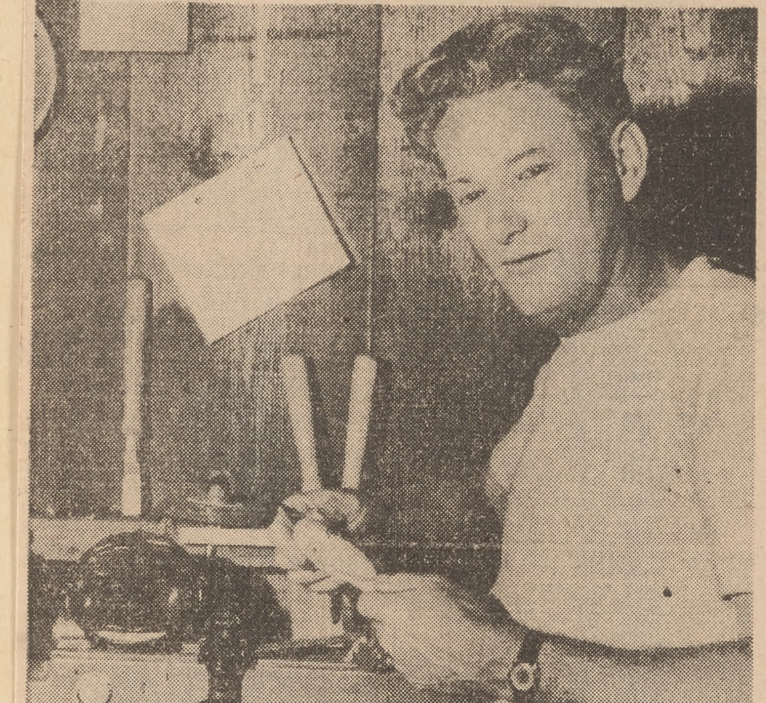
STARTED HOBBY ON BACK PORCH



LEWIS S. JONES

. . . whittled out a career for himself, with fun as a starter.

* * *

OCEAN BEACH MAN CARVES HIS WAY TO AIRCRAFT JOB

Starting as a back-porch whittler, Lewis S. Jones, Ocean Beach, once developed the hobby into a regular business, his products ranging from a scarf pin to a statute of a liver-lipped Ubangi maiden. He is still whittling, after a fashion, in the form department of the Consolidated Aircraft Corp. plant here.

Jones held classes at a hobby school and had more orders from department stores than he could fill once he got started in the business. This was not until after the proprietress of a gift shop next to the electric appliance company where Jones was a salesman saw a steer's head scarf pin he had carved for a colleague.

Jones now whittles on a much larger scale, helping to make the wood and metal forms around which the final metal parts of the big flying boats are built. He doubts that he will ever leave aircraft work to return to full-time wood carving.

Consolidated Now On 48-Hour Week

SAN DIEGO—Workers at Consolidated Aircraft Corp. Monday began a six-day, 48-hour week in a move which is expected to increase plant production 20 per cent and add 30 per cent to the pay of employees, factory officials reported.

The factory has been on a five-day, 40-hour week in the past.

UNION 7/11/40

Guba Leaves On Nonstop Flight to N. Y.

BULLETIN

"Just passed Kansas City at 11:40 p.m. (PST); flying at altitude of 8500 feet. Have covered 1330 miles; have 1110 miles to go; everything OK," was the message received from the Guba by Barney Boyd, following the flight by short-wave radio.

Loaded with 1200 gallons of gasoline, Richard H. Archbold's flying boat Guba took off from the harbor at 1:55 p.m. yesterday on a nonstop flight to Floyd Bennett field, New York.

Russell Rogers, chief pilot, said he expects to complete the 2440-mile flight in time to land at New York about 10:30 this morning.

AT 10,000 FEET

The flight route was via Winslow, Ariz., Kansas City, Indianapolis and Pittsburgh. Russell said he planned to fly at an altitude of 10,000 feet except when crossing over the Rocky mountains when the Guba will skim along the air lanes at 15,000 feet.

The plane carried greetings from Mayor P. J. Benbough to Mayor LaGuardia of New York.

Following a navy reception at the Floyd Bennett airport, the Guba is to be flown to Port Washington Long Island, where it will be stored pending a decision as to its future use by Archbold and the American Museum of Natural History, of which Archbold is an associate director.

AROUND WORLD

Since its construction by Consolidated the Guba has flown around the world and bears the distinction of being the first airboat to fly across the Indian ocean. Archbold used the craft for 10 months in a scientific expedition in Netherlands New Guinea, later flying it to Australia, Africa and the Virgin Islands.

In addition to Rogers the Guba's crew on the transcontinentau hop were Douglas Kelley, co-pilot; Stephen Barrinka, flight engineer; Hector Nicholson, assistant engineer, and Harold Ramm, radioman.

Scottish Daily Mail 6/15/40

FOR SALE: 1 FLYING-BOAT

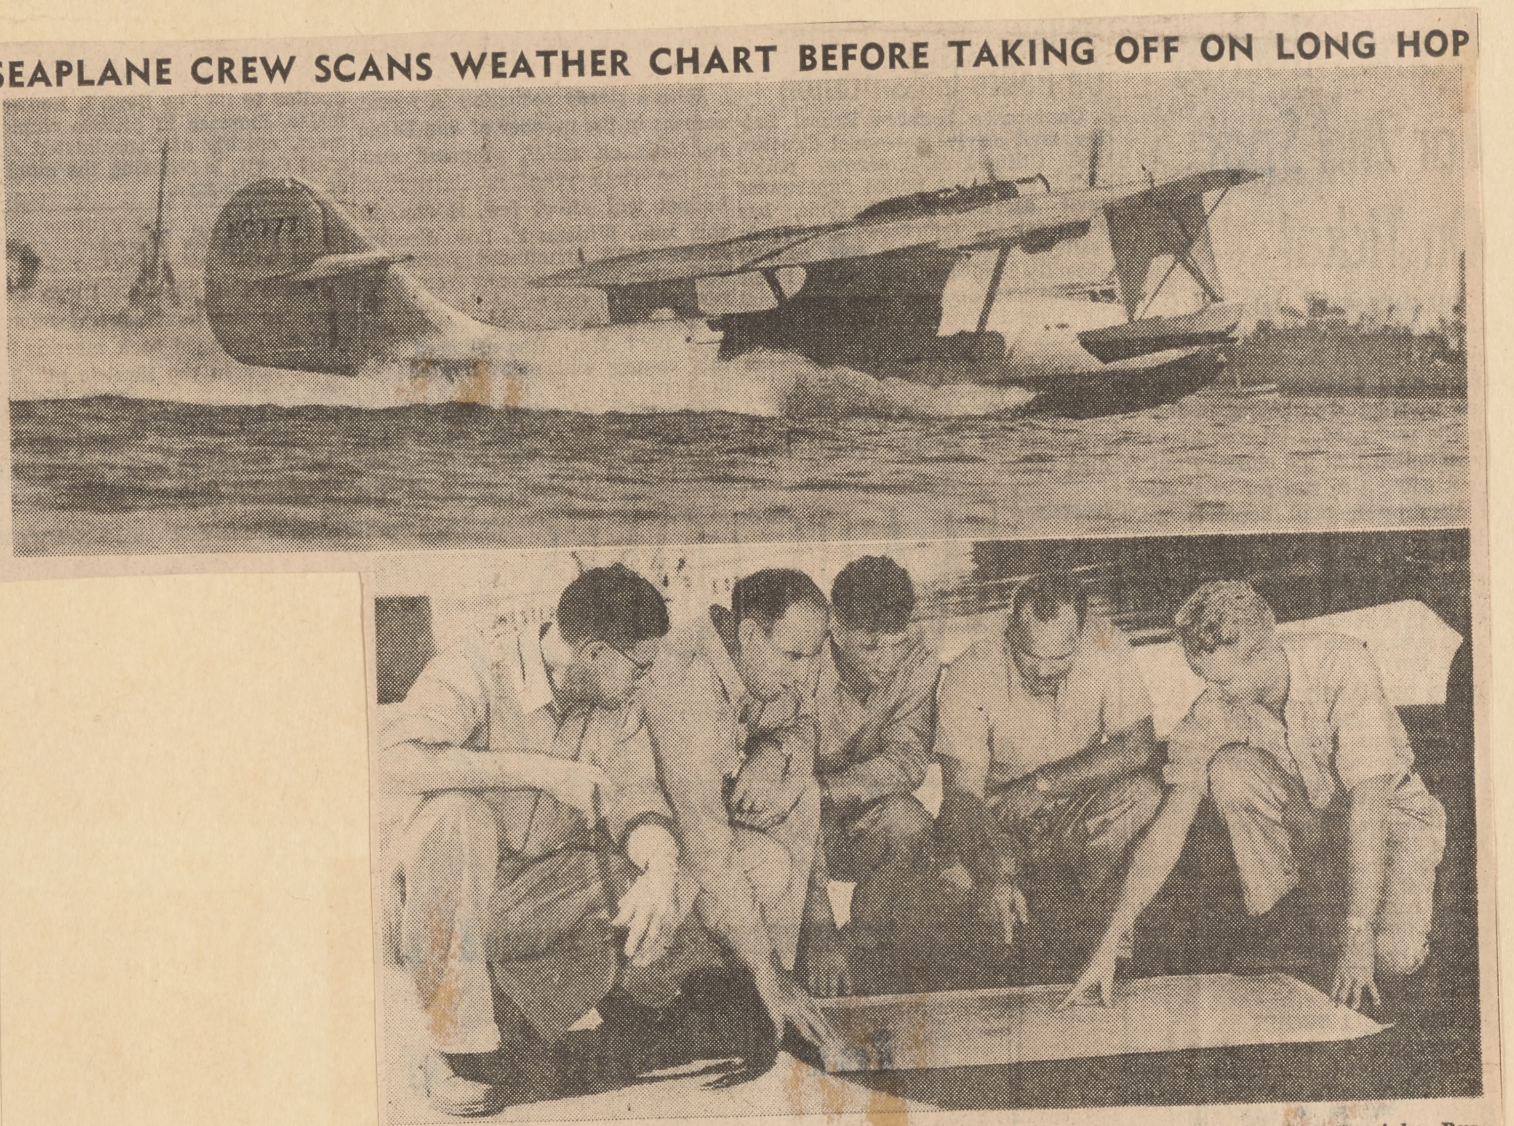
ANYONE wanting a private flying-boat?

A famous American craft —the Consolidated P.B. Y.2 "Guba"—which was making headlines a year ago with a series of remarkable flights across British territories overseas, is advertised for sale as a bargain in a leading American aviation magazine.

It has a reputed range of 4,000 miles, a speed of nearly 200 miles an hour, a host of gadgets including automatic pilot homing devices, direction finders—and two spare engines.

"Guba" made the first coast-to-coast crossing of the Indian Ocean from India to British East Africa. It has also crossed the Atlantic and Pacific Oceans and the continents of Australia and Africa.

SEAPLANE CREW SCANS WEATHER CHART BEFORE TAKING OFF ON LONG HOP



The crew of the seaplane Guba scanned the weather chart before taking off yesterday on a nonstop flight to New York. Left to right: Hector Nicholson, Douglas Kelley, Stephen Barrinka, Russell Rogers and Harold Ramm. The Guba, carrying 1200 gallons of gasoline, will fly at 10,000 feet.

Aircraft Contract Gives Hint of First Move to Inland Areas

Consolidated at San Diego May Reach Agreement for Placing Orders With New Factory at Dallas

LA Times 7/5/40.

SAN DIEGO, July 4.—First indication that any West Coast airplane plant has instigated steps to transfer even a portion of its operations inland appeared today in a confirmed report that Consolidated Aircraft Corp. may subcontract business to the Hall-Aluminum Aircraft Corp. in the latter's forthcoming new factory near Dallas.

RUMORS DENIED

Although denying rumors that the San Diego concern itself plans to establish a branch in Texas, David G. Fleet, assistant to Maj. Reuben Fleet, president, said:

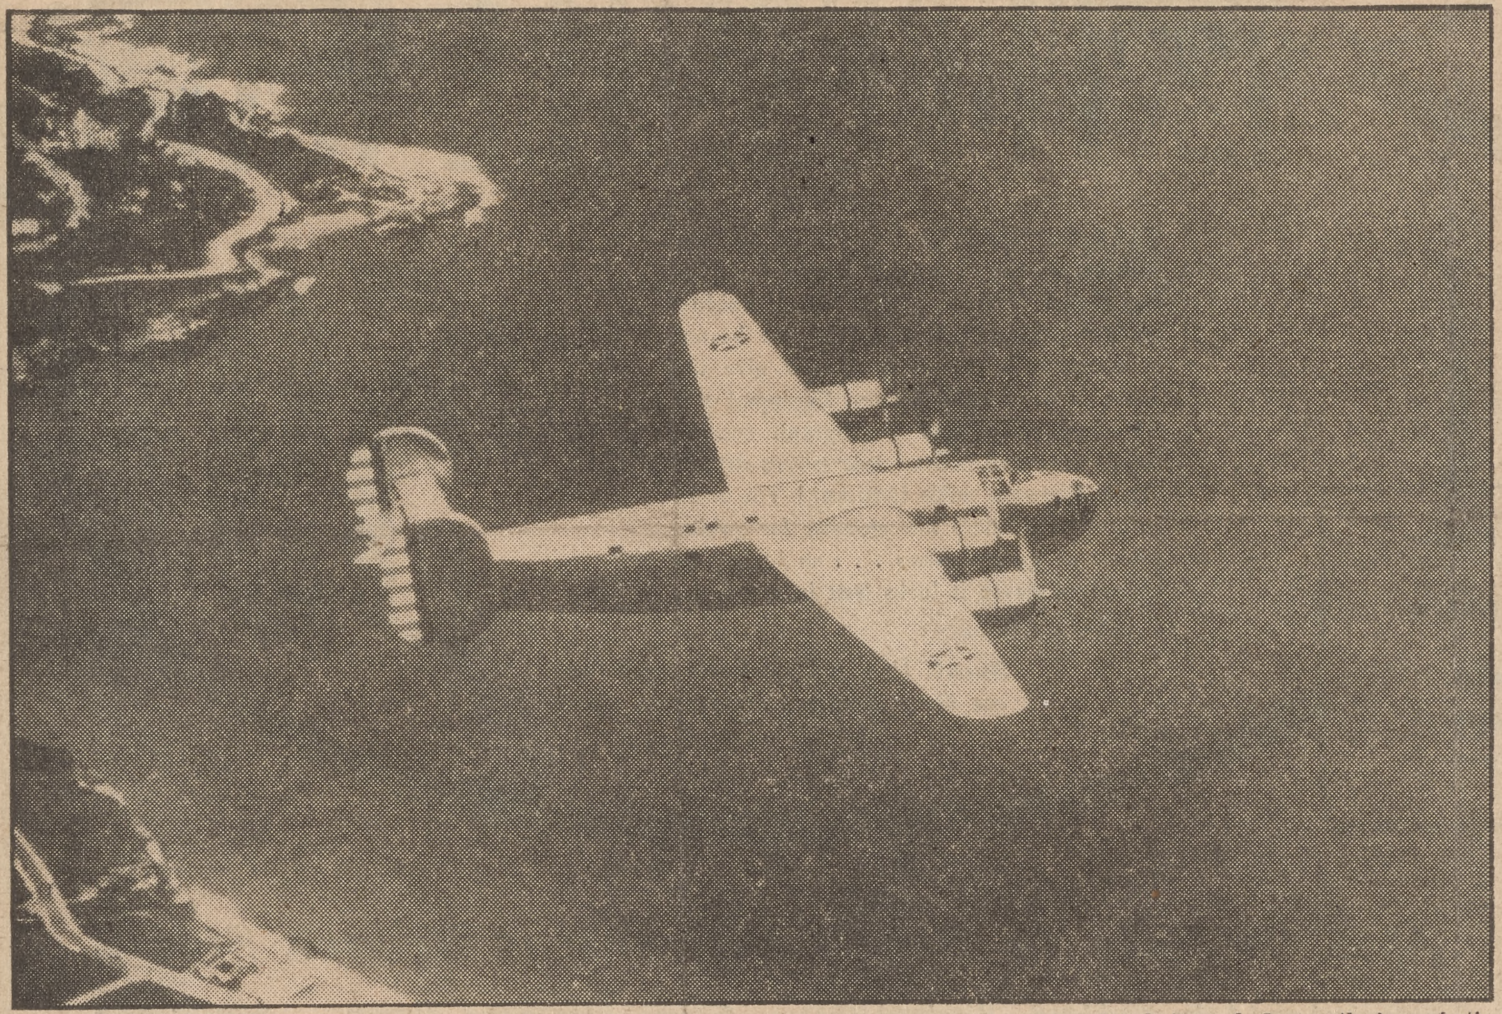
"Last month my father went east with Archibald Hall, president of the Hall company. En route, they stopped at Dallas to inspect a possible site for the Hall plant, since the latter's lease at Bristol, Pa., has expired. The Hall company is interested in establishing a new plant in the near future."

EXPERIENCE CITED

Fleet said the Hall concern, which is partially owned by the Aluminum Co. of America, builds Coast Guard seaplanes. Because of its experience, he indicated, it undoubtedly would receive consideration in placement of large Consolidated parts contracts—for tail structures and other fittings.

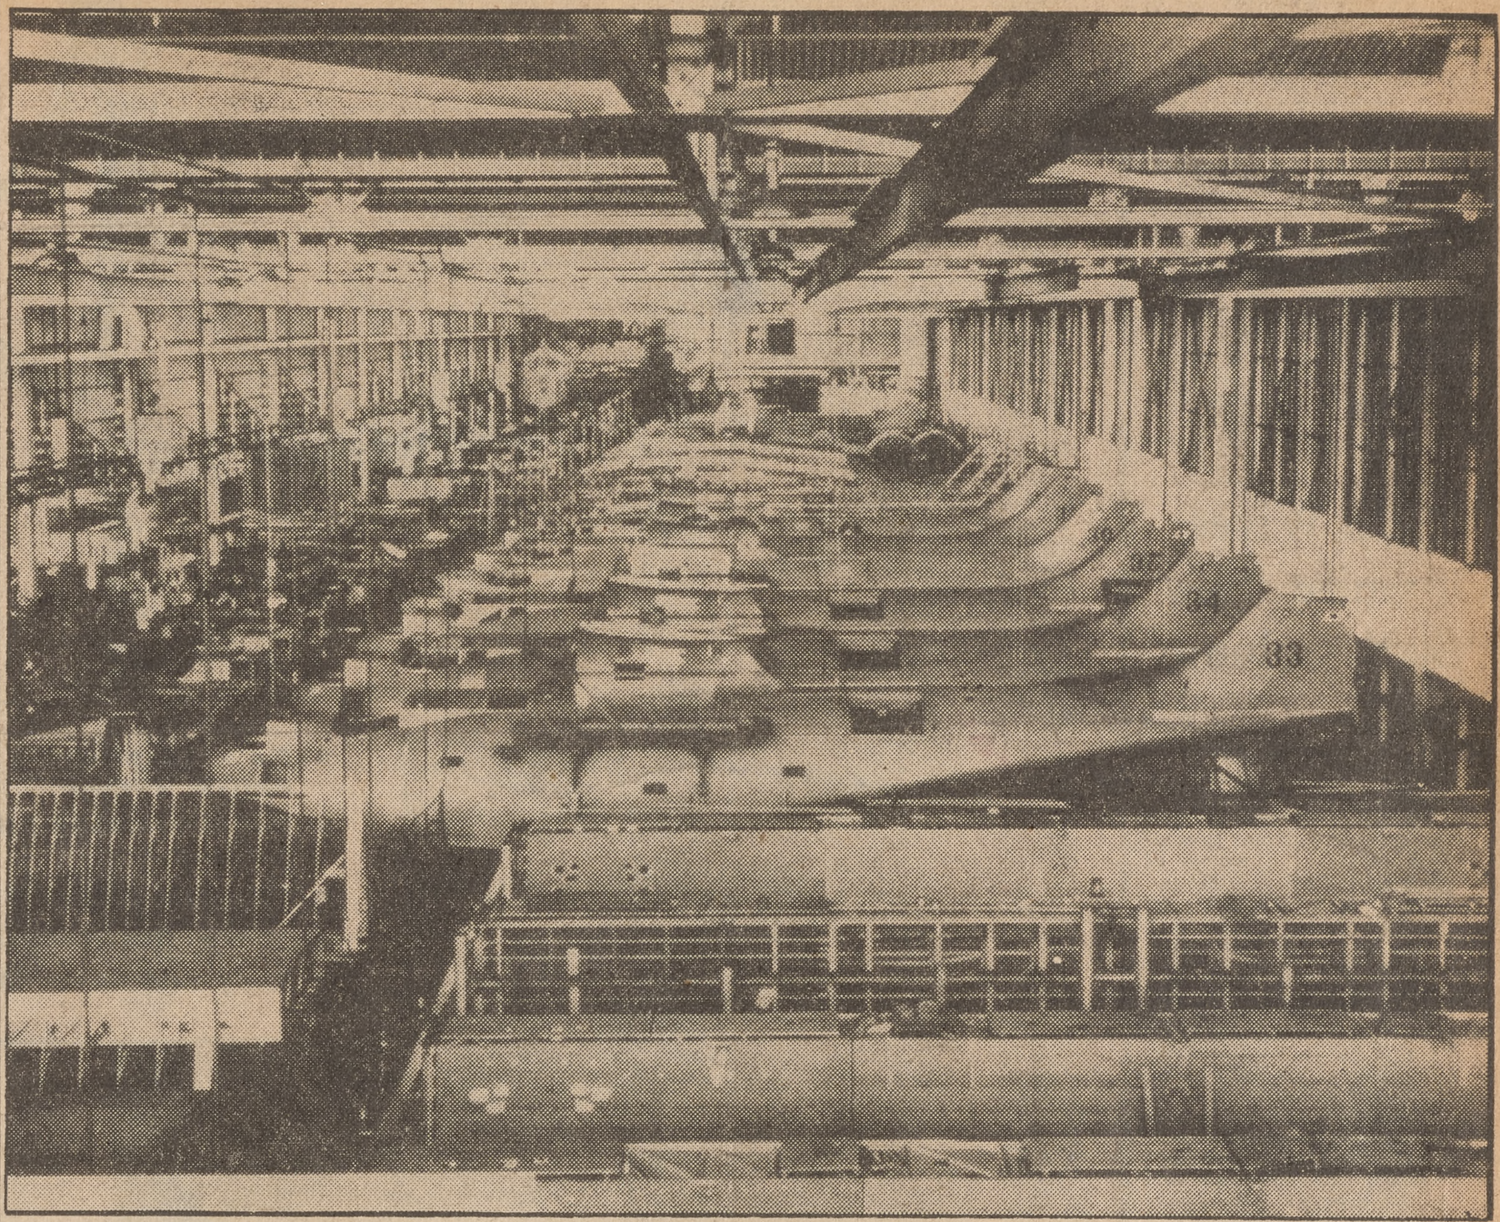
No plans have been made, Fleet added, for erection of a Consolidated branch factory inland, particularly since his company will complete a $2,000,000 expansion program next month, which will make it the largest integrated aircraft plant in America with almost 2,000,000 square feet of floor space.

UNCLE SAM'S NEW LONG-RANGE BOMBER



NEAR SAN DIEGO One of the United States Army Air Corps' new four-engined bombers was photographed recently in majestic flight over the Pacific Ocean. The giant craft, built by the Consolidated Aircraft Corporation, is known as the XB-24. She has a speed of more than 300 miles an hour, a range of approximately 3,000 miles and a bomb-carrying capacity of approximately four tons. Long-range flying is a primary consideration in building for Western Hemisphere defense.—Wirephoto.

SEA BIRDS FOR THE UNITED STATES NAVY



IN SAN DIEGO Flying boats constitute an important arm of aerial warfare, and American manufacturers are not neglecting this branch of aviation. Shown here is a long row of twin-engined flying boats in the hull-assembly line of the Consolidated Aircraft Corporation plant. Wing sections appear in the foreground. The Navy has in service more than 200 planes similar to these. Many flying boats are required as the Navy's Pacific defense area stretches from the Panama Canal to Hawaii to Alaska.—Wirephoto.

44 FIRMS ASSURE EMPLOYES AGAINST LOSS BY TRAINING

Forty-four San Diego business and industrial firms, representing thousands of employes, yesterday had pledged security to employes who engage in military training.

Signed assurances that jobs of men who enroll for military activity will not be jeopardized and that they will suffer no financial loss during training period are in the hands of Ewart Goodwin, special national guard civilian committee chairman.

Purpose of the campaign to enroll employers under the pledge, according to Goodwin, is to remove possibility of insecurity for the employes. Closing paragraph of the statement follows:

"It is our intention that these employes shall be spared the worry of insecurity in their jobs while they are training for a national emergency and while they are in the service of their country to protect the interests of the people of the United States."

The first firms signing the pledge include Alexander's, Aztec Brewing Co., Bank of America, Benson Lumber Co., Coca Cola Bottling Co., Consolidated Aircraft Corp., Consolidated Gas & Electric Co., Dixie Lumber Co., El Cortez Pontiac, First National Trust & Savings bank, Foster & Kleiser Co., Franklin Insurance Service Corp., Frost Hardwood Lumber Co., Gazosa Beverage Co., Glasson Mill & Lumber Co., Percy H. Goodwin Co., Mark Hanna Chrysler, Industries Supply Co., Kelley Linen Supply Co.

Increase Facilities At Consolidated Aircraft Corp.

● **Completion of plans** for increasing manufacturing facilities of Consolidated Aircraft Corp. has been announced by Maj. Reuben H. Fleet, president.

These increased facilities are in addition to the $2,000,000 construction program which will be completed Aug. 1, it was pointed out.

In the meantime, employment this week at Consolidated reached a high peak with more than 7000 workers busy. Additional employees are being hired at the rate of 75 daily. A total of 10,000 persons are scheduled to be working Aug. 1.

"Consolidated Aircraft Corp.'s position relative to President Roosevelt's recently announced national defense program calling for a 50,000-plane output a year is one of timely alignment," said Maj. Fleet.

"Our present expansion program by which our factory is being doubled, was under way before the President's announcement. Completed, this expansion will give us 1,910,000 square feet of covered and uncovered manufacturing space making it, I believe, the largest integrated aircraft manufacturing plant in America.

"We have an option on additional adjacent land, equal to 50 percent of this area with plans completed for its possible improvement," he concluded.

UNION - 7/16/40

Welders Hint Consair Strike

Possibility of a strike at Consolidated Aircraft Corp. here was reflected yesterday in the statement of James Goss, business agent of the United Aircraft Welders of America at Los Angeles, that the membership would be asked to strike unless the national labor relations board calls a bargaining election soon at Consolidated and at Lockheed and Vega aircraft plants at Los Angeles.

Goss said the labor board had refused to certify the welders' union as a bargaining agency because the American Federation of Labor machinists' union already had an agreement with the firms, The Associated Press reported.

The board has recognized that the welders union held a majority at the Ryan Aircraft Co., San Diego, and Douglas, North American and Vultee plants in Los Angeles, Goss said. A strike call would affect all seven factories, he added. The welders' union is affiliated with neither the A.F.L. nor the Congress of Industrial Organizations.

A Consolidated spokesman said the firm knew nothing of the matter and suggested it was a question between the labor board and the welder's group.

SWEDLOW AERO ISSUE ON MART

Public offering is being made today of 64,500 shares of 20-cent par value capital stock of Swedlow Teroplastics Corp. by a syndicate headed by Lester & Co. and including Cavanaugh, Morgan & Co.; Banks, Huntley & Co.; Page, Hubbard & Asche, and O'Melveny-Wagenseller & Durst. Offering price is $1.25 a share. Proceeds from the sale of this issue are to be ued for the purchase of additional machinery and equipment, for the increase of working capital and for other corporate purposes.

Officers and directors of the new company are as follows: Dave Swedlow, president and director; Lawrence Green, secretary, treasurer and director; Hall L. Hibbard, vice-president, director, and chief engineer of Lockheed Aircraft Corp.; Wolfgang Klemprer, engineer of Douglas Aircraft Co., Inc., director; Richard W. Millar, president of Vultee Aircraft, Inc., director, John K. Northrop, president of Northrop Aircraft, Inc., director; Charles H. Van Dusen, vice-president and works manager of Consolidated Aircraft Corp., director.

The company is engaged in the manufacture and sale of various articles fabricated from acrylic (methyl methacrylate) resins, which are plastics use, among other purposes, as a substitute for glass. The company fabricates and molds these plastics by a heating process into various forms and shapes for use in many industries, including the aviation industry.

Navy Type Seaplane Spans U. S. Non-Stop

The non-stop transcontinental flight of a huge flying boat, duplicate of the Navy's big PBY bombers, was completed at Floyd Bennett Field today in 15 hours, 49 minutes, opening official Navy eyes to the possibilities of transporting seaplanes over long routes in safety.

Navy officials were on hand as the plane, the Guba, owned by Richard Archbold, explorer, settled on Jamaica Bay at 9:45 a. m., after taking off from San Diego yesterday at 5:56 p. m., New York time.

Archbold, who used the ship in a round-the-world flight in 1938 in association with the American Museum of Natural History, was enthusiastic about the plane's performance on the non-stop journey across the nation.

Lieut. Comdr. Donald F. Smith, commanding the Naval Reserve base at Floyd Bennett, termed the flight "a remarkable demonstration of the mobility and potential striking power of the Navy's long range type bombers."

"It is proof that in an emergency large fleets of Navy bombers could be flown overnight from one coast to the other," he said.

Achbold, explaining that a third of its original gasoline supply of 1,700 gallons still remained in the tanks, added:

"We could have circled the field here and gone right on down to Florida without stopping."

A crew of five accompanied Archbold on the overnight hop from ocean to ocean.

Airplane Growth Zooms Skyward

Consolidated Air Craft Expansion Vividly Explained

EDITOR'S NOTE—This exclusive story, released for publication in the EXAMINER, gives readers a most comprehensive picture of the rapid expansion of this city's largest payroll, now concentrated in a defense preparation program second to none in the nation! More than 7,000 men are now employed at Consolidated.

The tremendous expansion program currently being rushed to completion at Consolidated Aircraft Corporation, which is already by far the largest local manufacturing enterprise, **will give San Diego the distinction of having the largest integrated covered and uncovered aircraft manufacturing plant in America.** Consolidated's manufacturing space, exclusive of field, ramp and railroad sidings, now occupies over 1,910,000 square feet of area or an 87 per cent increase over the previous figure, with an option on adjacent land equal to an added 50 percent of this area; plans are nearly completed for its possible use.

This expansion thus brings the local plant into full step with the President's recently announced national defense program, and helps to place San Diego in the forefront of the drive to produce the stated 50,000 plane output per year.

Already operating with a present backlog in excess of $70,000,000, contracts for additional work are being negotiated which, if accepted, will build this huge backlog for San Diego's concern to well over $100,000,000. **Roughly one half of this sum will be expended locally, and this largely through wages to employees, exerting a marked stimulus to local business of a purely beneficial nature, since the plant's operations do not draw upon the community's wealth, other than its climate.** A distinct climatic advantage is the fact that approximately 30 per cent of the manufacturing operations can be conducted out of doors, thus paying health dividends to the employees as well as convenience to the company.

LATEST EQUIPMENT

Thoroughly modern in construction and planning, Consolidated's huge plant utilizes all the latest features of aircraft plant design. The plant now extends for a half mile along Pacific Highway, and the new Final Assembly building at the north end of the plant is more than a city block in size with its tremendous roof held high in the air with remarkably few supporting columns. This construction allows exceptional manufacturing freedom within. A three story structure, the size of an average three story office building of the business district, is housed under the roof of this final assembly building, and a dozen more such structures could be placed under its roof without crowding.

Sawtooth roof construction affords north lighting during the daylight hours. Adequate artificial lighting is provided for the night workers. The plant is now operating three shifts. It is not difficult to appraise the fact that the entire plant is streamlined for the most efficient production and the greatest convenience to the workmen in all necessary facilities provided; for all its huge buildings, and **most of its equipment, are less than five years old today. This marks it as one of the newest and finest plants in all the world.**

Rounding out its complement of equipment, some of the finest machine tools available in the market today have, and will be installed as the program progresses. Lathes, automatic screw machines, shapers, millers, die sinkers, planers, punch-presses, hydraulic presses, drop hammers, power shears and brakes and smaller electric and pneumatic tools in almost unlimited number are included. These machines are being operated by men rapidly learning the newest time saving features of this splendid equipment.

At the present moment, **approximately 750 of the more than 7,000 skilled aircraftsmen are engaged in tool design and production,** and the making of patterns which supplement the machine tools with special equipment; providing jigs, patterns and templates, assembly fixtures and the multitude of special tools required to assist the workmen to produce the finest airplanes possible.

Consolidated's present position, and outlook for the future, bids fair to exert a marked influence on the growth of San Diego. Concluding a statement to the plant personnel on the recent advent of the Consolidated Aircraft Corporation's 17th birthday, President Major Reuben H. Fleet said, "We have a good organization—equal to any in our industry—the best in our history. So in counting our blessings let us consider that we have a factory of our own, tailored for our business, in the city of our choice, with plenty of work on hand and in sight, and no mortgage on our premises or our future. In one sense I regret that we are too busy to celebrate."

Ryan Aero Gets $800,000 Order

'Foreign Power' Buys Trainers

Closing of an $800,000 contract by Ryan Aeronautical Co. for production of military training planes for a "foreign power" was announced yesterday by T. Claude Ryan, president.

One of the largest individual contracts awarded to the firm, the order calls for manufacture and delivery of Ryan STM-2 military trainers, similar to those recently delivered to the U.S. army air corps. The country which ordered the trainers was not revealed, nor was the number of craft involved. The deal, however, was approved by the state department.

The contract covers land-plane trainers and a number of the same model equipped with twin floats as seaplane trainers. This is the first time the Ryan trainer has been offered as a seaplane. Production is under way, Ryan said, and the entire order is scheduled for delivery in the next few months.

Meanwhile, Consolidated Aircraft Corp. announced a backlog of orders totaling $96,870,000, an increase of $55,136,721 since Jan. 1. Additional orders are expected within a few weeks to bring the backlo to more than $100,000,000, accordi to Maj. Reuben Fleet, president.

OUR FLYING BOYS

A BLENHEIM'S LAST FIGHT

Limping home with one engine out of action and part of its tail shot away, while six Me.109 fighters attacked from behind, a British Blenheim fighter landed on a mudbank. Its crew were posted as "missing"; they are now safe.

They had been on a "strafing" expedition with others of their squadron to Rotterdam. They attacked enemy aircraft on Rotterdam aerodrome, blazed away at hangars, and then found six Me.109's on their tail as they came out of the dive.

The Blenheim's port engine, which had been smoking from an early shot, was destroyed by a shell from an enemy aircraft's cannon. Apart from the six enemy machines in pursuit, there were at least fifty German aircraft in the air at the time.

Things looked black for the Blenheim's crew with only the starboard engine working. As they turned for home, they swung from side to side and their speed fell to 130 m.p.h., making them virtually a "sitting bird" for the Messerschmitts.

"But, fortunately for us," said the Blenheim's air-gunner, "their shooting was bad. Only an occasional burst of machine-gun bullets entered the cockpit, though one of the shells fired at us broke up our tail and another took ten inches or so off the blade of the airscrew."

"If it hadn't been for the excellent guidance of the gunner," said the pilot, "we would not have escaped. He gave a first-rate running commentary over the radio telephone on the movements of the enemy, which helped me to adopt successful evasive tactics."

After nearly ten minutes, with the Blenheim's speed failing, the enemy decided to leave the British aircraft to the mercy of one Messerschmitt. Five flew off and the sixth came in to give the *coup de grace*. But the enemy pilot took things a little too easily. He attacked from close range and at last the British rear gun spoke (it had jammed earlier in the fight).

"I must have got him," said the air-gunner. "Instead of sweeping past he suddenly slowed down and gradually fell away towards the ground. I think I must have hit the pilot with my last few rounds."

The British crew were left alone for the next five or six minutes, hedge-hopping as they went on slowly, on one engine. Finally, the pilot decided his remaining engine was running so badly that it would be unsafe to go further. He landed on a mudbank, coming down on the mud about 50 yards from the shore of an estuary.

When they finally reached home, with the help of a British destroyer, the pilot and air-gunner found that they had been posted as "missing" and that telegrams had been sent to their families.

Reassuring telegrams, however, quickly followed.

* * *

TRUTH ABOUT THE TROOP-CARRIERS

Answering a question in the House of Commons recently Captain Balfour, Parliamentary Under-Secretary of State for Air, said that the German aircraft engaged on troop-carrying operations are generally of the unarmed transport class.

A member had asked for information about the nature and calibre of the armament, other than small arms, carried by German troop-carriers and similar aircraft which have been employed in the operations on the continent.

Replying, Captain Balfour said that in addition to the usual small arms, the troops carried are known to have been equipped with heavy machine-guns of 13 and 20 millimetres calibre; with 5 centimetre and 8.1 centimetre mortars; with 7.5 centimetre infantry guns and possibly 10.5 centimetre light howitzers.

The most widely used German troop-carrier is the 3-engined Junkers 52, which is capable of carrying about fourteen troops, has a maximum speed of 190 m.p.h. and a range of 1,000 miles. The more modern Ju.90 carries nearly three times as many troops and has a top speed of 225 m.p.h.

LOCKHEED HUDSON STILL MAKING GOOD

Among the first American-built aircraft to go into action with the Allied Air Forces is a military version of a famous U.S.A. civil air-liner, the Lockheed 14. In its specially equipped form as a fast reconnaissance aircraft it is known as the "Hudson."

It was the first aircraft to cross the Atlantic on the deck of a modern liner. Several hundreds of the type were ordered before the war, and a considerable number are now in service with the R.A.F.

It is an all-metal mid-wing monoplane with two Wright Cyclone radial motors giving a total power output of about 2,000 h.p. The fuselage is the cabin type with accommodation for a crew of four, and there is a gun turret aft in addition to forward firing armament. In its commercial form, with less powerful engines, it had a speed of about 260 m.p.h.

Though fast and manœuvreable the Hudson is primarily a scouting rather than fighting machine. Nevertheless, in the hands of R.A.F. pilots of the Coastal Command the Hudson has earned a great fighting reputation in a number of actions.

Many of these fights have about them more than a touch of audacity. In the first months of the war a single Hudson took on two big German Dornier flying-boats, holding them in close battle until two other British aircraft came up and helped to defeat the Germans. Another engagement over Bergen fjord ended with a Dornier being shot down; and in a fight between a Hudson and a Dornier over the North Sea the Hudson settled its adversary in 35 seconds. It was also a Hudson aircraft of Coastal Command which first spotted the ill-famed Altmark off the coast of Norway.

A recent exploit of the Hudsons was an attack by three of them last week on a formation of forty enemy planes, including protective fighters, which were attempting to bomb a British troopship. Three Ju.87 dive bombers were destroyed, two more driven down and the formation broken up, whilst the Hudsons were untouched.

The tale of successes of this trans-Atlantic aircraft, under all sorts of conditions of weather and war, is a good augury for the performance of the newer and more powerful American types now coming into service with the Allies.

AIR FORCE NEWS IN BRIEF

The number of awards for outstanding bravery, skill and daring made to officers, N.C.O.'s and men of the Air Force since the beginning of the war affords ample evidence of the devotion of all ranks alike. Up to the end of May 10 D.S.O.'s, one bar to a D.S.O., 139 Distinguished Flying Crosses and three bars to the D.F.C. had been awarded to officers. During the same period 41 Distinguished Flying Medals and two bars to the D.F.M. were awarded to Sergeants and Flight Sergeants and 46 Distinguished Flying Medals to Corporals and others below that rank.

* * *

TAILPIECE

A famous American flying-boat—the Consolidated P.B.Y.2 "Guba"—which was making headlines a year ago with a series of remarkable flights across British territories overseas, is in the news again. It is advertised for sale as a bargain in "Aviation's Market-place" in a leading American aviation magazine.

This seems to be a chance for anyone wanting their own private flying-boat, with a reputed range of 4,000 miles, a speed of nearly two hundred miles an hour, a host of gadgets including automatic pilot homing devices, direction finders—and two spare engines!

"Guba" made the first coast-to-coast crossing of the Indian Ocean from India to British East Africa. Its round trip included also crossings of the Atlantic and Pacific Oceans, and the continents of Australia and Africa.

Following flights of famous British aircraft, such as the world record flight of Vickers "Wellesleys" from Egypt to Australia, and of the Short "Empire" flying boats on the Empire Air Mail services, "Guba's" flight demonstrated some of the possibilities of the modern long-range aircraft in linking up the distant parts of the British Commonwealth.

Army Bomber Nears Completion

Workmen finishing construction of an army XB-24 bomber on the final outdoor assembly line at Consolidated Aircraft Corp. in San Diego. The plane marks the re-entry into the land plane field by the Consolidated Company, which is now the largest manufacturer of flying boats in the world. Several of these huge bombers are now on the final assembly line. They are powered with four engines rated at 1200 H. P. each. Wide World Photo.

Wings of the Navy

Long-Range Patrol 'Air Battleships' in Commission

By **HAROLD KEEN**

Released by
North American Newspaper Alliance, Inc.

SAN DIEGO, July 15—The U. S. navy's scouting eyes have acquired "binoculars" that will project the fleet's vision to the most distant theaters of possible sea combat.

This is the isgnificant fact behind the commissioning this month of a new aviation unit, Patrol Squadron 13, at the naval air station here.

It is the first to contain the navy's most recently developed long-range heavy bombing seaplanes, four-motored (1050 h. p. each), 25-ton giants capable of a speed in excess of 200 miles an hour and a nonstop range of 5000 miles.

Their range, with a great load of bombs or aerial torpedoes, will give the fleet a reconaissance scope of 2500 miles from any shore base or refueling vessels at sea, and a terrific striking power to harass or even cripple an approaching hostile force.

The new bombers, built at Consolidated Aircraft Corporation, San Diego, will enable a complete blanketing of such gateways to vital American positions as the Caribbean, the Pacific approaches to Hawaii, Alaska and the Aleutian islands, and the zones in the Far East surrounding the U. S. naval base at Cavite, Philippine islands.

They will extend the present area of scouting operations 1000 round-trip miles beyond that made possible by the navy's present armada of 250 twin-engined PBY-type patrol bombers, based at Pearl harbor, Hawaii; Sitka, Alaska; Cavite, P. I.; Seattle, San Diego, Norfolk and Coco Solo, Canal zone.

The prototype of these veritable battleships of the air, secretly engineered and built over a period of more than three years, was perhaps the most expensive seaplane ever constructed in the United States. Its cost was $1,000,000, with the navy contributing $400,000. This first of the series of recently completed 4-motored bombers startled the world of military aviation October 28, 1938, when it was flown nonstop, while still in an experimental stage, across the continent from San Diego to Anacostia, D. C.—over stretches of land where a forced landing for a seaplane would have been disastrous—in 13 hours, 55 minutes.

Because of its great speed and passeng!er carrying capacity, it has unequaled value as an overwater—or even overland—transport to effect rapid troop transfers. On long, overnight flights the plane can carry 30 passengers and, six crew members, while on shorter jaunts there would be space enough for 50.

Patrol squadron 13 will bear the distinction of containing the most heavily armed aircraft in the navy service, the exact caliber of their guns being a military secret.

BRITAIN'S U.S. PLANE BILL—£250,000,000

THE New York Times yesterday printed the following article:—

For the first time since France and Britain placed orders for American airplanes, a detailed and fairly complete picture of the number of types of airplanes purchased can now be made public.

Until now the purchases have been expressed in dollar values, leaving the number of units to guesswork.

By assuming the French contracts, Britain now holds contracts for 9512 American airplanes, estimated at a cost of more than £250,000,000. Nearly half that number have been delivered—that is, turned over to Allied agents here. How many have been shipped to Europe cannot be definitely learned, but the latest estimate is about 3,000.

British orders in the 10 months of the war were made up as follows:—Douglas bombers, 360; North American trainers, 1165; Lockheed bombers, 1550; Bell Aircobras, 240; Brewster fighters, 150; Consolidated flying-boats, 40.

The arrival in New York this week of Harold F. James of the British Ministry of Aircraft Production is interpreted as meaning that the British plan to place further orders.

OUR FLYING BOYS

A BLENHEIM'S LAST FIGHT

Limping home with one engine out of action and part of its tail shot away, while six Me.109 fighters attacked from behind, a British Blenheim fighter landed on a mudbank. Its crew were posted as "missing"; they are now safe.

They had been on a "strafing" expedition with others of their squadron to Rotterdam. They attacked enemy aircraft on Rotterdam aerodrome, blazed away at hangars, and then found six Me.109's on their tail as they came out of the dive.

The Blenheim's port engine, which had been smoking from an early shot, was destroyed by a shell from an enemy aircraft's cannon. Apart from the six enemy machines in pursuit, there were at least fifty German aircraft in the air at the time.

Things looked black for the Blenheim's crew with only the starboard engine working. As they turned for home, they swung from side to side and their speed fell to 130 m.p.h., making them virtually a "sitting bird" for the Messerschmitts.

"But, fortunately for us," said the Blenheim's air-gunner, "their shooting was bad. Only an occasional burst of machine-gun bullets entered the cockpit, though one of the shells fired at us broke up our tail and another took ten inches or so off the blade of the airscrew."

"If it hadn't been for the excellent guidance of the gunner," said the pilot, "we would not have escaped. He gave a first-rate running commentary over the radio telephone on the movements of the enemy, which helped me to adopt successful evasive tactics."

After nearly ten minutes, with the Blenheim's speed failing, the enemy decided to leave the British aircraft to the mercy of one Messerschmitt. Five flew off and the sixth came in to give the *coup de grace*. But the enemy pilot took things a little too easily. He attacked from close range and at last the British rear gun spoke (it had jammed earlier in the fight).

"I must have got him," said the air-gunner. "Instead of sweeping past he suddenly slowed down and gradually fell away towards the ground. I think I must have hit the pilot with my last few rounds."

The British crew were left alone for the next five or six minutes, hedge-hopping as they went on slowly, on one engine. Finally, the pilot decided his remaining engine was running so badly that it would be unsafe to go further. He landed on a mudbank, coming down on the mud about 50 yards from the shore of an estuary.

When they finally reached home, with the help of a British destroyer, the pilot and air-gunner found that they had been posted as "missing" and that telegrams had been sent to their families.

Reassuring telegrams, however, quickly followed.

* * *

TRUTH ABOUT THE TROOP-CARRIERS

Answering a question in the House of Commons recently Captain Balfour, Parliamentary Under-Secretary of State for Air, said that the German aircraft engaged on troop-carrying operations are generally of the unarmed transport class.

A member had asked for information about the nature and calibre of the armament, other than small arms, carried by German troop-carriers and similar aircraft which have been employed in the operations on the continent.

Replying, Captain Balfour said that in addition to the usual small arms, the troops carried are known to have been equipped with heavy machine-guns of 13 and 20 millimetres calibre; with 5 centimetre and 8.1 centimetre mortars; with 7.5 centimetre infantry guns and possibly 10.5 centimetre light howitzers.

The most widely used German troop-carrier is the 3-engined Junkers 52, which is capable of carrying about fourteen troops, has a maximum speed of 190 m.p.h. and a range of 1,000 miles. The more modern Ju.90 carries nearly three times as many troops and has a top speed of 225 m.p.h.

LOCKHEED HUDSON STILL MAKING GOOD

Among the first American-built aircraft to go into action with the Allied Air Forces is a military version of a famous U.S.A. civil air-liner, the Lockheed 14. In its specially equipped form as a fast reconnaissance aircraft it is known as the "Hudson."

It was the first aircraft to cross the Atlantic on the deck of a modern liner. Several hundreds of the type were ordered before the war, and a considerable number are now in service with the R.A.F.

It is an all-metal mid-wing monoplane with two Wright Cyclone radial motors giving a total power output of about 2,000 h.p. The fuselage is the cabin type with accommodation for a crew of four, and there is a gun turret aft in addition to forward firing armament. In its commercial form, with less powerful engines, it had a speed of about 260 m.p.h.

Though fast and manœuvreable the Hudson is primarily a scouting rather than fighting machine. Nevertheless, in the hands of R.A.F. pilots of the Coastal Command the Hudson has earned a great fighting reputation in a number of actions.

Many of these fights have about them more than a touch of audacity. In the first months of the war a single Hudson took on two big German Dornier flying-boats, holding them in close battle until two other British aircraft came up and helped to defeat the Germans. Another engagement over Bergen fjord ended with a Dornier being shot down; and in a fight between a Hudson and a Dornier over the North Sea the Hudson settled its adversary in 35 seconds. It was also a Hudson aircraft of Coastal Command which first spotted the ill-famed Altmark off the coast of Norway.

A recent exploit of the Hudsons was an attack by three of them last week on a formation of forty enemy planes, including protective fighters, which were attempting to bomb a British troopship. Three Ju.87 dive bombers were destroyed, two more driven down and the formation broken up, whilst the Hudsons were untouched.

The tale of successes of this trans-Atlantic aircraft, under all sorts of conditions of weather and war, is a good augury for the performance of the newer and more powerful American types now coming into service with the Allies.

AIR FORCE NEWS IN BRIEF

The number of awards for outstanding bravery, skill and daring made to officers, N.C.O.'s and men of the Air Force since the beginning of the war affords ample evidence of the devotion of all ranks alike. Up to the end of May 10 D.S.O.'s, one bar to a D.S.O., 139 Distinguished Flying Crosses and three bars to the D.F.C. had been awarded to officers. During the same period 41 Distinguished Flying Medals and two bars to the D.F.M. were awarded to Sergeants and Flight Sergeants and 46 Distinguished Flying Medals to Corporals and others below that rank.

TAILPIECE

A famous American flying-boat—the Consolidated P.B.Y.2 "Guba"—which was making headlines a year ago with a series of remarkable flights across British territories overseas, is in the news again. It is advertised for sale as a bargain in "Aviation's Market-place" in a leading American aviation magazine.

This seems to be a chance for anyone wanting their own private flying-boat, with a reputed range of 4,000 miles, a speed of nearly two hundred miles an hour, a host of gadgets including automatic pilot homing devices, direction finders—and two spare engines!

"Guba" made the first coast-to-coast crossing of the Indian Ocean from India to British East Africa. Its round trip included also crossings of the Atlantic and Pacific Oceans, and the continents of Australia and Africa.

Following flights of famous British aircraft, such as the world record flight of Vickers "Wellesleys" from Egypt to Australia, and of the Short "Empire" flying boats on the Empire Air Mail services, "Guba's" flight demonstrated some of the possibilities of the modern long-range aircraft in linking up the distant parts of the British Commonwealth.

Army Bomber Nears Completion

Workmen finishing construction of an army XB-24 bomber on the final outdoor assembly line at Consolidated Aircraft Corp. in San Diego. The plane marks the re-entry into the land plane field by the Consolidated Company, which is now the largest manufacturer of flying boats in the world. Several of these huge bombers are now on the final assembly line. They are powered with four engines rated at 1200 H. P. each. Wide World Photo.

Wings of the Navy

Long-Range Patrol 'Air Battleships' in Commission

By HAROLD KEEN

Released by
North American Newspaper Alliance, Inc.

SAN DIEGO, July 15—The U. S. navy's scouting eyes have acquired "binoculars" that will project the fleet's vision to the most distant theaters of possible sea combat.

This is the isgnificant fact behind the commissioning this month of a new aviation unit, Patrol Squadron 13, at the naval air station here.

It is the first to contain the navy's most recently developed long-range heavy bombing seaplanes, four-motored (1050 h. p. each), 25-ton giants capable of a speed in excess of 200 miles an hour and a nonstop range of 5000 miles.

Their range, with a great load of bombs or aerial torpedoes, will give the fleet a reconaissance scope of 2500 miles from any shore base or refueling vessels at sea, and a terrific striking power to harass or even cripple an approaching hostile force.

The new bombers, built at Consolidated Aircraft Corporation, San Diego, will enable a complete blanketing of such gateways to vital American positions as the Caribbean, the Pacific approaches to Hawaii, Alaska and the Aleutian islands, and the zones in the Far East surrounding the U. S. naval base at Cavite, Philippine islands.

They will extend the present area of scouting operations 1000 round-trip miles beyond that made possible by the navy's present armada of 250 twin-engined PBY-type patrol bombers, based at Pearl harbor, Hawaii; Sitka, Alaska; Cavite, P. I.; Seattle, San Diego, Norfolk and Coco Solo, Canal zone.

The prototype of these veritable battleships of the air, secretly engineered and built over a period of more than three years, was perhaps the most expensive seaplane ever constructed in the United States. Its cost was $1,000,000, with the navy contributing $400,000. This first of the series of recently completed 4-motored bombers startled the world of military aviation October 28, 1938, when it was flown nonstop, while still in an experimental stage, across the continent from San Diego to Anacostia, D. C.—over stretches of land where a forced landing for a seaplane would have been disastrous—in 13 hours, 55 minutes.

Because of its great speed and passenger carrying capacity, it has unequaled value as an overwater—or even overland—transport to effect rapid troop transfers. On long, overnight flights the plane can carry 30 passengers and six crew members, while on shorter jaunts there would be space enough for 50.

Patrol squadron 13 will bear the distinction of containing the most heavily armed aircraft in the navy service, the exact caliber of their guns being a military secret.

9,500 'PLANES FROM U.S.

3,000 Now in England

From DON IDDON, Daily Mail Correspondent

NEW YORK, Friday.

BRITAIN now has given contracts for 9,512 American warplanes, it was revealed to-day. Nearly half of them have been delivered, and 3,000 machines are already in England.

Included in the total are 4,934 'planes ordered by France. They were taken over after the surrender of the Bordeaux Government.

Among the machines delivered and on order are North American trainers, Curtiss pursuit 'planes, Douglas, Martin and Lockheed bombers, Grumman fighters, and Consolidated flying-boats.

Meanwhile, the negotiations, between the Packard Motor Company and Government officials, concerning the construction of Rolls-Royce aviation engines for Britain, continue to be stimulated by the statement issued last night by Mr. Henry Morgenthau, Secretary of the Treasury.

Mr. Morgenthau said that Britain will share in any Rolls-Royce engines produced in America, not only as a matter of fairness, but because of President Roosevelt's policy of giving full aid to the Allies

As Mr. Morrison, Britain's Minister of Supply, revealed in the House of Commons yesterday, every leading aircraft firm in the United States is working on 'planes for the Allies.

In addition, America is also producing great quantities of machine tools.

BRITAIN'S U.S. PLANE BILL—£250,000,000

THE New York Times yesterday printed the following article:—
For the first time since France and Britain placed orders for American airplanes, a detailed and fairly complete picture of the number of types of airplanes purchased can now be made public.

Until now the purchases have been expressed in dollar values, leaving the number of units to guesswork.

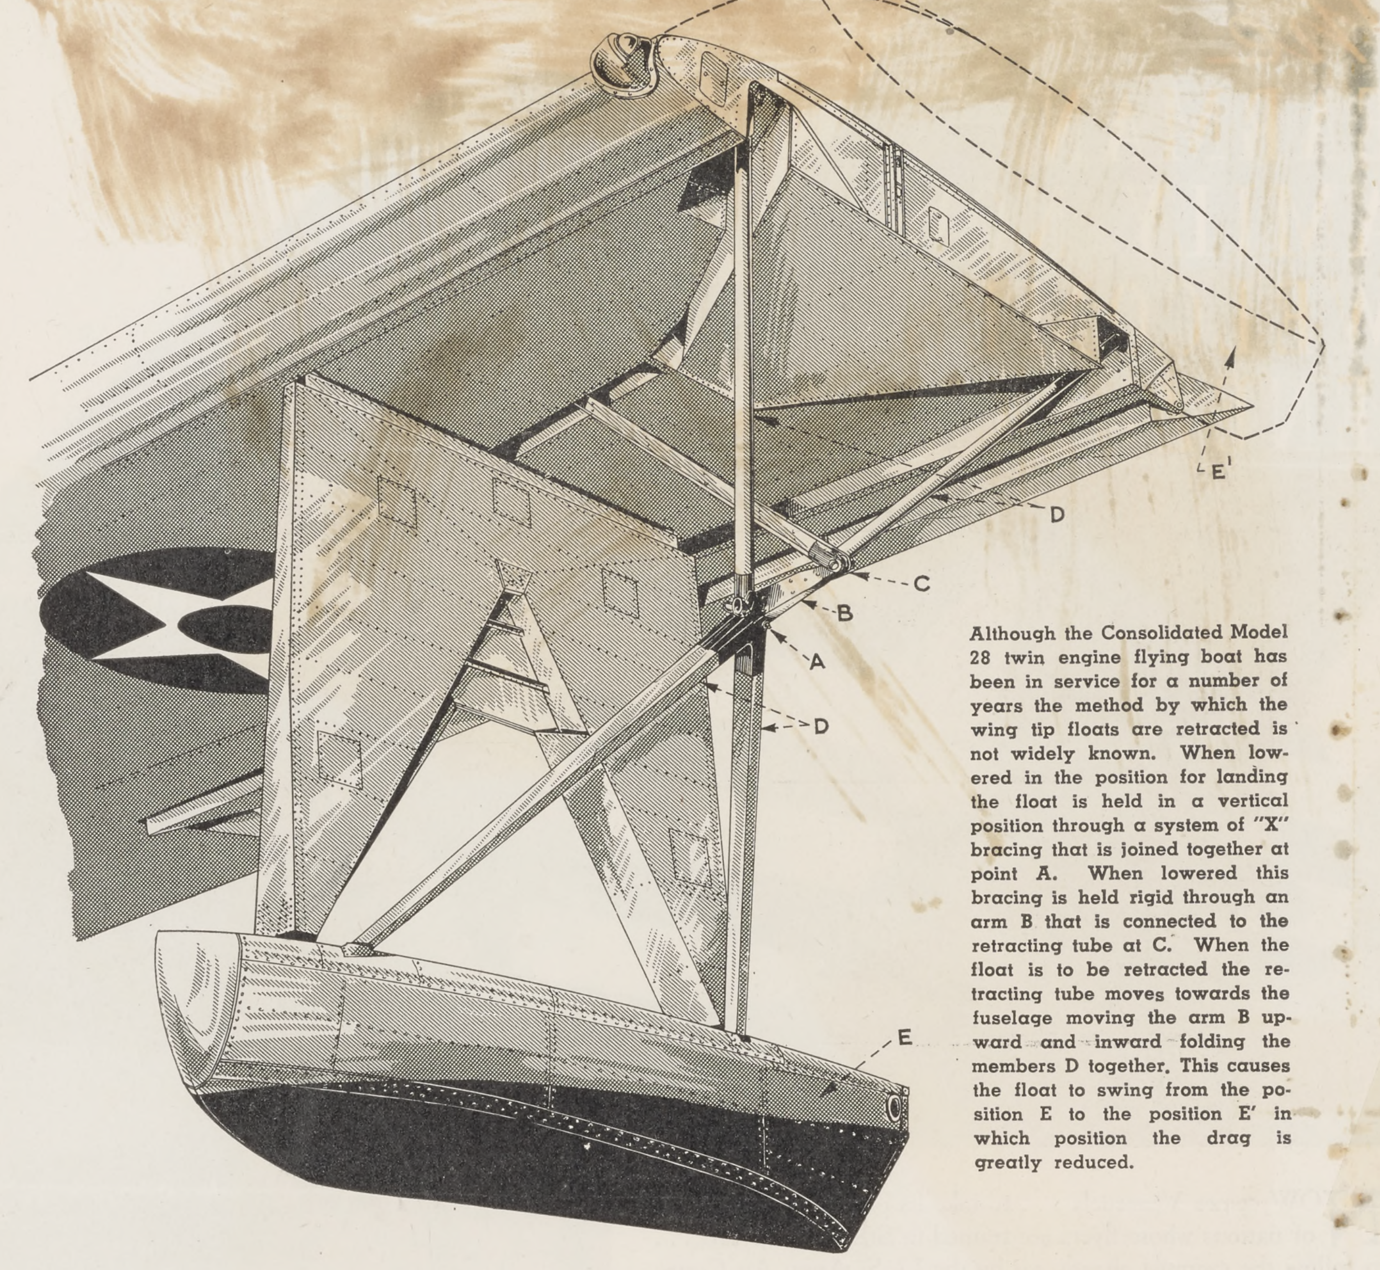
By assuming the French contracts, Britain now holds contracts for 9512 American airplanes, estimated at a cost of more than £250,000,000. Nearly half that number have been delivered—that is, turned over to Allied agents here. How many have been shipped to Europe cannot be definitely learned, but the latest estimate is about 3,000.

British orders in the 10 months of the war were made up as follows:—Douglas bombers, 360; North American trainers, 1165; Lockheed bombers, 1550; Bell Aircobras, 240; Brewster fighters, 150; Consolidated flying-boats, 40.

The arrival in New York this week of Harold F. James of the British Ministry of Aircraft Production is interpreted as meaning that the British plan to place further orders.

AVIATION - June 1940

Charles F. McReynolds
9121 Dalton Ave., L.A.



Although the Consolidated Model 28 twin engine flying boat has been in service for a number of years the method by which the wing tip floats are retracted is not widely known. When lowered in the position for landing the float is held in a vertical position through a system of "X" bracing that is joined together at point A. When lowered this bracing is held rigid through an arm B that is connected to the retracting tube at C. When the float is to be retracted the retracting tube moves towards the fuselage moving the arm B upward and inward folding the members D together. This causes the float to swing from the position E to the position E' in which position the drag is greatly reduced.

Looking aft inside of the fuselage of the Model 28 shows the Zee stringers running lengthwise and the beltframes running crosswise. The large bulkheads in the rear are the 'banjo' bulkheads which extend on up into the fin structure. The tunnel door or hatch is shown on the keel while the two vertical tubes in the foreground are flare tubes.

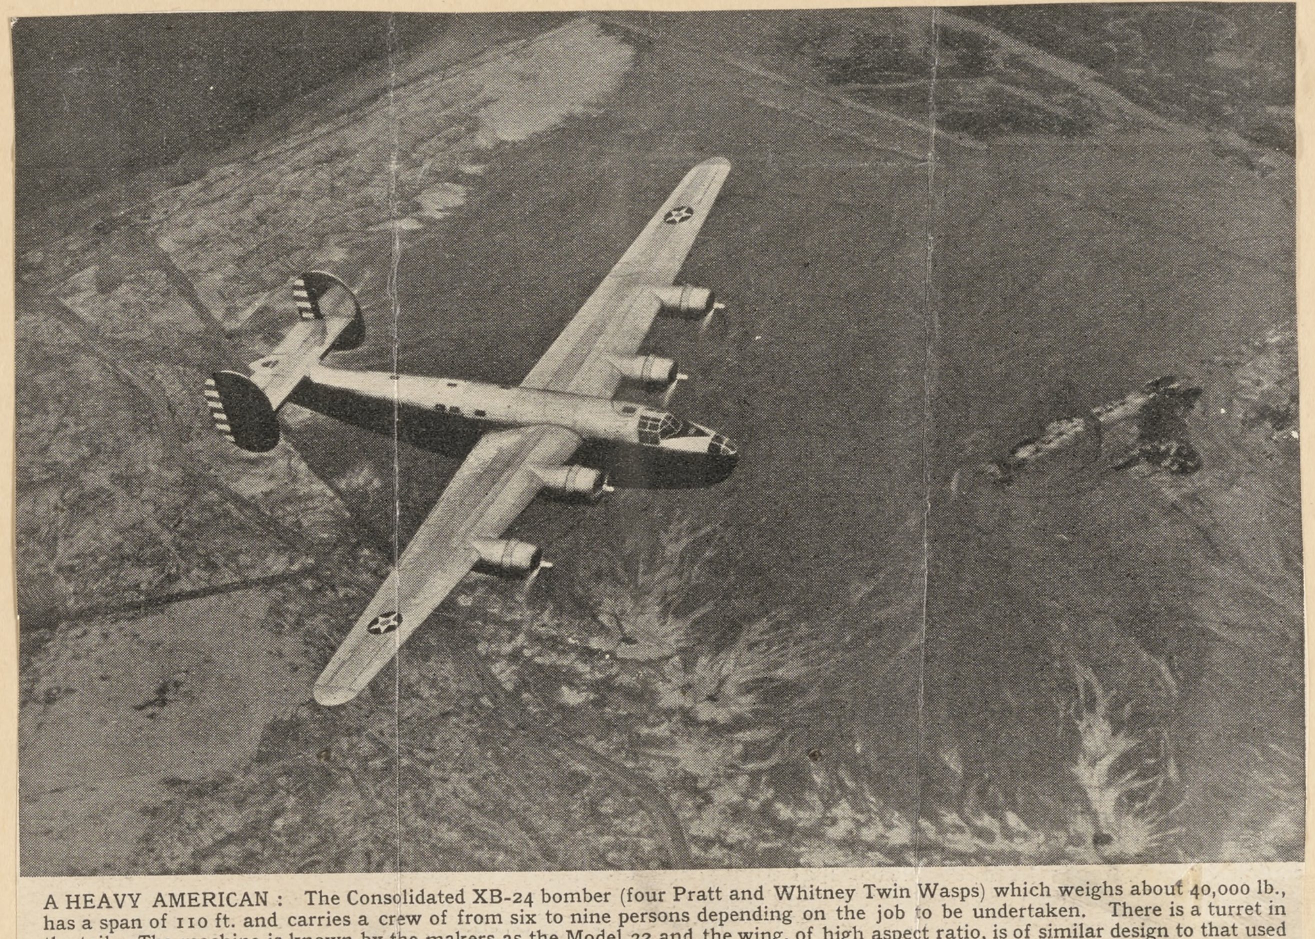
Flight — 7/28/40



A HEAVY AMERICAN : The Consolidated XB-24 bomber (four Pratt and Whitney Twin Wasps) which weighs about 40,000 lb., has a span of 110 ft. and carries a crew of from six to nine persons depending on the job to be undertaken. There is a turret in the tail. The machine is known by the makers as the Model 32 and the wing, of high aspect ratio, is of similar design to that used on the Model 31 flying boat.

THE AIR SERVICES

Consolidated Bomber Tested at San Diego

Now undergoing tests at San Diego, the new Consolidated Model 32 four-engined land bomber marks Consolidated's re-entry into the land plane manufacturing field.

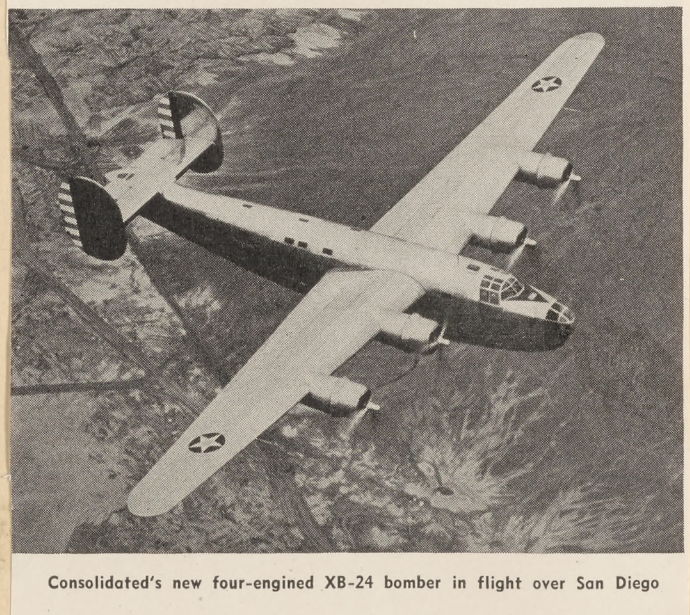
The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 hp each. The propellers are Hamilton Standards of the 3-bladed Hydromatic constant speed type, 12 ft. in diameter. Fowler flaps extend inboard of the ailerons in the wing, with the engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length 64 ft.; and overall height, 19 ft. Tactical requirements are for a crew of from 6 to 9, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with a single retractable wheel forward. Main landing wheels retract into the wing wells.

While performance figures are not available, an official release indicates a speed of more than 300 mph, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons.

(Continued on page 110)



Consolidated's new four-engined XB-24 bomber in flight over San Diego

AERO DIGEST

JUNE '40

and other methods, and as such are used for lateral forming members throughout the flying boat hull, in engine nacelles, and at other points.

Although the draw bench at Consolidated is of standard type, the technique of using it, and the special roller-type dies used for forming the various sections required, have been developed within the department to fit the particular requirements of aircraft manufacture. Single lengths in excess of 50 ft. can be handled on the main draw bench, which is powered by a 50-hp. electric motor, and which handles material up to 0.128 in. thick in present production. In fact, not all of the work of this department is devoted to light alloy structural parts for aircraft; many special parts for tools, jigs and machine guards are drawn or rolled out of various materials including steel up to 1½x3-in. pieces rolled edgewise.

Raw material to be formed is first sheared to required widths from material of the proper alloy, sheet thickness and length. These strips come to the draw bench in rolls and may go through the large draw bench, or be processed on one of several rolling machines, depending on the size and type of shape to be formed. The sections rolled vary widely from simple right-angle bends to multiple curves including "hat" sections with short return bends at the edges to secure maximum structural rigidity. Such a section complicates the rolling process, and requires careful design of the rollers, and demands care in production. The completed sections must conform to strict dimensional requirements. Bend radii must be maintained accurately, and the finished part must not show appreciable loss in section thickness.

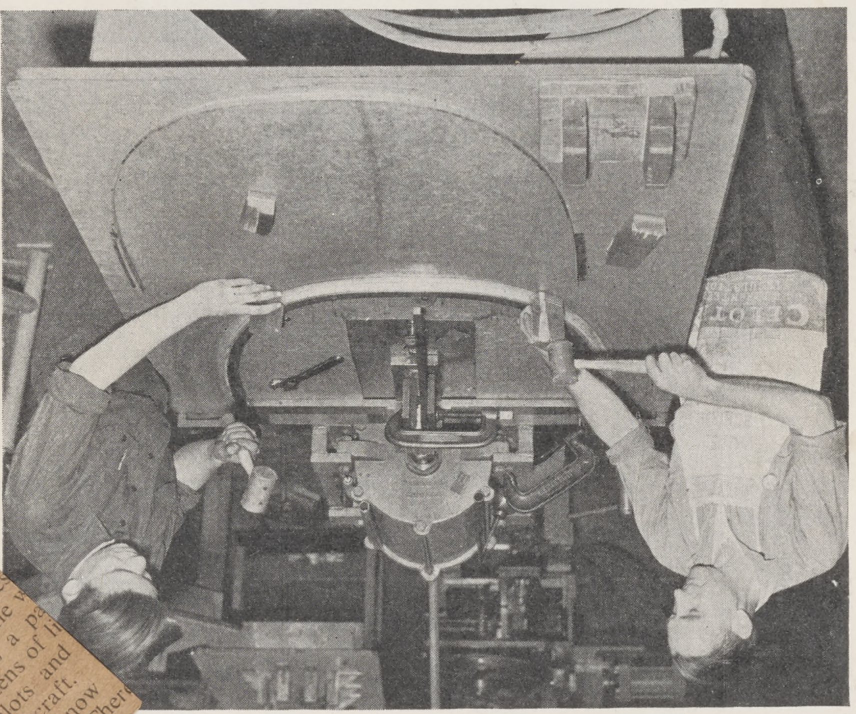
Rolls Carefully Designed

All forming dies are of the roll type, as is required to assure maintenance of the protective layer of pure aluminum on the strip stock. Each roller is carefully designed to impart a new shape to the ribbon of met until it passes through the last se rollers in finished form. Once to shape the sections are r heat-treatment, straightening, pulling, and checking for correct hardness by means of a conventional Rockwell hardness tester.

Forming the sections, as well as heat-treating, results in some distortion of the members from true straightness. Therefore, it is necessary to pass them through a straightening operation. This also serves to work-harden the material to its maximum strength. After heat-treatment, each section to be straightened is placed on a special pneumatic draw-bench machine and pull to just beyond its elastic limit, simneously straightening the section 1 work-hardening the material. Ev section is automatically stamped al its entire length for identificationrposes. This simplifies storing ancnal assembly. After straighteninghe sections are cut into desired lens and formed where such formins necessary to mak part.

Forming light sons is done b and thine. Much ork done on the de-

ha to be shape a ing, or stre ends of the pa forming bar is against the part, proper shape. Operat the material by hamme rawhide hammers. Many forming require a certain am hand hammering with a rawhide mer to bring the part to the require shape, but the basic work throughout is done by machine.



This machine stretches a nearly formed angle or other section around a form of the exact final shape. While it is being stretched, a few blows around the edge of the section sets it so that when the stretching force is relieved the work retains the desired shape

Many Miscellaneous Parts

Total monthly production of the draw-bench department runs to many thousands of feet cf aluminum alloy material. However,this does not adequately express the mportance of the department since mch of its work is devoted to the formig of miscellaneous parts that are idely used for tooling and jigging urposes. Also, much of the work ofhe department is devoted to formin these sections after they are rollecor drawn to shape. Other functior such as rolling engine mount tubeto shape, are also performed in th department. And out of these drabenches and rolling machines comthe various parts, straight or forme that are so widely usesd as ribs, fraework, and stiffening members undehe skin of the giant birds which patı America's sea lanes.

GREAT EXTENSIONS PLANNED

From Our Aeronautical Correspondent

With a veil of secrecy drawn discreetly over the activities of most of the Air Forces of Europe and with the United States pressing ahead to put her air " house " in order, most of the interesting news of aeronautical developments these days comes from the other side of the Atlantic.

The U.S. War Department has completed the entire ordering of the programme for 18,641 army aircraft, so that the army now has on hand, or on order, all the aeroplanes to achieve its goal of 25,000 aircraft by 1942. The navy's goal is 10,000 aeroplanes by the same date.

The Aeronautical Chamber of the United States was reported recently to be contemplating an outlay of a further $100,000,000 (£25,000,000) on aircraft factory construction, $52,000,000 (£13,000,000) having been already spent for this purpose during the first year of war in Europe. If this is done it will add considerably to the production of 1.500 aeroplanes a month which, it is predicted, will be reached next March. There are a number of estimates of the present rate of production, the most frequently stated being 900 or 1,000 a month.

An important obstacle to further expansion of aircraft production was removed when the United States Excess Profits Bill had a provision inserted which will allow industry to liquidate the cost of new defence plant on more liberal terms than previously. Much of the delay in the aircraft programme had been attributed to opposition within the Administration to this provision.

Ford Enterprise

This concession was followed by announcements from several concerns to the effect that their plant was being extended. The Great Britain 20 four-engined Boeing bombers of the "Flying Fortress" type which have already been completed.

The machines of the Consolidated Aircraft Company are reported to be very similar to the "Flying Fortresses," both types being capable of a range of 3,000 miles. The first deliveries of these machines were made to the British last month. The United States Army will accept a delay of approximately three months in its own deliveries of this same type, which is known as the B-24.

General George C. Marshall, Army Chief of Staff, said that in consideration of this priority the British Government had released to the United States sufficient engines to equip 41 Boeing Flying Fortresses, which the United States Army had already accepted without their engines or would have received without engines before January 1. Referring to the Boeing Company's B-17 type of four-engined bomber, General Marshall said that the United States was then negotiating with the British authorities the basis for releasing to them 20 fully equipped aeroplanes except as to the Norden bombsight. The Sperry bombsight, he said, had been released to Great Britain.

Another company making extensions is the United Aircraft Company, which has spent about $16,000,000 on expansion during the past 13 months and has already increased the number of employees on its payroll from 5,000 to 15,000. It is now believed to be preparing to spend $15,000,000 on new facilities for building dive-bombers, airscrews, and engines.

Yet another company which is making bombers, the Glenn L. Martin Company, of Baltimore, is increasing its floor space to 3,000,000 sq. ft. and spending $1,000,000 on machinery and equipment, apart from building construction costs.

An increase from 1,350 men at present employed, to 8,000 or 10,000 is allowed for in the plans prepared by the Curtiss-Wright Company to build an $8,000,000 plant at St. Louis. The new factory will have a floor space of 1,000,000 sq. ft. and will manufacture

---

owered motor-tugs, ferries, and self-propelled redgers, with machinery in some cases up to ,000 b.h.p., are equipped with Diesel-engine enerators supplying current to electric-ropelling motors. In almost all instances eneral Motors Corporation are responsible or the equipment, having developed a type of nstallation which is unusual in several espects. The complete generating unit is lentical with the set which is standardized or the large number of passenger locomotives uilt by the same concern and comprises a 50 b.h.p. two-stroke poppet-valve V-type 2-cylinder engine driving a 600kw. direct-urrent generator at 750 r.p.m. In some essels two or even three units are installed, nd modifications can be provided by adopting an eight or 16-cylinder design. The motor riving the propeller shaft runs at 750 r.p.m. nd is geared down to give a propeller speed f 200 to 250 r.p.m.

Recently three 13½-knot passenger ferries or service at New York were built with nachinery of this class, but perhaps the most otable examples are three 3,500 b.h.p. tugs or the U.S. Navy, also recently completed. Most of the big tugs now on order in America vill have a similar propulsive system, which s claimed to give a relatively light and flexible nstallation, the cost of which is rather lower han that of a plant with direct drive. This an be possible only on account of the large utput due to the adoption of a standard unit apable of being used for both locomotives nd ships.

poppet valves, hydraulically operated on the Meier Mattern system, was produced by the Werkspoor Company and fitted in the steamer Batavier III, with very satisfactory results.

Particulars have just been published of another design of two-stage compound engine, developed by the Stork Company at Hengelo, just before the occupation of Holland, which produces an exceptional degree of economy. The engine has one high-pressure cylinder of 550mm. diameter and two low-pressure cylinders of 900mm. diameter, with a common stroke of 800mm., developing 1,500 i.h.p. at about 125 r.p.m. The high-pressure cylinder is fitted with a piston valve having chrome-hardened surfaces on the working parts, and it has been shown that the wear of the liners is greatly minimized when using superheated steam, with a great improvement in steam tightness. Admission to the low-pressure cylinders is controlled by an improved form of balanced slide valve, which incorporates a relief in the valve cage to give communication between the cylinder space and steam receiver if any excessive rise in compression pressure occurs. Hackworth valve gear is fitted to provide an engine of very small dimensions. The low-pressure cylinder exhausts on the uniflow principle, and the trial results showed a fuel consumption of about 1lb. of coal per h.p. hour, an improvement of 15 to 20 per cent. on the standard triple-expansion engine working with similar steam conditions of about 200lb. steam pressure and 600deg. F. temperature.

AVIATION - June 1940

Charles F. McReynolds

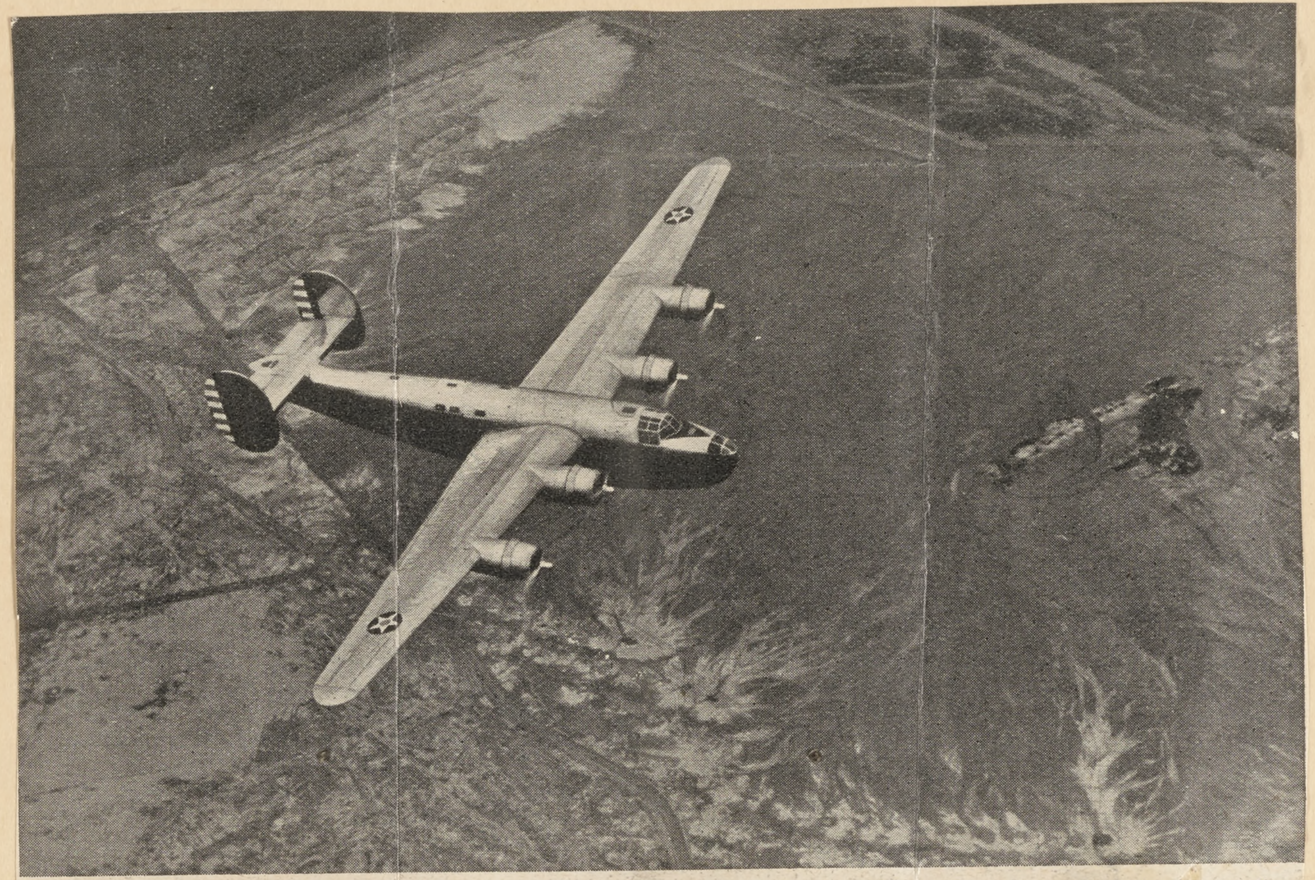
Flight — 7/28/40



A HEAVY AMERICAN: The Consolidated XB-24 bomber (four Pratt and Whitney Twin Wasps) which weighs about 40,000 lb., has a span of 110 ft. and carries a crew of from six to nine persons depending on the job to be undertaken. There is a turret in the tail. The machine is known by the makers as the Model 32 and the wing, of high aspect ratio, is of similar design to that used on the Model 31 flying boat.

THE AIR SERVICES

Consolidated Bomber Tested at San Diego

Now undergoing tests at San Diego, the new Consolidated Model 32 four-engined land bomber marks Consolidated's re-entry into the land plane manufacturing field.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 hp each. The propellers are Hamilton Standards of the 3-bladed Hydromatic constant speed type, 12 ft. in diameter. Fowler flaps extend inboard of the ailerons in the wing, with the engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length 64 ft.; and overall height, 19 ft. Tactical requirements are for a crew of from 6 to 9, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with a single retractable wheel forward. Main landing wheels retract into the wing wells.

While performance figures are not available, an official release indicates a speed of more than 300 mph, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons.

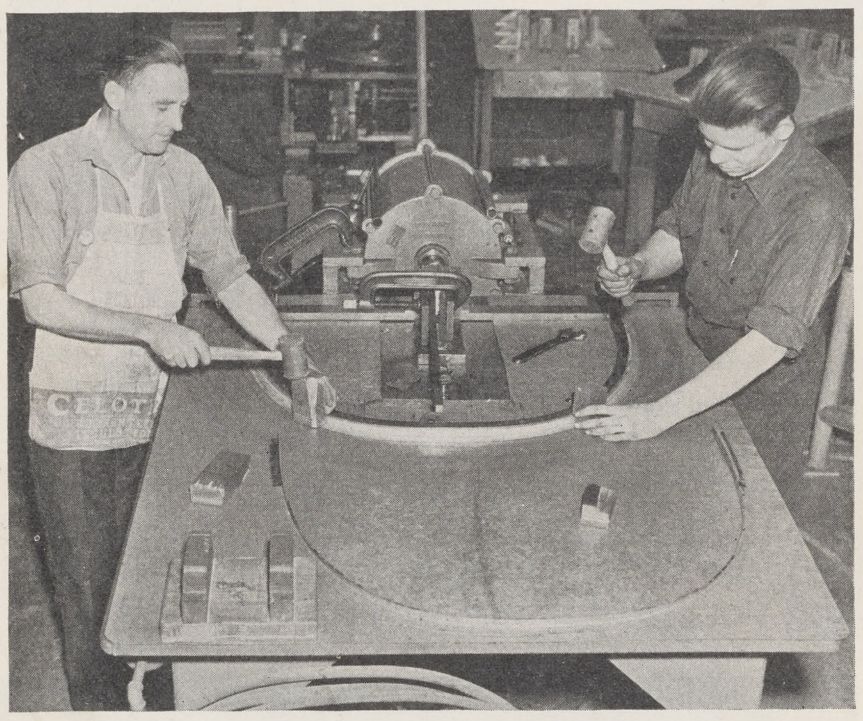
Consolidated's new four-engined XB-24 bomber in flight over San Diego

JUNE '40

and other methods, and as such are used for lateral forming members throughout the flying boat hull, in engine nacelles, and at other points.

Although the draw bench at Consolidated is of standard type, the technique of using it, and the special roller-type dies used for forming the various sections required, have been developed within the department to fit the particular requirements of aircraft manufacture. Single lengths in excess of 50 ft. can be handled on the main draw bench, which is powered by a 50-hp. electric motor, and which handles material up to 0.128 in. thick in present production. In fact, not all of the work of this department is devoted to light alloy structural parts for aircraft; many special parts for tools, jigs and machine guards are drawn or rolled out of various materials including steel up to $1\frac{1}{2}$x3-in. pieces rolled edgewise.



This machine stretches a nearly formed angle or other section around a form of the exact final shape. While it is being stretched, a few blows around the edge of the section sets it so that when the stretching force is relieved the work retains the desired shape

Raw material to be formed is first sheared to required widths from material of the proper alloy, sheet thickness and length. These strips come to the draw bench in rolls and may go through the large draw bench, or be processed on one of several rolling machines, depending on the size and type of shape to be formed. The sections rolled vary widely from simple right-angle bends to multiple curves including "hat" sections with short return bends at the edges to secure maximum structural rigidity. Such a section complicates the rolling process, and requires careful design of the rollers, and demands care in production. The completed sections must conform to strict dimensional requirements. Bend radii must be maintained accurately, and the finished part must not show appreciable loss in section thickness.

Rolls Carefully Designed

All forming dies are of the roll type, as is required to assure maintenance of the protective layer of pure aluminum on the strip stock. Each roller is carefully designed to impart a new shape to the ribbon of metal until it passes through the last set of rollers in finished form. Once drawn to shape the sections are ready for heat-treatment, straightening, pulling, and checking for correct hardness by means of a conventional Rockwell hardness tester.

Forming the sections, as well as heat-treating, results in some distortion of the members from true straightness. Therefore, it is necessary to pass them through a straightening operation. This also serves to work-harden the material to its maximum strength. After heat-treatment, each section to be straightened is placed on a special pneumatic draw-bench machine and pul to just beyond its elastic limit, simneously straightening the section work-hardening the material. Ev section is automatically stamped al its entire length for identificationrposes. This simplifies storing ancnal assembly. After straighteninghe sections are cut into desired lehs and formed where such formins necessary to make the part.

Forming of these light sons is done both by hand and chine. Much of the forming work done on special rolling machines, we the perfection of the finished p depends largely on the skill and istry of the individual operator. s a guide he uses a special masteorm jig, which employs adjustableorm blocks and may be set for any cred form.

The operator checks his ork against this master pattern and lls the part in his machine until ias received the proper round, ovor other form.

Wide use is also made of a pn-matic forming table using stand forming bars usually of semi-circu, half-oval or similar shapes. The pi to be formed is rolled to approxim shape and is then placed on the for ing, or stretching table, and the op ends of the part are clamped fast. Ti forming bar is pneumatically forc against the part, stretching it t proper shape. Operators usually "set the material by hammering it witl rawhide hammers. Many types o forming require a certain amount o hand hammering with a rawhide hammer to bring the part to the required shape, but the basic work throughout is done by machine.

Many Miscellaneous Parts

Total monthly production of the draw-bench department runs to many thousands of feet cf aluminum alloy material. However,this does not adequately express the mportance of the department since mch of its work is devoted to the formig of miscellaneous parts that are idely used for tooling and jigging urposes. Also, much of the work ofhe department is devoted to formin these sections after they are rollecor drawn to shape. Other functior such as rolling engine mount tubeto shape, are also performed in th department. And out of these drawbenches and rolling machines comthe various parts, straight or forme that are so widely usesd as ribs, fraework, and stiffening members undehe skin of the giant birds which patr America's sea lanes.

GREAT EXTENSIONS PLANNED

From Our Aeronautical Correspondent

With a veil of secrecy drawn discreetly over the activities of most of the Air Forces of Europe and with the United States pressing ahead to put her air " house " in order, most of the interesting news of aeronautical developments these days comes from the other side of the Atlantic.

The U.S. War Department has completed the entire ordering of the programme for 18,641 army aircraft, so that the army now has on hand, or on order, all the aeroplanes to achieve its goal of 25,000 aircraft by 1942. The navy's goal is 10,000 aeroplanes by the same date.

The Aeronautical Chamber of the United States was reported recently to be contemplating an outlay of a further $100,000,000 (£25,000,000) on aircraft factory construction, $52,000,000 (£13,000,000) having been already spent for this purpose during the first year of war in Europe. If this is done it will add considerably to the production of 1.500 aeroplanes a month which, it is predicted, will be reached next March. There are a number of estimates of the present rate of production, the most frequently stated being 900 or 1,000 a month.

An important obstacle to further expansion of aircraft production was removed when the United States Excess Profits Bill had a provision inserted which will allow industry to liquidate the cost of new defence plant on more liberal terms than previously. Much of the delay in the aircraft programme had been attributed to opposition within the Administration to this provision.

Ford Enterprise

This concession was followed by announcements from several concerns to the effect that their plant was being extended. The Ford Motor Company is reported to have begun preliminary engineering work for the construction of an $11,000,000 aircraft engine factory. A statement to this effect was made by Mr. Edsel Ford, president of the company, in Detroit after an order for 4,000 engines had been received from the U.S. Government. Mr. Ford added that construction contracts would be awarded soon and the factory would be completed within four months after the ground had been broken. The first engine was expected to be turned out between two and four months later. About 10,000 people will be employed in this latest Ford enterprise. Construction of the works will cost $4,000,000 and tools and equipment $7,000,000. The factory will make engines to the value of $69,000,000 for the United States War Department. This factory will be the second large works to be built in Detroit for defence work. The Chrysler Corporation has already broken ground for the construction of a $20,000,000 tank factory which has a Government order for tanks to the value of $33,000,000.

The engines to be built at the new Ford works are the Pratt and Whitney Double Wasp type, a radial air-cooled engine of 18 cylinders in two banks, capable of developing nearly 3,000 h.p. Only a few of these engines are in service at the moment. Mr. Ford also intends to produce an aeroplane of his own design. He has not yet disclosed what type of aircraft it will be, though it was reported recently that it will be similar to the Lockheed P.38 fighter, which is said to be the world's fastest fighter aircraft. The new Ford aeroplane will have a 24-cylinder V-type engine, modelled on the 24-cylinder Hispano-Suiza. Officials of the Ford Company have not revealed in what market they intend to sell the aircraft, but one of them said that the engine would serve for both civil and military use. A cannon, firing a 2lb. shell, can be fitted with the engine. Presumably it would nestle into the " V " of the cylinders and fire through the propeller.

Other Extensions

Mr. Donald Douglas, president of the Douglas Aircraft Company, stated that the United States Government's £35,000,000 contract for warplanes given to his firm would necessitate extensive factory extension. He added that the aeroplanes to be built would be similar in design to the fighters being delivered to Britain, although vastly superior in speed, range and striking ability.

The Boeing Aircraft Corporation, builders of the four-motor " Flying Fortress " bomber, is stated to be spending $7,000,000 to $8,000,000 in Seattle and about $3,000,000 in Wichita, Kansas, where training aircraft are being manufactured.

It was announced recently that the United States Army High Command has given Great Britain priority on the delivery of 26 four-engined bombers at present at the factory of the Consolidated Aircraft Company at San Diego, California. It is understood that they will be delivered on or before March 1. The High Command simultaneously announced that negotiations are under way for giving Great Britain 20 four-engined Boeing bombers of the " Flying Fortress " type which have already been completed.

The machines of the Consolidated Aircraft Company are reported to be very similar to the " Flying Fortresses," both types being capable of a range of 3,000 miles. The first deliveries of these machines were made to the British last month. The United States Army will accept a delay of approximately three months in its own deliveries of this same type, which is known as the B-24.

General George C. Marshall, Army Chief of Staff, said that in consideration of this priority the British Government had released to the United States sufficient engines to equip 41 Boeing Flying Fortresses, which the United States Army had already accepted without their engines or would have received without engines before January 1. Referring to the Boeing Company's B-17 type of four-engined bomber, General Marshall said that the United States was then negotiating with the British authorities the basis for releasing to them 20 fully equipped aeroplanes except as to the Norden bombsight. The Sperry bombsight, he said, had been released to Great Britain.

Another company making extensions is the United Aircraft Company, which has spent about $16,000,000 on expansion during the past 13 months and has already increased the number of employees on its payroll from 5,000 to 15,000. It is now believed to be preparing to spend $15,000,000 on new facilities for building dive-bombers, airscrews, and engines.

Yet another company which is making bombers, the Glenn L. Martin Company, of Baltimore, is increasing its floor space to 3,000,000 sq. ft. and spending $1,000,000 on machinery and equipment, apart from building construction costs.

An increase from 1,350 men at present employed, to 8,000 or 10,000 is allowed for in the plans prepared by the Curtiss-Wright Company to build an $8,000,000 plant at St. Louis. The new factory will have a floor space of 1,000,000 sq. ft. and will manufacture radial engines, airscrews, and fighter aircraft. North American Aviation, Inc., is to spend $10,500,000 on training aircraft alone.

New Inventions

There are also reports from the United States of a number of new inventions. Major W. Goddard, U.S. Army Research chief, said recently, after he had seen tests at Rochester, N.Y., that new photographic inventions will enable aerial observers to see enemy movements at night almost as well as by day. Pictures taken from a height of a mile showed clear detail, thanks to a new light " bomb " which lit up the sky " just like the setting sun." Tests were made with a camera having photo-electric cells to operate the shutter when illumination reached the peak, while the film wound automatically after each exposure. He added that the new equipment enabled observers to take pictures, develop them in mid-air, and transmit them by radio to bomber and artillery commands.

Rapid progress is reported from the United States with experiments in the art of making warplanes extremely difficult to detect from the ground, from fighters above them, and even when caught in the searchlights at night. One set of experiments is being conducted by the U.S. Army Air Corps at Wright Field, Dayton, Ohio. The best results are said to have been obtained from a mottled combination of dull greens and browns on the aeroplane's upper surfaces, to confuse fighters above them. On the lower surfaces a solid application of lampblack has been found to make machines much less visible in searchlights. A four-motor Boeing bomber, its under side thickly blacked, was reported recently to have flown unseen through the beams of 800,000,000 candle-power searchlights. New United States fighters are being camouflaged in various ways to match the terrain over which they are to be tested. Some are treated with flat colours, heightened with brilliant red and yellow stripes, while other compounds are dull grey and bright aluminium, the first for use on grey, misty days, and the second for bright, sunny weather.

Plans for a flying " bumblebee " aeroplane, a tiny robot of a new type, for defence against bombers, were announced last month by Mr. Edward Chandler, the American marine engineer. The " bumblebee " would steer itself automatically by the sound of the attacking bomber and would then " buzz along " with it, dropping sound-directed bombs on its victim. It sounds fantastic—but one never knows in these days. According to Mr. Chandler, the small aircraft would be launched from a bombing defence station when the course of attacking bombers had been charted with fair accuracy and while they were still some miles away.

The most powerful aero-engine in the world developing 2,200 h.p.,is claimed to be in process of manufacture at the newly expanded factory of the Wright Aeronautical Corporation at Paterson, New Jersey. The engine was inspected by Mr. William Knudsen, member of the National Defence Commission. It is said that it is more powerful than any other engine of its type to the extent of 400 h.p.,and that four

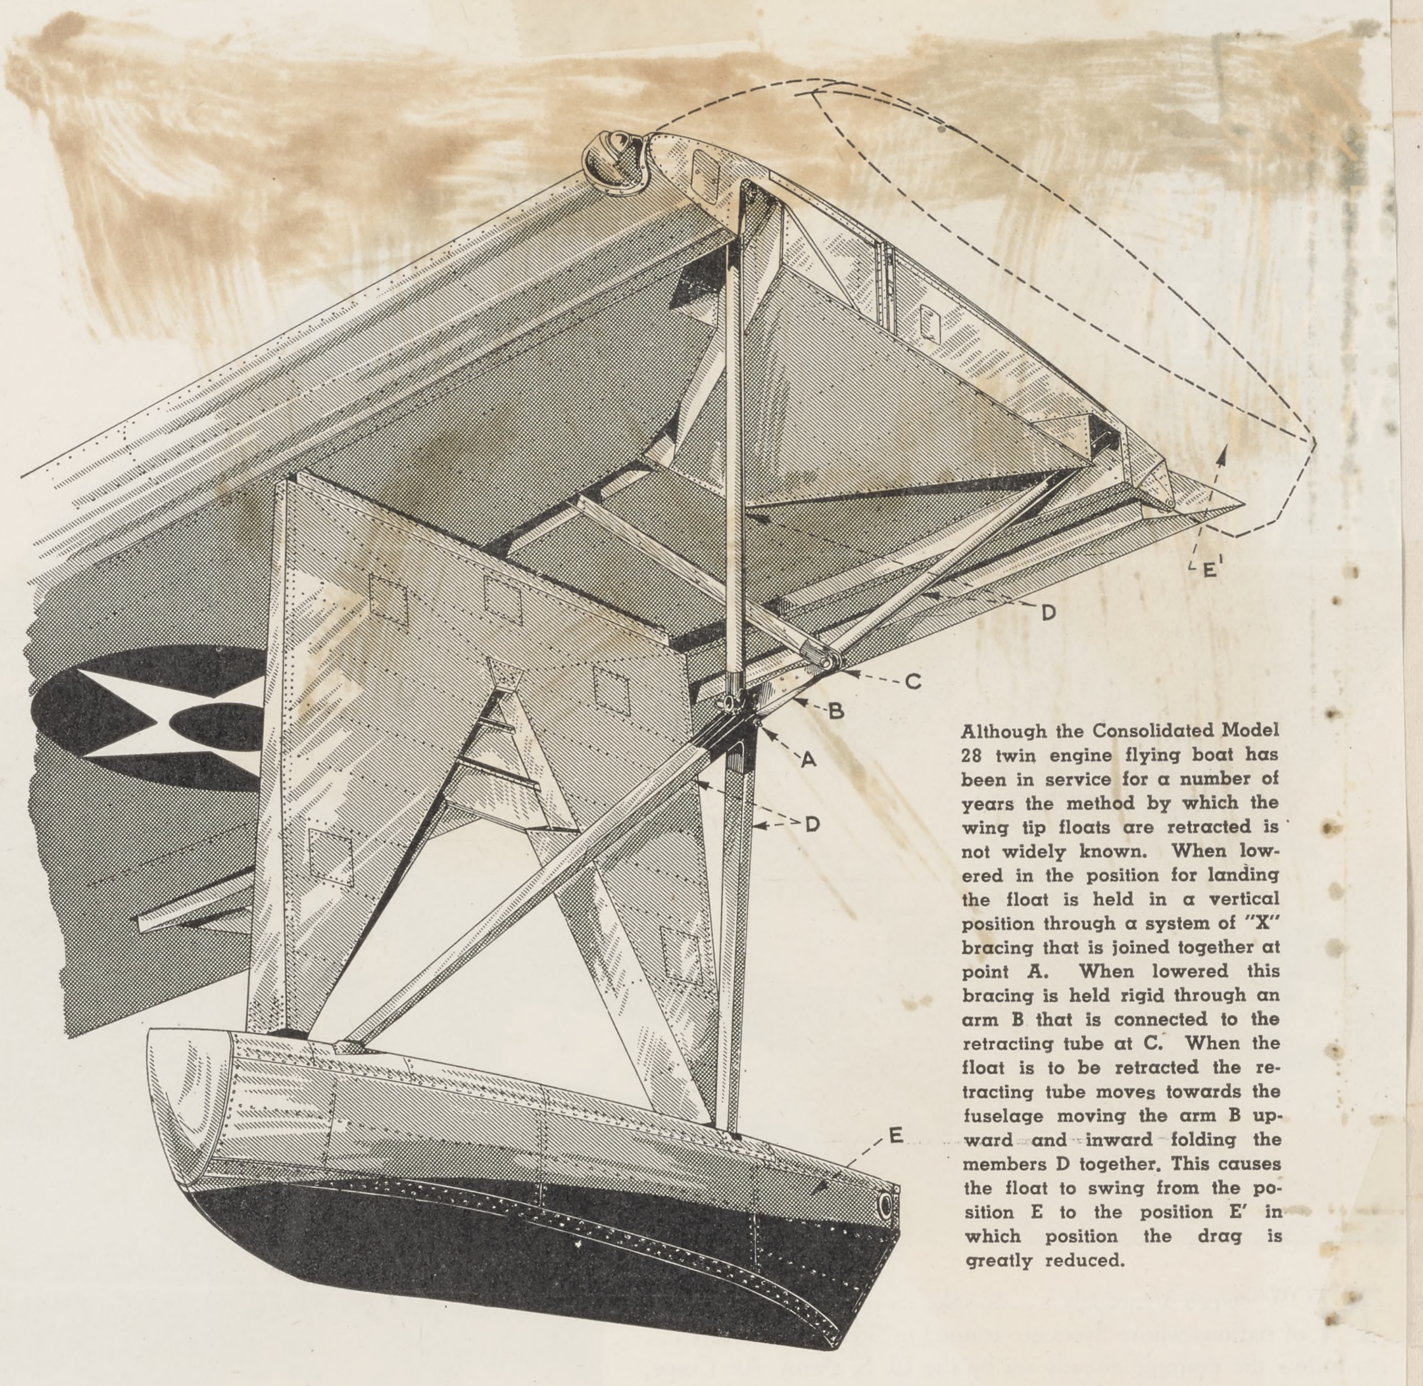
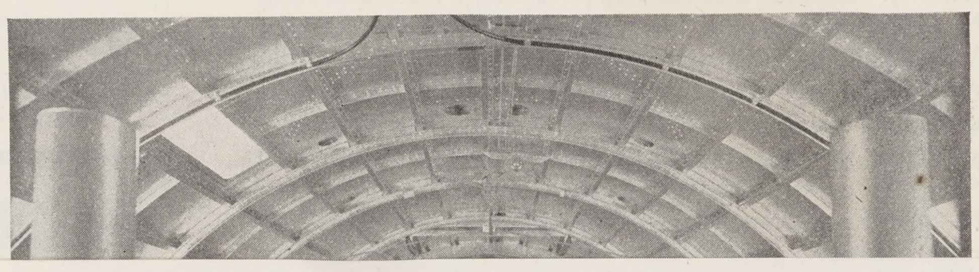
AVIATION - June 1940

Charles F. McReynolds
9121 Dalton Ave., L.A.



Although the Consolidated Model 28 twin engine flying boat has been in service for a number of years the method by which the wing tip floats are retracted is not widely known. When lowered in the position for landing the float is held in a vertical position through a system of "X" bracing that is joined together at point A. When lowered this bracing is held rigid through an arm B that is connected to the retracting tube at C. When the float is to be retracted the retracting tube moves towards the fuselage moving the arm B upward and inward folding the members D together. This causes the float to swing from the position E to the position E' in which position the drag is greatly reduced.



Looking aft inside of the fuselage of the Model 28 shows the Zee stringers running lengthwise and the beltframes running crosswise. The large bulkheads in the rear are the 'banjo' bulkheads which extend on up into the fin structure. The tunnel door or hatch is shown on the keel while the two vertical tubes

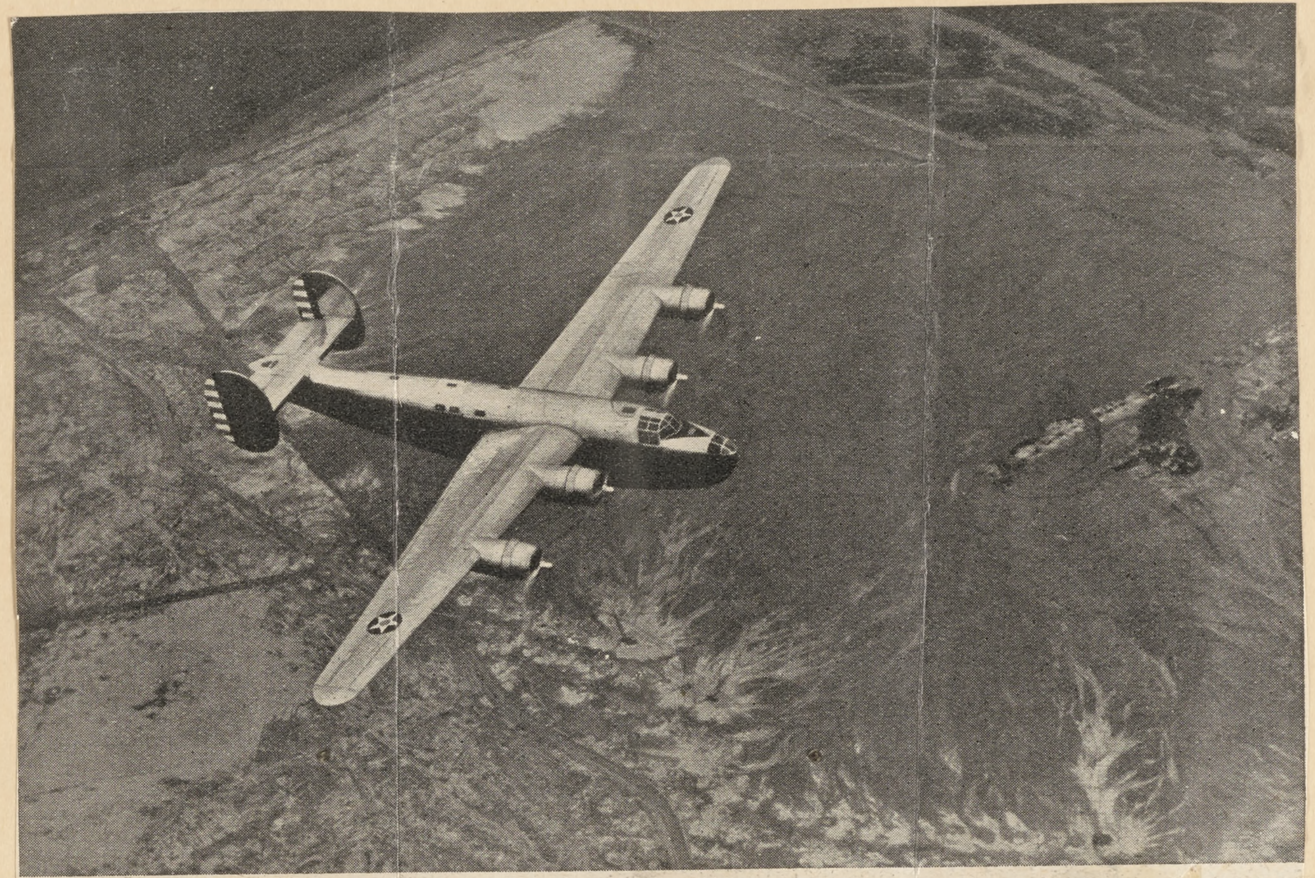
Flight — 7/28/40



A HEAVY AMERICAN: The Consolidated XB-24 bomber (four Pratt and Whitney Twin Wasps) which weighs about 40,000 lb., has a span of 110 ft. and carries a crew of from six to nine persons depending on the job to be undertaken. There is a turret in the tail. The machine is known by the makers as the Model 32 and the wing, of high aspect ratio, is of similar design to that used on the Model 31 flying boat.

THE AIR SERVICES

Consolidated Bomber Tested at San Diego

Now undergoing tests at San Diego, the new Consolidated Model 32 four-engined land bomber marks Consolidated's re-entry into the land plane manufacturing field.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 hp each. The propellers are Hamilton Standards of the 3-bladed Hydromatic constant speed type, 12 ft. in diameter. Fowler flaps extend inboard of the ailerons in the wing, with the engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length 64 ft.; and overall height, 19 ft. Tactical requirements are for a crew of from 6 to 9, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with a single retractable wheel forward. Main landing wheels retract into the wing wells.

While performance figures are not available, an official release indicates a speed of more than 300 mph, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons.

Consolidated's new four-engined XB-24 bomber in flight over San Diego

AERO DIGEST

JUNE '40

and other methods, and as such are used for lateral forming members throughout the flying boat hull, in engine nacelles, and at other points.

Although the draw bench at Consolidated is of standard type, the technique of using it, and the special roller-type dies used for forming the various sections required, have been developed within the department to fit the particular requirements of aircraft manufacture. Single lengths in excess of 50 ft. can be handled on the main draw bench, which is powered by a 50-hp. electric motor, and which handles material up to 0.128 in. thick in present production. In fact, not all of the work of this department is devoted to light alloy structural parts for aircraft; many special parts for tools, jigs and machine guards are drawn or rolled out of various materials including steel up to 1½x3-in. pieces rolled edgewise.

Raw material to be formed is first sheared to required widths from material of the proper alloy, sheet thickness and length. These strips come to the draw bench in rolls and may go through the large draw bench, or be processed on one of several rolling machines, depending on the size and type of shape to be formed. The sections rolled vary widely from simple right-angle bends to multiple curves including "hat" sections with short return bends at the edges to secure maximum structural rigidity. Such a section complicates the rolling process, and requires careful design of the rollers, and demands care in production. The completed sections must conform to strict dimensional requirements. Bend radii must be maintained accurately, and the finished part must not show appreciable loss in section thickness.

Rolls Carefully Designed

All forming dies are of the roll type, as is required to assure maintenance of the protective layer of pure aluminum on the strip stock. Each roller is carefully designed to impart a new shape to the ribbon of metal until it passes through the last set of rollers in finished form. Once drawn to shape the sections are ready for heat-treatment, straightening, pulling, and checking for correct hardness by means of a conventional Rockwell hardness tester.

Forming the sections, as well as heat-treating, results in some distortion of the members from true straightness. Therefore, it is necessary to pass them through a straightening operation. This also serves to work-harden the material to its maximum strength. After heat-treatment, each section to be straightened is placed on a special pneumatic draw-bench machine and pul to just beyond its elastic limit, simneously straightening the section 1 work-hardening the material. Ev section is automatically stamped al its entire length for identificationrposes. This simplifies storing ancnal assembly. After straighteninghe sections are cut into desired lehs and formed where such formins necessary to make the part.

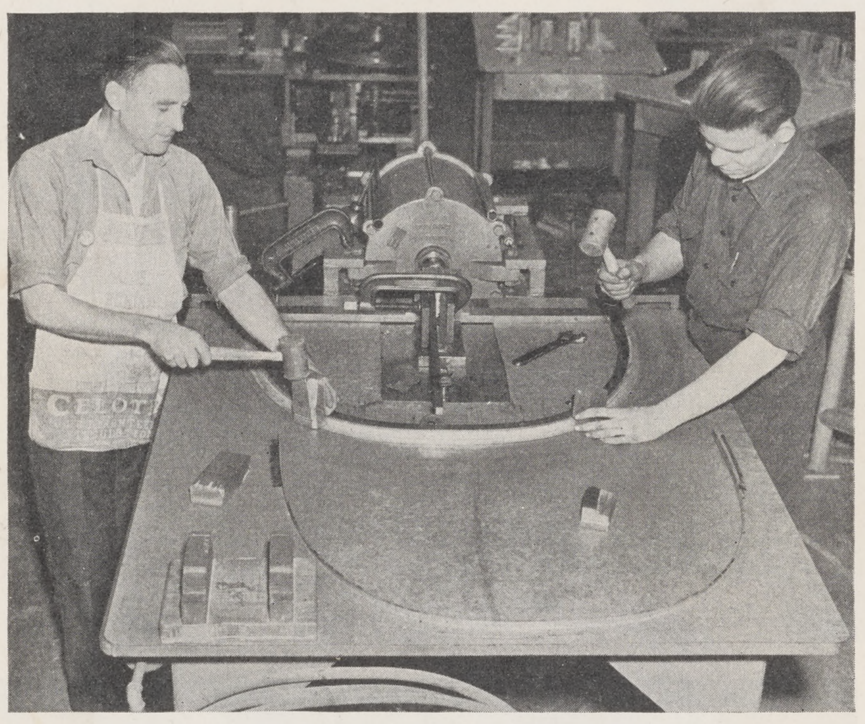
Forming of these light seons is done both by hand and chine. Much of the forming work done on special rolling machines, we the perfection of the finished p depends largely on the skill and istry of the individual operator. s a guide he uses a special masteorm jig, which employs adjustablorm blocks and may be set for any cred form.

The operator checks his ork against this master pattern andlls the part in his machine until ias received the proper round, ovor other form.

Wide use is also made of a pi-matic forming table using stand forming bars usually of semi-circu half-oval or similar shapes. The p to be formed is rolled to approxim shape and is then placed on the for ing, or stretching table, and the op ends of the part are clamped fast. T forming bar is pneumatically force against the part, stretching it t proper shape. Operators usually "set the material by hammering it witl rawhide hammers. Many types o forming require a certain amount o hand hammering with a rawhide hammer to bring the part to the required shape, but the basic work throughout is done by machine.

Many Miscellaneous Parts

Total monthly production of the draw-bench department runs to many thousands of feet cf aluminum alloy material. However,this does not adequately express the mportance of the department since mch of its work is devoted to the formig of miscellaneous parts that are idely used for tooling and jigging urposes. Also, much of the work ofhe department is devoted to formin these sections after they are rollecor drawn to shape. Other functior such as rolling engine mount tubeto shape, are also performed in th department. And out of these drawbenches and rolling machines comthe various parts, straight or forme that are so widely usesd as ribs, fraework, and stiffening members undehe skin of the giant birds which pati America's sea lanes.



This machine stretches a nearly formed angle or other section around a form of the exact final shape. While it is being stretched, a few blows around the edge of the section sets it so that when the stretching force is relieved the work retains the desired shape

---

of them will give the new Douglas bomber a range of 6,000 miles and enable it to carry 18 tons of bombs and a crew of 12.

Mr. Jack Knight, the test pilot, said recently that the new Airacobra fighter had attained a speed of 520 m.p.h., and in a dive could touch 700 m.p.h. From time to time there have been unconfirmed reports that this type has been ordered by the British Purchasing Commission. If it can reach these speeds it would certainly be useful.

Giant Bomber

Much interest has been taken in the United States in an announcement that a new giant Douglas bomber, the B-19, built for the U.S. Air Corps, and about three times as big as the " Flying Fortress," was ready for testing at Santa Monica, California, where it was built. The B-19 is the largest aeroplane ever built, with a wing span of 212ft. It weighs 60 tons fully loaded, and its tanks hold enough fuel for a trip of 7,500 miles—enough for a non-stop return trip across the Atlantic. Its four Wright-Duplex motors of 1,200 h.p. are claimed to give the giant a cruising speed of 200 m.p.h. Officials of the company said that she could carry her crew of 10 with 18 tons of bombs to Europe and back non-stop, or could carry 125 fully armed men to the Philippines as a troop transport. The B-19 has taken four years to build and cost £750,000.

If, as has frequently been reported, an arrangement to standardize British and American aircraft types has been arrived at, it will smooth away a matter which has given rise to a great deal of difficulty and delay in the past. Mr. Henry Morgenthau, United States Secretary of the Treasury, said some time ago that an approximation of design had been brought about in the Curtiss-Wright plant at Buffalo whereby six P40 pursuit aeroplanes were being turned out daily for the two countries. He also believed that Consolidated Aircraft, at San Diego, were building standardized flying-boats and four-motor bombers and would shortly improve output by this means.

With the two countries collaborating so closely in the matter of aircraft production it is only natural that each should profit by the other's experience and embody any features which are likely to be useful in aerial warfare. Thus, a report that the British Fraser-Nash power-operated gun turret had been made available to the United States caused no surprise. This was followed by unofficial reports that a bomb-sight which is described as capable of use " with almost miraculous results " had been released by the United States to Britain.

Britain's Share of Output

From time to time there have been widely differing estimates of the number of United States aircraft which are being sent to Britain. Some of them are clearly wildly inaccurate, and must be taken with great reserve. Although no figure was mentioned the best guide was given by President Roosevelt, when he said that Britain was getting 45 per cent. of new construction, the remainder being retained by the United States. He said also that he had established a " rule of thumb policy " by which Britain and Canada, on the one hand, and the United States on the other, would receive defence items coming off the factory lines on a 50-50 basis. These items included large bombers. The Priorities Board then announced that the British Purchasing Commission would be permitted to negotiate for orders with the American aviation industry for an additional 12,000 aeroplanes. This would bring the total number under order to 26,000.

Discussing this matter, Mr. Morgenthau indicated that a large number of the aircraft would be long-range heavy bombers, while Sir Louis Beale, a member of the British Purchasing Commission, said that Britain was now assured of " an overwhelming mass of power." He revealed that orders worth more than £500,000,000, including those taken over from France, had been placed in the U.S.A. during the first year of war.

This is an impressive figure. It suggests that by the middle of next year Britain should be well on the way to making up the leeway in aircraft strength.

---

of two fast motor passenger ships under construction in Denmark and Sweden respectively, intended for service across the North Sea. No doubt they will be completed, although with some delay, but it is difficult to see upon what work they will be engaged until the war concludes.

From every standpoint they are notable vessels. One is the Saga, which is being built at Gothenburg for the Swedish Lloyd's trade between Gothenburg and Tilbury. In the summer the demand for passenger accommodation on this service has, in the past, been very large, and the two vessels normally engaged, the Suecia and Britannia, have had to be supplemented by an older ship. It was decided to build a vessel somewhat faster than the existing tonnage, with a speed of 18½ knots in service, and Diesel propulsion was adopted. The installation is novel, comprising as it does four engines totalling 6,500 b.h.p. and driving a single shaft through gearing and A.S.E.A. electric couplings. The engines operate at the relatively high speed of 270 r.p.m. and the normal propeller speed is 115 r.p.m. B. & W. trunk-piston machinery of the four-stroke class is installed, the reason for its adoption being, no doubt, the low height of the engine-room thereby rendered possible. This is important in a vessel of the moderate dimensions of the Saga, which is 415ft. long with a beam of 55ft. She will carry 150 first-class, 90 second-class and 100 third-class passengers; in addition there is space for 2,000 tons of cargo, and a substantial number of motor-cars.

The other North Sea passenger ship that has been launched is the Kronprins Frederik for the United Steamship Company's Harwich-Esbjerg service. The four motor-vessels that have already been built for this trade are designed for a speed of 16-17 knots, but the new ship represents a great advance, since she will have a speed of 20¼ knots. Moreover, she is much larger, being 370ft. long with a beam of 49ft. 3in. and a gross register of 3,800 tons or 4,900 tons displacement. With such a ship about five hours would be saved on the journey between Copenhagen and London, and it was the intention, when the order was placed, to contract for a second similar vessel as soon as the Kronprins Frederik had proved her success in service. The machinery installation differs entirely from that of the Saga, although the output is only slightly different, being about 7,000 b.h.p. or 8,400 i.h.p. Two B. & W. single-acting two-stroke ten-cylinder engines are to be installed, driving the propellers direct at 165 r.p.m. She will have accommodation for between 200 and 250 passengers.

Diesel-electric Propulsion

The expectations of many engineers and shipbuilders some years ago, that electric propulsion, particularly in conjunction with Diesel engines, would be widely adopted has not been fulfilled. Admittedly the Hamburg-Amerika Line, three or four years ago, decided to standardize this system for all its new tonnage (including a new transatlantic liner upon which work has been suspended since the war), but no other shipowners have shown any interest in the subject. Particularly significant is the fact that while there are between 150 and 200 cargo ships and passenger liners on order in America, all with indirect drive, not one will have electric transmission.

Nevertheless electric propulsion is not wholly dead. A large proportion of the high-powered motor-tugs, ferries, and self-propelled dredgers, with machinery in some cases up to ,000 b.h.p., are equipped with Diesel-engine generators supplying current to electric-propelling motors. In almost all instances General Motors Corporation are responsible for the equipment, having developed a type of installation which is unusual in several respects. The complete generating unit is identical with the set which is standardized for the large number of passenger locomotives built by the same concern and comprises a 50 b.h.p. two-stroke poppet-valve V-type 2-cylinder engine driving a 600kw. direct-current generator at 750 r.p.m. In some vessels two or even three units are installed, and modifications can be provided by adopting an eight or 16-cylinder design. The motor driving the propeller shaft runs at 750 r.p.m. and is geared down to give a propeller speed of 200 to 250 r.p.m.

Recently three 13½-knot passenger ferries for service at New York were built with machinery of this class, but perhaps the most notable examples are three 3,500 b.h.p. tugs for the U.S. Navy, also recently completed. Most of the big tugs now on order in America will have a similar propulsive system, which is claimed to give a relatively light and flexible installation, the cost of which is rather lower than that of a plant with direct drive. This can be possible only on account of the large output due to the adoption of a standard unit capable of being used for both locomotives and ships.

of triple and quadruple expansion engines, using saturated steam, were being generally adopted for cargo tonnage requiring up to about 3,000 h.p. because of their low first cost and reduced upkeep costs. Various improvements in detail have been introduced during the intervening time to provide economies in thermal performance and meet the competition of more efficient form of propelling machinery. Most modern engines using superheated steam make use of cam-operated valves which result in improved mechanical efficiencies and enable separate passages to be arranged for the admission and exhaust of the steam to and from the cylinders exposed to high temperatures, so that heat transfer losses are minimized. The use of poppet valves in these circumstances finds favour in one quarter, but equally satisfactory results are being obtained with independent quadruple-opening balanced slide valves. A number of designs have made use of the uniflow or semi-uniflow principle to release the steam from the last stage of expansion to the condenser. Large passages are required in the low-pressure cylinders for exhausting the attenuated steam, else the carry-over loss becomes excessive because of the resistance to flow, and these are most effectively provided in this way. Uniflow cylinders have the further advantage of reducing condensation losses at the low-pressure end of the engine where they tend to be greatest.

Superheat

The manner in which superheat improves the performance of steam machinery is, however, being ignored in the persistence with which multi-expansion engines continue to be employed on a wide scale, and this aspect should receive closer study because of the possibilities offered for simplification of the machinery which would enhance the advantages already obtainable with reciprocating engines in respect of maintenance costs. The two-stage compound engine became the accepted type when the advantages of expansive working were first established, but the triple-expansion engine superseded it as working pressures increased because the greater sub-division of heat drop reduced the condensation losses in the individual cylinders. The quadruple-expansion engine, with further increase of working pressure, was adopted later to provide higher economy. Cylinder condensation losses, however, lose much of their importance if sufficiently high superheat is employed to maintain the steam in a dry state through the greater part of its expansion, and this is provided for with the steam temperatures that are being regularly employed at the present time. Experience has shown that two-stage compound working is as efficient as triple or quadruple expansion at normal pressures when steam temperatures of about 600deg. F. are used, and mechanical and manufacturing advantages are gained through the elimination of the third and fourth stages of expansion.

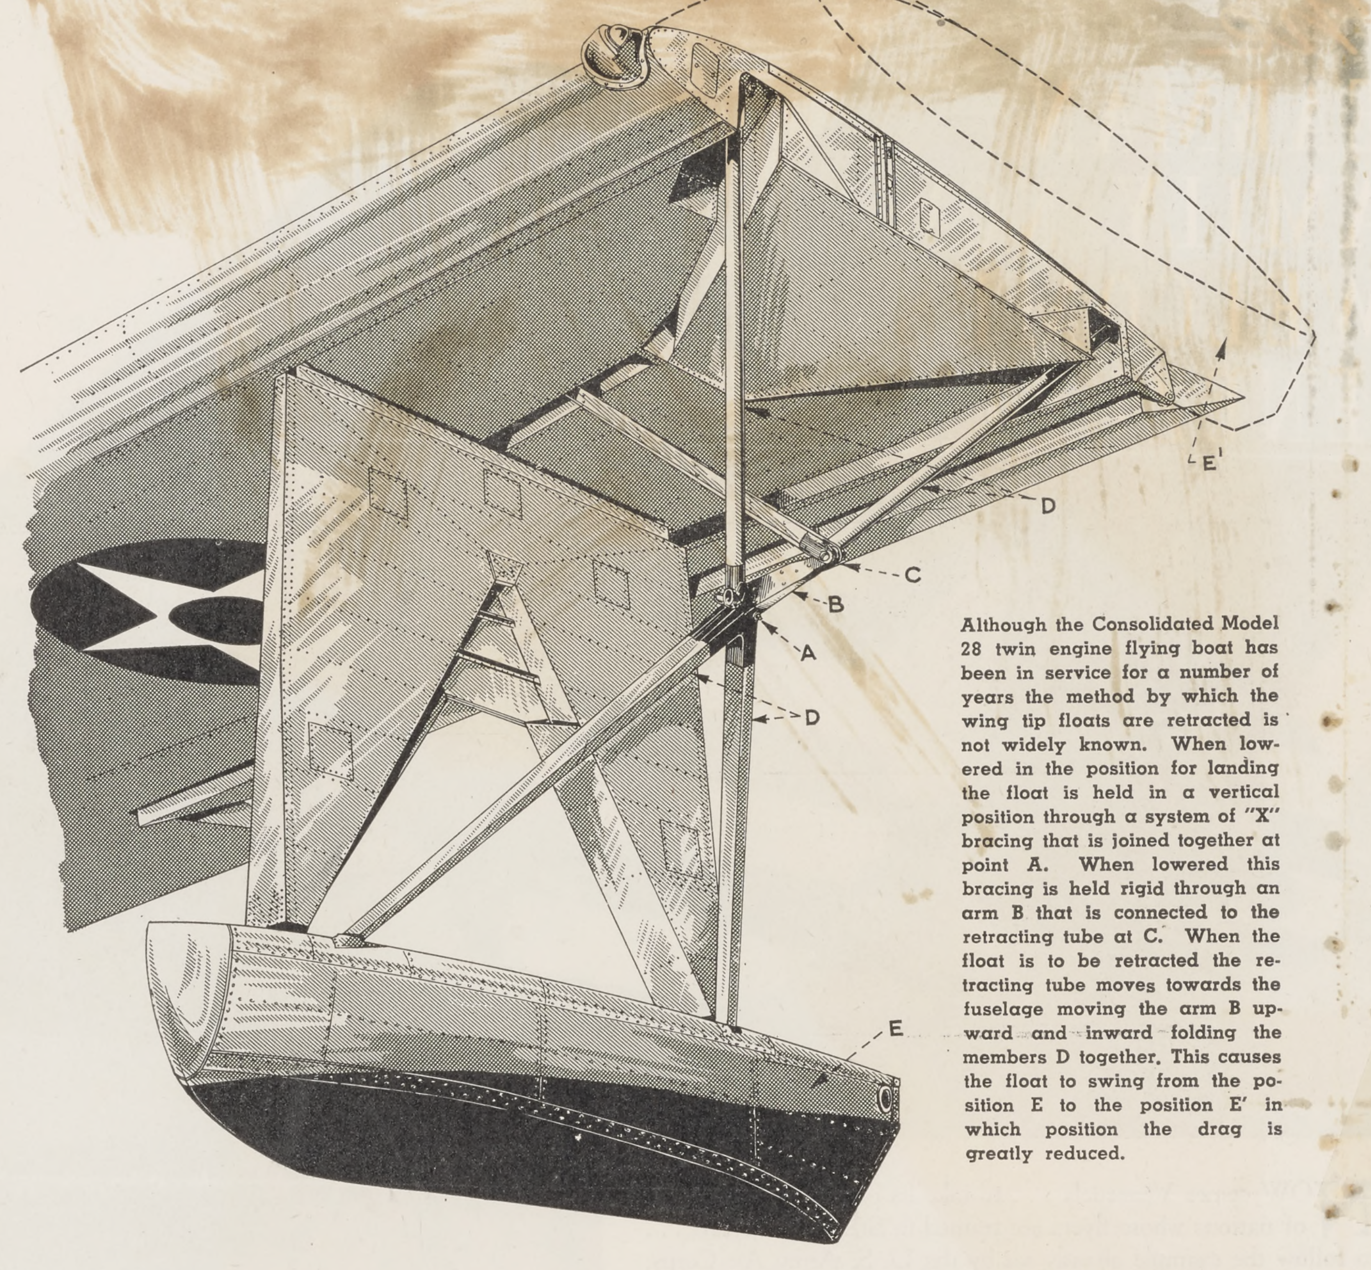
Two-stage Compounds

The earlier designs of the resuscitated two-stage compound engine, developed in Continental practice during recent years, were arranged with four cylinders to give a better degree of balance and turning effort and also for the sake of flexibility in manoeuvring, but the most recent tendency has been to employ three cylinders with the expansion carried out in one high-pressure and two low-pressure cylinders working in parallel. One early design of this type, fitted with hydraulically operated independent steam and exhaust slide valves, was brought out in this country and appeared very promising, but the development was not proceeded with. More recently an engine of somewhat similar design, having separate steam and exhaust double-beat poppet valves, hydraulically operated on the Meier Mattern system, was produced by the Werkspoor Company and fitted in the steamer Batavier III, with very satisfactory results.

Particulars have just been published of another design of two-stage compound engine, developed by the Stork Company at Hengelo, just before the occupation of Holland, which produces an exceptional degree of economy. The engine has one high-pressure cylinder of 550mm. diameter and two low-pressure cylinders of 900mm. diameter, with a common stroke of 800mm., developing 1,500 i.h.p. at about 125 r.p.m. The high-pressure cylinder is fitted with a piston valve having chrome-hardened surfaces on the working parts, and it has been shown that the wear of the liners is greatly minimized when using superheated steam, with a great improvement in steam tightness. Admission to the low-pressure cylinders is controlled by an improved form of balanced slide valve, which incorporates a relief in the valve cage to give communication between the cylinder space and steam receiver if any excessive rise in compression pressure occurs. Hackworth valve gear is fitted to provide an engine of very small dimensions. The low-pressure cylinder exhausts on the uniflow principle, and the trial results showed a fuel consumption of about 1lb. of coal per h.p. hour, an improvement of 15 to 20 per cent. on the standard triple-expansion engine working with similar steam conditions of about 200lb. steam pressure and 600deg. F. temperature.

AVIATION - June 1940

Charles F. McReynolds
9121 Dalton Ave., L.A.



Although the Consolidated Model 28 twin engine flying boat has been in service for a number of years the method by which the wing tip floats are retracted is not widely known. When lowered in the position for landing the float is held in a vertical position through a system of "X" bracing that is joined together at point A. When lowered this bracing is held rigid through an arm B that is connected to the retracting tube at C. When the float is to be retracted the retracting tube moves towards the fuselage moving the arm B upward and inward folding the members D together. This causes the float to swing from the position E to the position E' in which position the drag is greatly reduced.

Looking aft inside of the fuselage of the Model 28 shows the Zee stringers running lengthwise and the beltframes running crosswise. The large bulkheads in the rear are the 'banjo' bulkheads which extend on up into the fin structure. The tunnel door or hatch is shown on the keel while the two vertical tubes in the foreground are flare tubes.

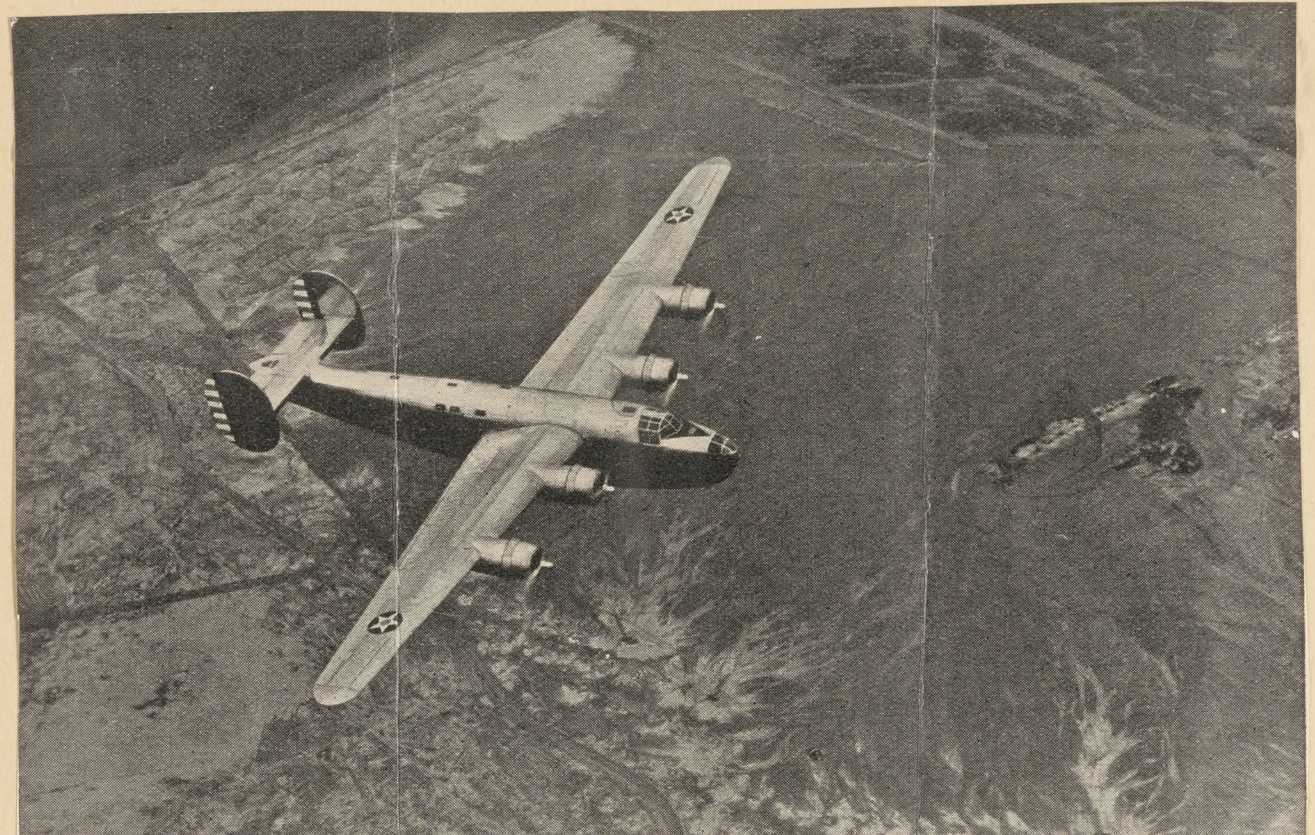
Flight — 7/28/40



A HEAVY AMERICAN: The Consolidated XB-24 bomber (four Pratt and Whitney Twin Wasps) which weighs about 40,000 lb., has a span of 110 ft. and carries a crew of from six to nine persons depending on the job to be undertaken. There is a turret in the tail. The machine is known by the makers as the Model 32 and the wing, of high aspect ratio, is of similar design to that used on the Model 31 flying boat.

THE AIR SERVICES

Consolidated Bomber Tested at San Diego

Now undergoing tests at San Diego, the new Consolidated Model 32 four-engined land bomber marks Consolidated's re-entry into the land plane manufacturing field.

The Model 32 is a full cantilever, all-metal plane, powered with four Pratt & Whitney 14 cylinder twin row radial air-cooled engines rated at 1200 hp each. The propellers are Hamilton Standards of the 3-bladed Hydromatic constant speed type, 12 ft. in diameter. Fowler flaps extend inboard of the ailerons in the wing, with the engine nacelles mounted flush with the upper surface of the center section.

Approximate gross weight of the airplane is 40,000 lbs.; wing span, 110 ft.; length 64 ft.; and overall height, 19 ft. Tactical requirements are for a crew of from 6 to 9, depending upon the mission to be performed.

Control surfaces are fabric covered and fully counterweighted. A full cantilever horizontal stabilizer has twin fins and rudders mounted at the tips. The all-metal stressed skin fuselage is equipped with hatches and windows in the nose, tail, turtledeck, back and bottom. The landing gear is of the tricycle type with a single retractable wheel forward. Main landing wheels retract into the wing wells.

While performance figures are not available, an official release indicates a speed of more than 300 mph, a range of approximately 3000 miles, and a bomb carrying capacity of approximately 4 tons.

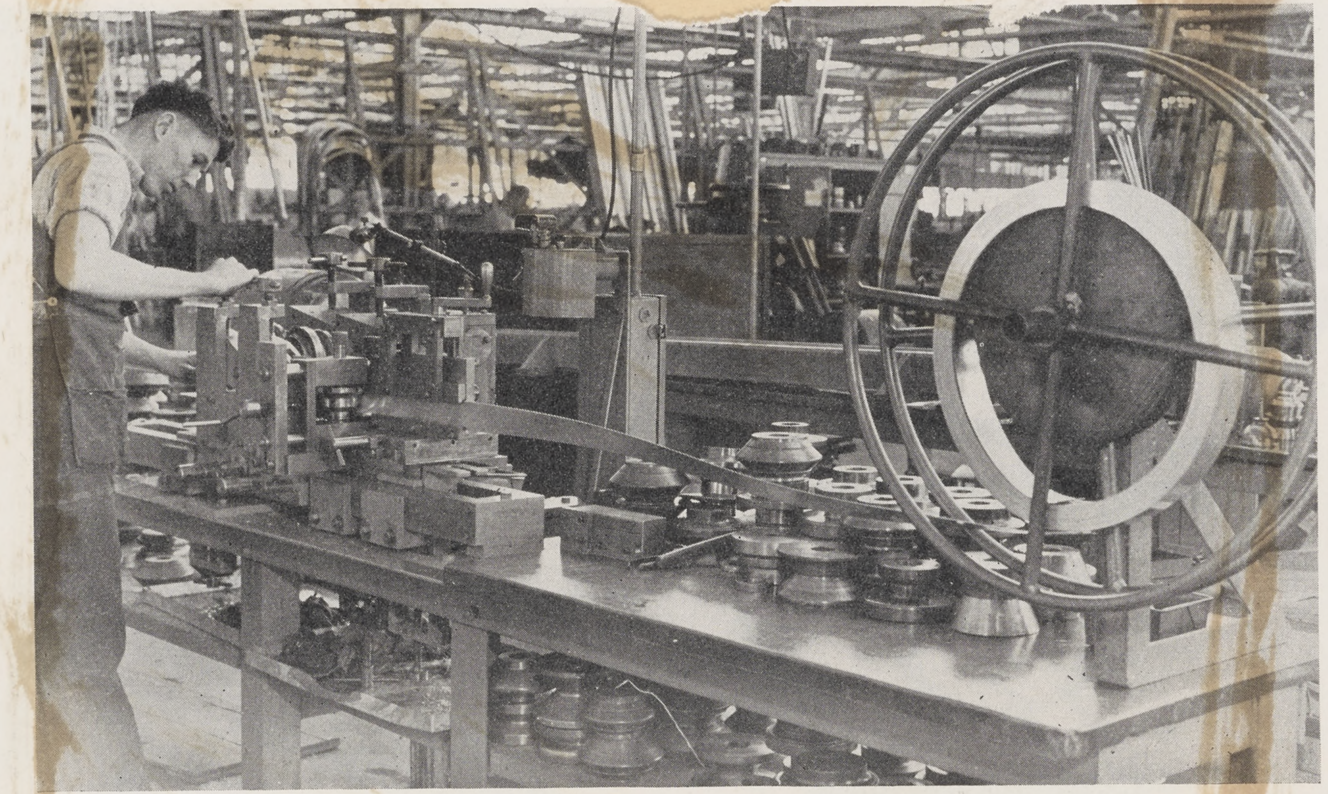
JUNE '40

AMERICAN MACHINEST
JUNE 26 1940



In the manufacture of complex structural shapes for plane construction, coiled strip stock is passed through adjustable guides and into a series of forming rolls. The rolling machines, working three shifts a day, turn out thousands of feet of light sections for stringers and reinforcements throughout the airplane

Plane parts from strip stock

BY LARRY BOEING, INSPECTOR, CONSOLIDATED AIRCRAFT CORPORATION

If roller-type dies are used properly, complex structural shapes can be rolled to shape quickly. Easy fastening and speedy production result

MACHINES OF ALL KINDS used in aircraft production work are humming with activity these days in the plant of Consolidated Aircraft Corporation. This firm recently received the largest single aircraft order in the history of American aviation, totaling $20,016,699, including an unspecified number of twin-engine patrol bombers of the PBY type for the United States Navy. (Ed. Note—Since this article was submitted a strong rumor has developed that Consolidated is being favored for a $50,000,000 order from England for patrol bombers similar to the PBY type.)

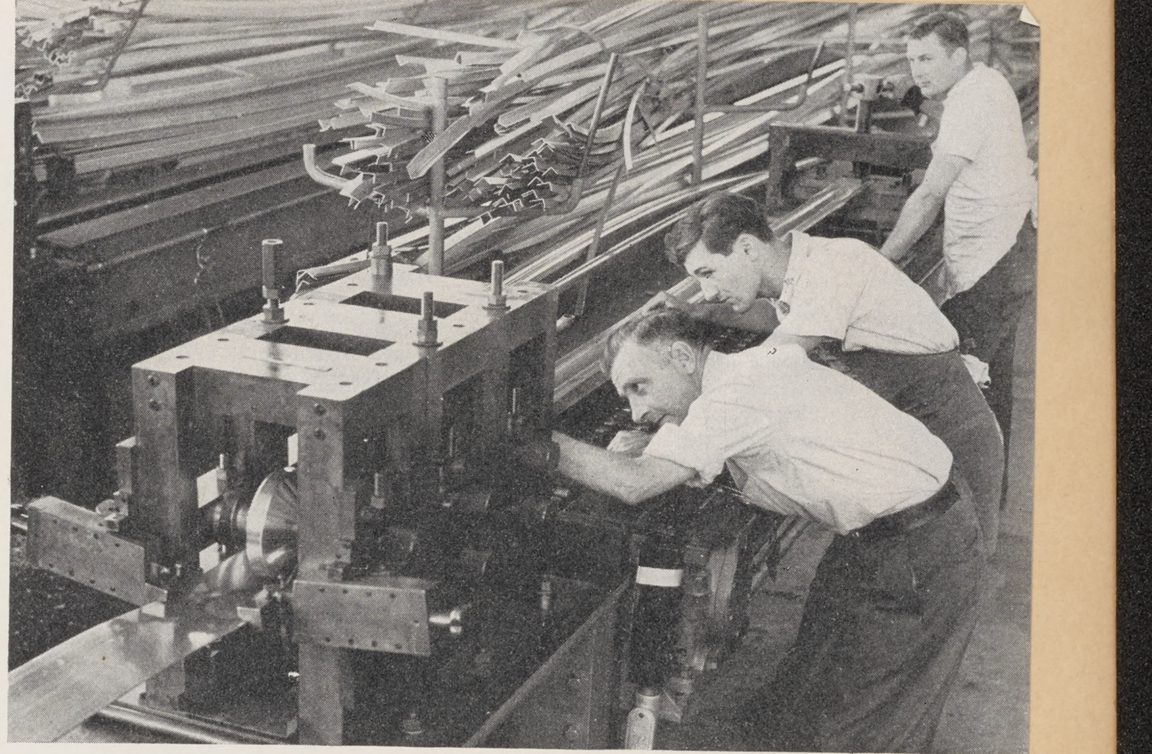
In order to facilitate production of the recent huge order for patrol-bombers, and other types of planes in production, Consolidated is now building plant extensions that will almost double the existing factory. Important additions are being made to the already extensive machine tool equipment, which has been found indispensable to large scale production of such aircraft. One of the key processes among the many employed at Consolidated, is the draw bench.

The draw-bench department is the nearest thing to large quantity production machine operation in the plant. Here many thousand feet of special light alloy structural sections are produced monthly. The department is important because a large proportion of thin-walled light alloy structural members must be used in large aircraft to attain maximum structural efficiency.

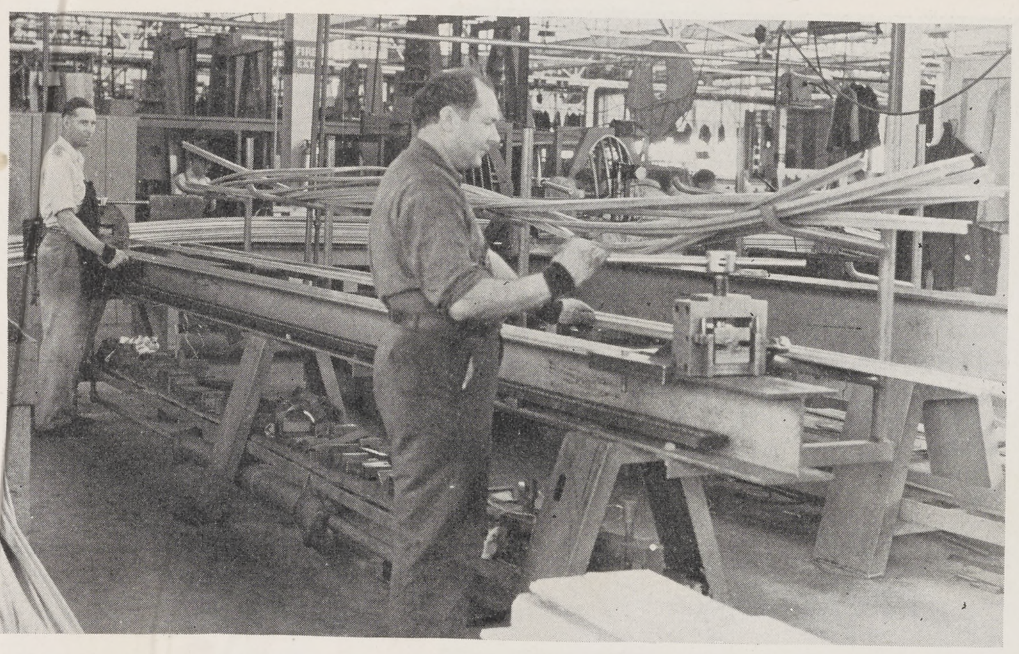
In the past, with certain aircraft designs, wide use has been made of round, square, or oval tubing, and special sections. Considerable use is also made of plain angle sections and of extruded alloy structural members. But for maximum speed and economy of production, and for ease of forming and fastening, the drawn section has been found most suitable.

By use of the drawing process, through employment of suitable rolls, it is practical to form complex sections from tin strip stock, suiting the section to the particular purpose it is to serve in the structure, thus promoting ease of assembly with other structural members, accessibility for riveting, painting and inspection. These parts are usually formed of Alclad, which is a strong aluminum alloy protected on each surface by a thin coating of pure aluminum. Added to other drawing and forming problems is the requirement that this protective coating must not be damaged in the forming process. These light formed sections are used in straight pieces as stringers for both wing and hull, hundreds of feet being incorporated in a single airplane for fore and aft forming in the hull, and as attachment members for the sheet-metal covering, or as attachment supports and skin stiffeners along the span of the wing. Straight drawn sections can also be formed to various contours by rolling

Precisely rolled sections depend on accurate adjustment of the roller-type dies. Such adjustment is here being made to form 50-ft. angle sections from 0.128 in. thick aluminum alloy ➡



Forming and heat-treating the sections result in some distortion. They are straightened in this pneumatically operated stretching machine; the cold-working resulting therefrom increases their strength ⬇



A form jig is used to set some of the rolled sections to final shape. The adjustable blocks are set to a given contour so that sections bent in rolls to approximate shape can be worked with a rawhide hammer to the contour desired ⬇

the current backlog.

Consolidated Aircraft Corp.'s backlog of $71,000,000 is about evenly divided between United States military work and orders for the Anglo-French. Only very recently the Allies came into the market for the flying fortress type of planes, a field in which Consolidated has achieved considerable success. In past years, Consolidated has been a principal source of supply for United States Navy needs. In the light of estimates that the Navy Department will increase its strength to 10,000 planes at a cost of $1,000,000,000, Consolidated should figure prominently in this connection.

Pacific Coast Edition
THE WALL STREET JOURNAL

Approximately half of the $71,000,000 backlog of Consolidated Aircraft is for the account of the United States Army and Navy. However, it is indicated that the backlog includes some substantial business for flying boats from the Allied commission. Vultee Aircraft, Inc.'s backlog of $14,500,000 includes $6,000,000 of work for the United States Army and $9,000,000 for account of the Swedish government, the latter backed by deposit of funds in this country.

These are a few of the stories which have appeared in the past few months in the BOSTON NEWS BUREAU concerning your company.

CONS. AIRCRAFT'S RECORD BACKLOG

With $70,000,000 Business On Its Books Full Operations Of Enlarged Capacity Assured For Next 2½ Or 3 Years

New York—Consolidated Aircraft Corp., with $70,000,000 of business now on its books—$15,000,000 more than its total sales in the previous 16 years of its existence— appears assured of full operations in its enlarged capacity during the next two and a half or three years.

With the recent addition of large orders from the Allies, Consolidated's backlog is believed to be 47% in foreign orders, with the remaining 53% accounted for largely by the United States Army and Navy. Based on past performance and taking into consideration the allowable profits under the Vinson Act, profits on the domestic military business should average about 12% of sales. On foreign deliveries net income of around 20% of sales is a reasonable expectation.

Officials of Condolidated say the company is in an excellent position to expand not only for additional foreign orders, but to meet the demands of the United States Government under President Roosevelt's recommendation of a productive capacity in this country of 50,000 planes.

Aircraft Expansion Those in the trade say the expense of expanding the productive capacity of the American aircraft industry will be lifted substantially if President Roosevelt's suggestion of large plants in the interior areas is accepted. Enlarging capacity by expansion of existing plants is the most economical method, they say, citing as an example the case of Consolidated Aircraft Corp. at San Diego, Calif., which increased its assembly floor space simply by paving its grounds. At present the "plane capacity" is about equally divided between the east and the west coasts.

The Middle West has a number of manufacturers of small commercial craft. Curtiss-Wright is building its new transports at St. Louis. The two big major engine producers are on the Atlantic seaboard,—Curtiss-Wright and United Aircraft. Allison, gearing up for large capacity within a few months, is in Indiana.

AVIATION MAN

Allies Take Option on 8000 U. S. Planes More Than 4500 Have Been Delivered

Washington (AVIATION BUREAU)—Reason for all the confusion about what's in the Allied airplane orders is that the estimators, quite literally, don't know what they're talking about. Actually the order is something of a fiction; no contracts have yet been signed. What has happened is that preliminary agreements have been made, but just about as binding commitments have been made on a great many more airplanes. When Chairman Purvis of the Allied Purchasing Commission announces figures he could just as well use a larger or a smaller amount; more dollar figures will be announced at whenever seems to the Commission to be the most politically propitious moment.

Options, of varying degrees of firmness, have been taken on 5,200 bombers and 2,800 pursuit ships for delivery in the next eighteen months or so. The difference between the two types reflects the Allied weakness in long-range equipment which was so graphically revealed in Norway. Engines for the airplanes are being bought separately because the commission is having to pay the cost of the plants to build its orders. About 5,000 engines (3,600 of them Allisons) have been definitely lined up, and more are implicit in the plant construction agreements being worked out with Allison, Pratt & Whitney, and Curtiss-Wright.

Of the medium bombers, it is known that Lockheed will build about 700, and 4,250 will be divided between Martin and Douglas, each producing at a rate of about 150 per month. Martin will fill its entire order, but Douglas will probably subcontract some to Boeing and Consolidated.

Bulk of the pursuits will be furnished by Curtiss-Wright, which is to build 1,500 P-40s; this order will be switched over to the more advanced P-40D as soon as this model gets into production. About 800 P-38s will be bought, but Lockheed, busy with bomber manufacture, will probably subcontract this entire order to its Vega subsidiary and to Vultee. Bell will furnish 200 Airacobras (P-39), and where the remaining 300 will come from is uncertain; perhaps Republic or Vultee or possibly Bell.

Orders are about ready to be signed (this is roughly equivalent to the announced $200,000,000) on the Curtiss and Bell ships, on 250 of the Douglas bombers, and on the engines. Contracts will incorporate very favorable cancellation clauses, providing not only for all the manufacturer's out-of-pocket costs, including commitments to material suppliers, but also for the entire profit which the manufacturer would have made if the order had been completed.

This new program of purchases followed the release for export of nearly all the latest type airplanes available here. These include Lockheed's P-38 two-motored interceptor and Hudson light bomber; Bell's Airacobra and Airacuda, single-engine and two-engine fighters respectively; Curtiss-Wright's P-40 single-engine pursuit and the improved version, the P-40D; two light Douglas and Martin attack bombers; and the big Consolidated four-engine bomber. Also released was the Grumman Skyrocket, a two-engine naval fighter for operation from carriers.

At the same time the Army deferred delivery on its orders for these types to give the Allies right of way. The arrangement is that when the Army does take delivery it will receive the latest models then available instead of the ships called for in its present contracts. The Allies will pay the cost of retooling and research for these hypothetical later models.

Before the new setup went into effect Allied orders since war started amounted to about 4,500 ships, costing something like $400,000,000. About 3,000 of these have already been delivered, according to Admiral Towers of the Navy Bureau of Aeronautics. This is rather higher than previous estimates. In any case it does not mean that 3,000 planes have been sent overseas. Actual shipments are still running around 200 per month, and the warehouses are filling up.

NEWEST BOMBER TRIED OUT

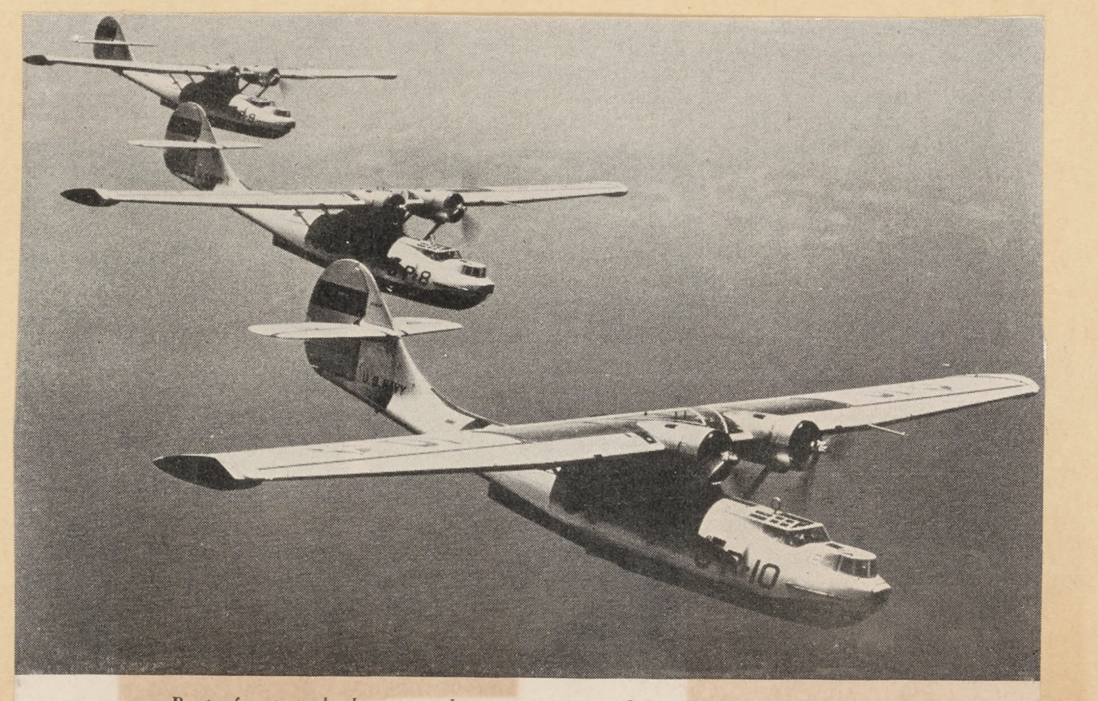
A BIG new United States bomber, first of a fleet which it is reported Britain is to get, has had its first tests at San Diego, California.

It is the Consolidated Aircraft Company's four-motored B24.

The B24, states an Associated Press cable from San Diego, carries four tons of bombs and a crew of nine.

Its top speed is about 300 miles an hour, its maximum flying distance 3,000 miles.

Officials of the company declined to say how many of the planes will be delivered to the R.A.F.

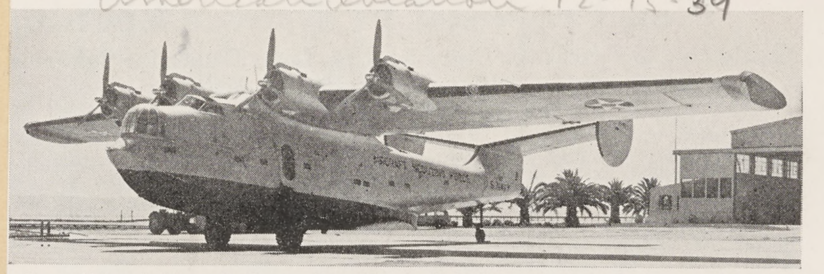


Part of a patrol plane squadron en route to Coco Solo from San Diego

Aero Digest Feb. 1940

XPB2Y-1 Becomes 1st Navy Flagplane

American Aviation 12-15-39



Consolidated Aircraft Corp., San Diego, Cal., has announced that on Aug. 24, 1939, the four-engine XPB2Y-1, shown above, became the first airplane to be officially recognized as a Flagplane of the U. S. Navy. On that date, Adm. A. B. Cook, commanding the aircraft squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the *U.S.S. Memphis* at Seattle, and hoisted it aboard the XPB2Y-1, thereby establishing a precedent in naval history. The plane, by formal procedure, became the first Flagplane ever to fly for the Navy, since never before had such a flag been officially hoisted on an airplane. The plane had been flown to Seattle by Navy personnel commanded by Comdr. Andrew Crinkley. *(Official U. S. Navy photograph).*

NEW PLANE ORDERS FOR CONSOLIDATED

New York—Consolidated Aircraft Corp. announced "large additional orders" from French and British governments. Unfilled orders now approximate $70,000,000. Backlog prior to this business having been estimated at $49,000,000, indicated volume of new Allied orders is around $21,000,000.

CONSOLIDATED AIRCRAFT CORPORATION

To eng

the current backlog.

Consolidated Aircraft Corp.'s backlog of $71,000,000 is about evenly divided between United States military work and orders for the Anglo-French. Only very recently the Allies came into the market for the flying fortress type of planes, a field in which Consolidated has achieved considerable success. In past years, Consolidated has been a principal source of supply for United States Navy needs. In the light of estimates that the Navy Department will increase its strength to 10,000 planes at a cost of $1,000,000,000, Consolidated should figure prominently in this connection.

The Lockheed Aircraft

Pacific Coast Edition
THE WALL STREET JOURNAL

Approximately half of the $71,000,000 backlog of Consolidated Aircraft is for the account of the United States Army and Navy. However, it is indicated that the backlog includes some substantial business for flying boats from the Allied commission. Vultee Aircraft, Inc.'s backlog of $14,500,000 includes $6,000,000 of work for the United States Army and $9,000,000 for account of the Swedish government, the latter backed by deposit of funds in this country.

These are a few of the stories which have appeared in the past few months in the BOSTON NEWS BUREAU concerning your company.

CONS. AIRCRAFT'S RECORD BACKLOG

With $70,000,000 Business On Its Books Full Operations Of Enlarged Capacity Assured For Next 2½ Or 3 Years

New York—Consolidated Aircraft Corp., with $70,000,000 of business now on its books—$15,000,000 more than its total sales in the previous 16 years of its existence— appears assured of full operations in its enlarged capacity during the next two and a half or three years.

With the recent addition of large orders from the Allies, Consolidated's backlog is believed to be 47% in foreign orders, with the remaining 53% accounted for largely by the United States Army and Navy. Based on past performance and taking into consideration the allowable profits under the Vinson Act, profits on the domestic military business should average about 12% of sales. On foreign deliveries net income of around 20% of sales is a reasonable expectation.

Officials of Condolidated say the company is in an excellent position to expand not only for additional foreign orders, but to meet the demands of the United States Government under President Roosevelt's recommendation of a productive capacity in this country of 50,000 planes.

Aircraft Expansion Those in the trade say the expense of expanding the productive capacity of the American aircraft industry will be lifted substantially if President Roosevelt's suggestion of large plants in the interior areas is accepted. Enlarging capacity by expansion of existing plants is the most economical method, they say, citing as an example the case of Consolidated Aircraft Corp. at San Diego, Calif., which increased its assembly floor space simply by paving its grounds. At present the "plane capacity" is about equally divided between the east and the west coasts.

The Middle West has a number of manufacturers of small commercial craft. Curtiss-Wright is building its new transports at St. Louis. The two big major engine producers are on the Atlantic seaboard,—Curtiss-Wright and United Aircraft. Allison, gearing up for large capacity within a few months, is in Indiana.

Aircraft Industry's Position

Coast Plants Preparing for Huge Task Of Supplying America's Defense Needs

This is the first of a series of articles on the aircraft manufacturing industry, its condition, resources and other vital factors underlying its confidence that it can by its own efforts meet demands of our national rearmament. From the men who have played an important role in bringing the industry to its present stature, and from facts gathered from independent sources, the writer sought and obtained views and facts on which American aircraft manufacturers base the confident prediction that President Roosevelt's demand for an eventual production of 50,000 aircraft a year can and will be met.

During the course of the survey, the writer talked with Donald W. Douglas, president of Douglas Aircraft Co., Inc.; Robert E. Gross, president of Lockheed Aircraft Corp.; Richard W. Millar, president of Vultee Aircraft, Inc., and representatives of other units on the West Coast from whose production lines roll more than half of all the aircraft produced in the United States, and from whose drafting boards and research laboratories have come the fighting ships conceded to be second to none in the world.

By Louis F. Holtzman

When President Roosevelt a month ago warned the nation it must rearm itself to "make our defense invulnerable, our security absolute," by gearing America's productive capacity up to 50,000 planes a year, the aircraft industry unhesitatingly said: "We can do it."

Much water has gone under the bridge since that time. Powerful nations have disintegrated, defenses have crumbled and democratic institutions in war-torn Europe have given way before the most powerful war machine in the history of civilization.

In these moving and tragic events, the airplane has played a major role. In the light of its performance, its power of destruction and of defense remain unchallenged. President Roosevelt's demand for immediately increased aircraft production, and the industry's confident assurances that this can be accomplished remain the nation's number one defense problem.

Smooth Acceleration of Output Seen

To get, if possible, an answer to the problem or at least obtain some outline of how the industry stands today after a month of intensive study, preparation and survey, the writer asked the managements of some of America's largest aircraft factories for the facts. Here is the picture as of today, a view produced by a survey of the Pacific Coast segment of the industry which now has more than 50% of the nation's aircraft productive capacity, and is rapidly adding to the whole.

Within the last four weeks the aircraft plants on the Pacific Coast have increased their personnel by 6,000. In addition to the five major plants located in the Los Angeles area, the figures include those of Consolidated Aircraft Corp. at San Diego and Boeing Aircraft Co. at Seattle. Moreover, additions to personnel have been going on steadily and at approximately this pace since last fall. The progress attained within the last month serves to gauge what has been accomplished so far.

Increase in Personnel

Within the last four weeks, additions to personnel by the various companies are as follows: Douglas Aircraft, 1,000; Lockheed, 1,300; Consolidated, 1,000; North American Aviation, 500; Vultee, 1,000; Boeing, 1,000; Northrop Aviation, Inc., 200.

These plants have initiated within recent weeks or have under consideration immediate expansion of plant facilities totaling approximately 2,000,000 square feet, as against the present national productive capacity under roof of approximately 7,000,000 square feet. Large additions to working capacity have been announced or are contemplated by Douglas, Lockheed, Boeing, Consolidated, Vultee, North American, Northrop and Vega Airplane.

By efficient coordination, the manufacturers interviewed say, America's defense problem in the air can be solved without interference with industrial activities in the automotive, ordnance and other industrial lines which make up the sum total of a nation's defense program. In other words, they say, the rapid construction of tanks, machine guns, anti-aircraft guns, ammunition and the hundred and one other items in which skilled labor and machine tools are required can and must be allowed to proceed without interruption while airplanes are being built.

These companies within the last few weeks have completed studies and have accelerated

Aircraft

Continued from First Page

engineering on types of military craft which the Government is expected to include in its rearmament program to a point where in many instances only the go-ahead signal is necessary to start augmented large-scale production without delay.

On the basis of the surveys and information obtained from eastern manufacturers, the men at the helms of the large aircraft plants on the Pacific Coast feel confident that they can begin promptly and without much difficulty to fill all demands for airplanes immediately needed by the Government, and at the same time begin to increase their productive facilities as rapidly as additional orders for 1942 and 1943 are placed by the United States Army and Navy.

Plants Not Now at Capacity

In all these surveys and discussions, three things stand out unmistakably:

1. Production of military aircraft in the United States will depend upon the ability of the engine manufacturers to build the necessary power plants.

2. Construction of military aircraft within the next year or two undoubtedly will be in proportion to the Government's ability to absorb into its fighting services this new production. In turn, this is dependent upon the success of the Government's military training program to produce qualified flyers ready to operate these new fighting planes in any large amount.

3. The speed with which President Roosevelt's National Defense Board succeeds in eliminating material and parts bottlenecks will set the tempo of the aircraft industry's acceleration to the goal of 50,000 airplanes a year.

Contrary to popular notion, and with England, France and other countries in desperate need of aircraft, the producing plants have not been working at capacity. They have been awaiting the word from the United States Government, or even from the Allied warring governments, to go ahead at an increased pace if and when they could.

For instance, Douglas Aircraft, operating the largest organization in this country, is one of the few operating a three-shift basis six days a week. Even so, it is at only 80% of capacity.

Present Capacity Not in Full Force

The company's employment roster at the two plants, Santa Monica and El Segundo, Calif., exceeds the 18,000 mark, or roughly 25% of the total of skilled labor in the industry. Douglas' backlog of work is now $140,000,000, including some $23,000,000 of commercial work. Plant capacity without additional physical expansion could probably be extended to 25,000 men, if economy were no consideration.

The Lockheed Aircraft Corp. plants at Burbank, Calif., with 9,000 employes, are operating on one and one-half eight-hour shifts five days a week with a backlog of unfinished work of close to $120,000,000. Establishment of a three-turn eight-hour shift basis seven days weekly could utilize probably 15,000 employes and treble output.

Consolidated Aircraft Corp. at San Diego, with a backlog of $71,300,000 and an employment of 6,650, is operating at 80% of present productive and personnel capacity.

Vultee Aircraft, Inc., plant at Downey, Calif., only last week announced it would step up immediately to full present capacity on production of military aircraft. Since the first of the year, employment has been increased 150% to 3,300 employes. Present backlog, including $3,000,000 of United States Army work, is $14,750,000. The plant is now operating on a single turn seven-day week basis.

North American Aviation's Inglewood, Calif., plant, with a backlog of $85,000,000 and employing 6,000 men, is operating only a two-shift daily basis six days a week. Additional personnel with present facilities would probably enable doubling of present output if necessary.

Most recent addition to the ranks of aircraft producers, Northrop Aircraft, Inc., has had its new plant at Hawthorne, Calif., operating since last February. Production started shortly thereafter on a sub-contract for tail assemblies for Consolidated Aircraft. The company is employing 700 at present and plans soon to get into actual production on a military order for the Norwegian government involving initially 24 high-speed heavily armed navy bombers. Present plant facilities and a personnel of 4,000, it is claimed, will build 50 single-engined aircraft monthly.

Doubtless, California plants could step up their production activity at least 20% without recourse to the new expansions. With these in full force and with a large backlog of few types, the industry can set a much higher record, probably 50% more, or even greater.

Why these huge, modern plants have not been operating at capacity, what factors not of the aircraft industry's making have combined to hold them back, and how the utmost of production at these plants can be obtained will be treated in subsequent articles of this series.

AVIATION MAN

Allies Take Option on 8000 U. S. Planes More Than 4500 Have Been Delivered

Washington (AVIATION BUREAU)—Reason for all the confusion about what's in the Allied airplane orders is that the estimators, quite literally, don't know what they're talking about. Actually the order is something of a fiction; no contracts have yet been signed. What has happened is that preliminary agreements have been made, but just about as binding commitments have been made on a great many more airplanes. When Chairman Purvis of the Allied Purchasing Commission announces figures he could just as well use a larger or a smaller amount; more dollar figures will be announced at whenever seems to the Commission to be the most politically propitious moment.

Options, of varying degrees of firmness, have been taken on 5,200 bombers and 2,800 pursuit ships for delivery in the next eighteen months or so. The difference between the two types reflects the Allied weakness in long-range equipment which was so graphically revealed in Norway. Engines for the airplanes are being bought separately because the commission is having to pay the cost of the plants to build its orders. About 5,000 engines (3,600 of them Allisons) have been definitely lined up, and more are implicit in the plant construction agreements being worked out with Allison, Pratt & Whitney, and Curtiss-Wright.

Of the medium bombers, it is known that Lockheed will build about 700, and 4,250 will be divided between Martin and Douglas, each producing at a rate of about 150 per month. Martin will fill its entire order, but Douglas will probably subcontract some to Boeing and Consolidated.

Bulk of the pursuits will be furnished by Curtiss-Wright, which is to build 1,500 P-40s; this order will be switched over to the more advanced P-40D as soon as this model gets into production. About 800 P-38s will be bought, but Lockheed, busy with bomber manufacture, will probably subcontract this entire order to its Vega subsidiary and to Vultee. Bell will furnish 200 Airacobras (P-39), and where the remaining 300 will come from is uncertain; perhaps Republic or Vultee or possibly Bell.

Orders are about ready to be signed (this is roughly equivalent to the announced $200,000,000) on the Curtiss and Bell ships, on 250 of the Douglas bombers, and on the engines. Contracts will incorporate very favorable cancellation clauses, providing not only for all the manufacturer's out-of-pocket costs, including commitments to material suppliers, but also for the entire profit which the manufacturer would have made if the order had been completed.

This new program of purchases followed the release for export of nearly all the latest type airplanes available here. These include Lockheed's P-38 two-motored interceptor and Hudson light bomber; Bell's Airacobra and Airacuda, single-engine and two-engine fighters respectively; Curtiss-Wright's P-40 single-engine pursuit and the improved version, the P-40D; two light Douglas and Martin attack bombers; and the big Consolidated four-engine bomber. Also released was the Grumman Skyrocket, a two-engine naval fighter for operation from carriers.

At the same time the Army deferred delivery on its orders for these types to give the Allies right of way. The arrangement is that when the Army does take delivery it will receive the latest models then available instead of the ships called for in its present contracts. The Allies will pay the cost of retooling and research for these hypothetical later models.

Before the new setup went into effect Allied orders since war started amounted to about 4,500 ships, costing something like $400,000,000. About 3,000 of these have already been delivered, according to Admiral Towers of the Navy Bureau of Aeronautics. This is rather higher than previous estimates. In any case it does not mean that 3,000 planes have been sent overseas. Actual shipments are still running around 200 per month, and the warehouses are filling up.

NEWEST BOMBER TRIED OUT

A BIG new United States bomber, first of a fleet which it is reported Britain is to get, has had its first tests at San Diego, California.

It is the Consolidated Aircraft Company's four-motored B24.

The B24, states an Associated Press cable from San Diego, carries four tons of bombs and a crew of nine.

Its top speed is about 300 miles an hour, its maximum flying distance 3,000 miles.

Officials of the company declined to say how many of the planes will be delivered to the R.A.F.

XPB2Y-1 Becomes 1st Navy Flagplane

American Aviation 12-15-39

Consolidated Aircraft Corp., San Diego, Cal., has announced that on Aug. 24, 1939, the four-engine XPB2Y-1, shown above, became the first airplane to be officially recognized as a Flagplane of the U. S. Navy. On that date, Adm. A. B. Cook, commanding the aircraft squadron of the Aircraft Scouting Force, by dispatch, removed his flag from the *U.S.S. Memphis* at Seattle, and hoisted it aboard the XPB2Y-1, thereby establishing a precedent in naval history. The plane, by formal procedure, became the first Flagplane ever to fly for the Navy, since never before had such a flag been officially hoisted on an airplane. The plane had been flown to Seattle by Navy personnel commanded by Comdr. Andrew Crinkley. *(Official U. S. Navy photograph).*

NEW PLANE ORDERS FOR CONSOLIDATED

New York—Consolidated Aircraft Corp. announced "large additional orders" from French and British governments. Unfilled orders now approximate $70,000,000. Backlog prior to this business having been estimated at $49,000,000, indicated volume of new Allied orders is around $21,000,000.

It Over

BY THOMAS F. WOODLOCK

All historians agree—at least more or less—that the ideology of the French Revolution was furnished by the intelligentzia of the preceding two generations, and the occasion by the collapse of political authority represented by the monarchy. This ideology rested mainly upon a concept of man essentially good, an imaginary being, a sort of noble savage but "adorned with all the graces and all the subtleties of millenary civilizations" (Pierre Gaxotte, *La Revolution Francaise*). "For 40 years France was full of these quite Parisian Iroquois, these highly civilized Persians, these Ingenus without ingenuousness. With their ironical wise-cracks, their contemptuous comparisons, their simulated surprises, they succeeded in troubling people's minds, in throwing doubt and disquiet into the stronger minds so as to represent as violence or usurpation the most ordinary rights, and as disturbing and illegitimate innovations, institutions which for centuries people had regarded it as an honor to respect and to serve." (Op. cit.)

Two foreign currents fed this stream of thought, one German and the other English. The German furnished the emotional element, as the poetry and literature—as distinguished from the philosophy—flowed from beyond the Rhine through Grimm and Huber. From England, through Prevost and Voltaire, came the more intellectual concept, that of a people made up of "savants and thinkers, worthy to give the world models of civism and virtue." (Op. cit.)

Gaxotte quotes Taine on what we might call the "Park Avenue Pinks" of the day as follows: "One sits at table surrounded by the refinements of luxury, among women smiling and well groomed, and men cultivated and charming, a choice company in which intelligence is quick and its give-and-take accurate. By the second course verve is exploding, sallies are crackling, spirits are flaming and sparkling. At dessert it is impossible to hold back the witticisms on the most serious matters. With the coffee come the questions: Is the soul immortal, and does

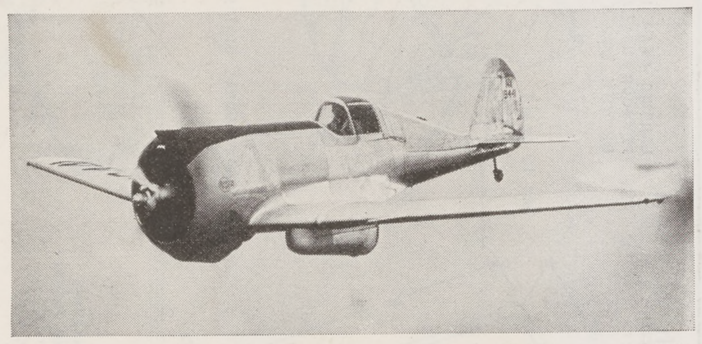
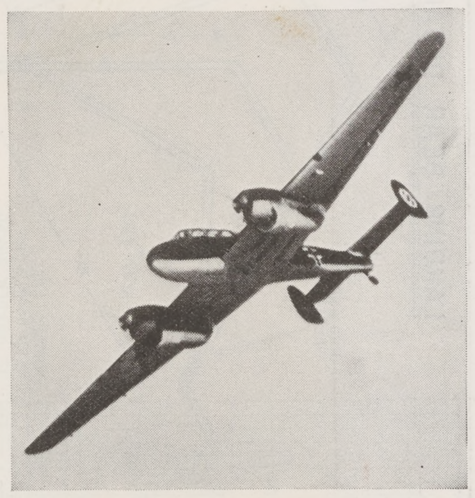
Highlights of the Latest Planes Produced For Use Here and Abroad

By ROBERT C. MORRISON



The Curtiss CW-21 climbs over 5,000 feet per minute with 1,000 hp.



The Messerschmitt 110, latest German pursuit plane designed to protect bombers

OUR recipe this month is mainly on how to prepare a Hitler stew a la American style . . . a dash of Curtiss and a Douglas here and there. It appears as though it will be Lockheeds that will really get the kettle boiling over there, however, as we hear rumor to the effect that it is not all peaceful twin-engined reconnaisance planes that will wend their way to England from the Lockheed plant. On the contrary, though Lockheed does not admit it, rumor says that they are working on a four-engined bomber for Great Britain . . . a version of the Lockheed Model 44 now abuilding for Pan-American Airways. It is a "small" four-engined airplane with plenty of that all-important speed which is what Great Britain needs in the way of a bombing plane for long expeditions into enemy territory. $1,700,000 now bristle on Lockheed's books as one of the sales for the "largest Lockheed ever built." Another order comes from Pan-American Airways totaling about $710,000 for three transports of similar design with an option on three additional planes that may be purchased at a later date. Though details are lacking on any four-engined bomber at this time, here is the dope on the Model 44 as sold to Pan-American.
